It is not certain that London, with all its great advantages to architectural students, is really the best place in which to serve an apprenticeship; it possesses the best architectural library, and has the best professors and the best classes, and perhaps the best buildings in progress; but to set against all these are the great and numerous distractions which render study so difficult, and the many temptations to neglect the hard labour of good husbandry for the some time pleasurable sowing of wild-oats. The country youth had better be articulated in some neighbouring town, rather than sent friendless into the heart of London.

Frequently, the student's career is made or marred during his pupilage; the channel into which his life is turned in those days leads, often unalterably, to success or mediocrity or ruin. He should be encouraged in his studies, assisted by the wise advice of a good master, and placed in competition with other students for the mutual sharpening of wits. Most towns of any importance possess architectural societies, in connection with which classes are held and prizes offered to students; he should be early enrolled a member of a society of this kind. Home-study is quite indispensable; and for this purpose the best elementary books on materials, sanitary science, construction, and the history and details of architectural styles, must be purchased by the pupil's parents. Part at least of every summer holiday ought to be devoted to sketching and measuring ancient buildings, castles and houses, cathedrals and village churches. Parents and sisters will do well to remember that a good architectural sketch is not necessarily a pretty picture, and that a very pretty sketch of a building may be utter rubbish in an architect's eyes and quite useless for purposes of study. Do not praise the lad's attempts at picture-making, and do not scorn his unintelligible measured drawings.

It may happen that the only return which a youth gets for his premium and for his three or five years of unremunerated service is the privilege of 'having the run of the office;' he is at liberty to keep his eyes and ears open, and to pick up what scraps of learning he can. Now and then, when work is slack, the master may suddenly bethink himself of neglected duties, and set his pupil to copy 'the five orders,' or to design a more or less grandiose building in a certain style. But these instructions are short and far between; and the student is thrown in the main on his own resources, or left to the tender mercies of the managing assistant. It is possible, too, that he may be kept for a long time at one kind of work—perhaps mere drudgery, such as printing or tracing or even copying specifications—and may gain little experience in design and in the higher branches of an architect's labour. It requires no little application and perseverance for a pupil to make much progress amid such discouraging surroundings.

One is fain to believe that such a haphazard mode of education—if education it can be called—is rapidly becoming a thing of the past. Cer-

tainly it is felt by all who have the best interests of the profession at heart that a more definite course of instruction is necessary. The education of architects is just now the theme of many speakers, and the London Architectural Association is engaged in discussing a scheme which may ultimately result in the formation of a College of Architecture.

Professor Roger Smith, in his opening lecture, delivered in October last to the architectural classes of the University of London, treated fully of the subject. A week or two afterwards Mr Leonard Stokes devoted his presidential address at the Architectural Association to the consideration of the same question. And at the recent Birmingham Congress of the National Association for the Advancement of Art, another excellent address was delivered by Mr T. G. Jackson, the President of the Architectural section of the Congress. These three papers were fully reported in *The Builder* during the months of October and November, and are well worthy of careful perusal by those whose sons are or are about to become students of architecture. Nor do these exhaust the list of recent utterances on the subject; but enough has been said to show that architects are beginning to see that, if architecture shall regain her ancient honours, some better method of training students must be educed than the utterly unsystematic one of 'having the run of an office.' Office-training is indispensable, but systematic study is likewise indispensable.

In order to encourage this systematic study, the Royal Institute of British Architects, which is the representative society of the profession, has established a course of progressive examinations—the Preliminary, the Intermediate, and the Final. The first—we quote from the Calendar of the Institute—'is to test the general knowledge of aspirants entering or who have just entered the profession.' Candidates who have passed certain examinations such as the matriculation and the junior or senior local examinations of any British university, and further, who can show due proficiency in geometrical and freehand drawing, are exempt from this examination. The Intermediate 'is intended to enable the candidate to show that he has been diligent in his studies, and has acquired a certain proficiency as a draughtsman;' and also 'to test his knowledge of the elementary principles of architecture both as an art and a science.' A student ought to pass it in the second year of his pupilage. Before he can sit for the final examination he must have attained the age of twenty-one years. For this last examination a considerable number of drawings of both artistic and constructional subjects are required, together with a knowledge of the history and details of the principal styles of architecture, the nature, application, and strength of building materials, constructive details, sanitary science (drainage, water-supply, ventilation, lighting and heating, acoustics), specifications and contracts, measurement and valuation of buildings, legislative enactments relating to building, and other things. In fact, this Final examination is, with some slight additions, the same as the one which all persons desiring to become Associates of the Institute have been required to pass since the year 1882.

The first preliminary examination was held

in November 1889; the second intermediate in March this year; and the first final will probably be held at the end of 1891 or in 1892. When the threefold system has been in full operation for some time, qualification by the present single examination will doubtless cease. To show that the examinations of the Institute are not mere matters of form, we may say that out of about one hundred candidates who sat for the examination for Associateship in 1890, only one-half satisfied the examiners, and were therefore eligible for election as Associates. An Associate is entitled to the affix A.R.I.B.A.; in due course he may become a Fellow of the Institute (F.R.I.B.A.); and these two are the only affixes which show that the person using them may have passed an examination in architecture. The great majority of the present *Fellows*, however, were admitted without passing the ordeal of examination; but it is highly probable that the admission of *Fellows* without examination will shortly cease; for the honour of the Institute, it is certainly desirable.

The system of progressive examinations is on its trial; but the number of pupils who have already presented themselves is so great that the success of the scheme seems assured. It offers far and away the best course of study hitherto propounded, and bids fair to become eventually the standard whereby the capabilities of the young architect are measured. Parents will do well to make it a condition in the indentures of apprenticeship that their son be allowed all reasonable facilities for study, so that he may in due course present himself for the several examinations, and if possible become an Associate of the Institute. The effect of the examinations on British architecture cannot but be for good; they will not of course ensure noble architecture, for good architects are born, not made—either by examination or by anything else—but they will at any rate keep those persons who have studied sufficiently to pass them from designing such ugly incongruous buildings as everywhere nowadays deface our streets and lanes.

A BURMESE GENONE.

CHAPTER IV.—CONCLUSION.

GEORGE FARNWOOD sat in a low chair, his head resting on his hand, while Mah Mee, crouching at his feet, told him how she had come to Rangoon. After he had left Shwaydoungyee, she said, her arm became very bad indeed, and she got fever. For more than a month she lay ill, and every one thought she was going to die; but when the cold season came round she got better, and began to watch for the messenger her lord had promised to send. She used to go and sit on the river bank where she could see the boats coming up, and the people knew she was expecting Tharnwoo' Thekin to send for her. At first they said nothing; but when one moon after another waned and no one came, the women began to laugh, and point their fingers at her when she passed, asking where was her English husband. She was very miserable, for her mother wished her to marry Moungh Pho, the cultivator, and was always saying Tharnwoo' Thekin had forgotten her. When she reminded

her mother that her lord had promised to marry her, Mah Lay said perhaps the gentleman was dead. Other people also admitted that Tharnwoo' Thekin always kept his word; and she grew anxious lest her mother should be right. So she determined to come to Rangoon herself to seek him.

It was not easy to get away from Shwaydoungyee, for Mah Lay would never have allowed her to leave had she known her purpose. But when the feast of the Full Moon of Taboung drew near, it brought the opportunity for which she was waiting. Moungh Wike and his wife were going to Maulmain to worship at the pagoda, and offered to take her with them in their big paddy-boat. Mah Lay was kind, and allowed her to accompany the old people. When they reached Maulmain she easily escaped from her friends, and found her way to the great fireship she was told would go to Rangoon; and having a few rupees, which her mother had given her to buy pagoda offerings, she was able to pay her passage. When she arrived in Rangoon she was much frightened by the crowds of strange people, and did not know where to go; but Mah Noo, a woman with whom she had made friends on board the steamer, offered to take her home and find out for her where Mr Farnwood lived. Mah Noo's husband was a policeman, so she was able to get the information. The moment she knew which way to go, she started to find his house; she was going there when she saw him riding with the lady. She had found him, and she was his slave.

'Did Moungh Louk not come to you at Shwaydoungyee?' asked Mr Farnwood, who had been expecting every next word of Mah Mee's story to relate to his mission.

'I have never seen him since he left with your honour last year,' answered Mah Mee, clasping his limbs to her breast.

George Farnwood lay back in his chair and remained silent for a moment or two; then he sat up and turned upon the girl as though refuting an accusation.

'Listen, Mah Mee!' he said. 'I kept my promise. Two months ago I gave Moungh Louk money, and sent him to bring you and Mah Lay to me in Rangoon.'

'But, my lord,' returned the girl in great surprise, 'Moungh Louk is your enemy. Your honour obtained punishment for him for running away from the dacoits, and he told many people in the village he would be revenged.'

'I understand,' said George Farnwood thoughtfully. It was all clear now. Moungh Louk, never dreaming but that love dictated the errand on which he had been sent, had undertaken it with the deliberate intention of defeating its end. There was no doubt about his method of proceeding. He had gone to Maulmain to pass the time he was supposed to spend travelling up to Shwaydoungyee, because to have remained here in Rangoon would have been to court detection. Those elaborately-detailed accounts were nothing more than a blind. The money had doubtless been spent in enjoying the little trip to Maulmain. Mr Farnwood promised himself a day of reckoning with Moungh Louk when that gentleman could be found.

'He never came to Shwaydoungyee,' said Mah Mee, breaking in upon his train of thought.

'He told me he had been, and that you had died of fever,' answered Mr Farnwood.

Mah Mee did not reply to this; she looked up with an unutterable joy in her eyes, as though to say, 'It does not matter now; I am here.'

But George Farnwood did not smile back upon her as he had been used to do. He looked over her head out into the compound with a hard, sorrowful gaze, which sent a cold shiver to Mah Mee's heart. She crouched nearer him, but he motioned her off gently, muttering words she did not understand.

'Do not stay with me longer now,' he said, rising; 'when you want to see me, you may come here.'

His tone awed the girl; she drew herself away, and sat for a few moments watching his face. The yearning, wistful look left her eyes. Her lord thrust her from him. But two moons had waned since he sent to bring her to his side; for two months he had believed her dead. It must be there was another woman now; and Mounng Louk's lie had done this. She rose from the floor, and pressing her hands together in a farewell *shikoh*, glided from the house without another word.

Soon after she had gone George Farnwood put on his hat and bent his way over to the Granes' bungalow, where Mabel was eagerly awaiting him.

'There is little to tell you,' he said. 'Mounng Louk played me false. The story of his journey to Shwaydoungyee and of Mah Mee's death was a lie from beginning to end: he never went near the place.'

'What are we to do, George?' asked Mabel, when she had heard all Mah Mee had told him.

'I do not know, darling,' he groaned; 'my head is in a whirl.'

'George,' said Mabel, taking a firmer grasp of his hands, as if to strengthen herself, 'I know perfectly what your difficulty must be. Let me help you. You shall go back to your work on Monday free; our engagement shall be at an end until we see our way out of this terrible state of things.'

George Farnwood did not answer, and she continued. 'You will be with father in Mandalay, and we shall be able to write to each other. I can't give you up altogether; but I want to set you free to act as you think right.'

He drew her nearer him and kissed her. 'It will be best,' he said. 'There will be no end of scandal and worry over the business, and your name must not be mixed up in it. We will decide nothing at present. I will go up to Mandalay and think over the position before we take any steps. I *can't* resign you; and I cannot bring myself to tell that poor girl I will not marry her, she has trusted me so implicitly.'

Mabel could not urge him to do it. She thought of Mah Mee sacrificing home and friends and all that made her simple life worth living; of the timid, ignorant daughter of the forests plunging blindly into the great city alone and penniless, upheld solely by George Farnwood's promise. She could not say more than she had done. She had set her lover free to do what his conscience directed, and left the rest in his hands.

When he left her, Mabel hastened to her own room and remained till her mother came in

search of her two hours afterwards. Her fortitude had been severely tried by the ordeal of parting; and only her determination to add nothing to George Farnwood's trouble enabled her to come through it with any show of composure.

But there still lay before her a task from which she shrank with nervous dislike. Her mother must be told that her engagement was at an end, and why; and recalling certain conversations, she felt the task would be a painful one indeed.

Herein, however, she proved mistaken. Mrs Grane was beginning to see the engagement in a more favourable light, for George Farnwood's appointment to be 'Personal Assistant' was an earnest of his future success; and, moreover, she could not fail to be influenced by the unanimity with which people who knew him only by report predicted a brilliant career for him. Hence, when she heard the story of Mounng Louk's perfidy and Mah Mee's appearance, she did not promptly remind her daughter how she had predicted these things; on the contrary, she joined Mabel in deploring the imposition that had been practised by the unscrupulous Burman, and spared no effort to console and reassure her. Their happiness, she declared warmly, should not be sacrificed to a quixotic promise. Mr Farnwood had done all that could be expected of him towards its fulfilment; and for her part, Mrs Grane considered he was not free to repudiate his engagement to Mabel now. No doubt, it was best that the matter should remain in abeyance for a time; and it would be well for Mabel to leave Rangoon also, until the chatter to which Mah Mee's arrival would inevitably give rise subsided.

'I think, dearest,' she said, 'you had better pack up at once and go over to the Windons in Maulmain for a little while.—Don't worry yourself about the matter needlessly. I shall write to your father to-night, and ask him to talk it over with George as soon as he goes up to him.'

And Mabel, thankful beyond expression that her mother was no longer in opposition, acquiesced with little demur in the suggestion that she should go away.

'If you don't mind being left alone, mother,' she said, 'I think I should like to go. I dread the talk and questioning there will be when the story comes to light.'

'Don't trouble about me, dear. You ought to know by this time that your mother has no lady-like dread of dacoits,' said Mrs Grane, smiling.

But before Mabel consented to telegraph her friends that she was coming over to see them, she obliged her mother to request the authorities to furnish the house with a guard every night. She could never grasp the strong-minded self-reliance which was her mother's chief characteristic.

'I'll do it to please you, Mab,' she said as she addressed her note; 'but it's only adding two voices to the concert of snores I hear when I waken at night. I don't believe any earthly power could keep a native sentry awake.' Which opinion Mrs Grane had arrived at after long experience.

The Mah Mee who left George Farnwood's house was a different woman from the Mah Mee

who had entered it half an hour before. She followed him all aglow with passionate love; she walked out a tigress, mad with a jealousy which blazed the more fiercely because she knew not against whom to turn it. She must give it some vent; and she determined to seek Moun Louk, who had been the means of estranging her lord. It was not difficult to discover where he lived. The husband of Mah Noo, who had, with true Burmese hospitality, given her shelter, was able to supply off-hand his address in the bazaar. He had known Moun Louk during his brief period of service in the Rangoon police; and when he told Mah Mee where she might find him, he added a word of warning not to have too much to do with that individual; he did not bear a good character nowadays. And Mah Mee, without even staying to share the mid-day meal, set off to look for the ex-sergeant. She found Moun Louk alone in his house, and was received with open arms. It was, he said, a great surprise to see her alive and well; he had heard that she was dead.

'Who told you I was dead?' demanded Mah Mee.

Moun Louk frowned in doubt for a minute, and shook his head slowly. It was strange, but the name of his informant had escaped his memory.

'I saw Tharnwo' Thekin an hour ago,' said Mah Mee, looking narrowly into the man's face, expecting to see some symptom of alarm there.

'Yes?' said Moun Louk, with an air of sympathetic interest. 'His honour had sent me to bring you to him; but having heard in Maulmain of your death I did not go on to Shwaydoug-ye. I returned to tell him of it. His honour was sorry to hear it; very sorry. He would be glad to see you again.'

'He sent me—from him,' said Mah Mee, with quivering lips.

'A-a-a-h!' returned Moun Louk, pityingly; 'I fear you have not heard the news. Something has happened to change Tharnwo' Thekin's heart.'

Mah Mee shot a glance of hungry ferocity at him, and clenched her hands convulsively while she waited to hear more. But Moun Louk was in no hurry to go on. It seemed to him that his betrayal of Mr Farnwood's trust, which he had since regretted, might after all furnish him with an instrument to wreak a vengeance bitter enough to satisfy his worst cravings, and he did not wish to make a false step by hasty speech.

Such an event as the engagement of the daughter of the *Sit-boh-gyee* or 'Great War Chief' who commanded the police, to an officer belonging to that body, could not well remain unknown to the rank and file when orderlies and messengers were about the house all day gossiping with the servants. Every constable in Rangoon knew that the dacoit-slaying officer from Shwaydoug-ye was to marry the daughter of the *Sit-boh-gyee* Ga-lane; indeed, a subscription to purchase a wedding present had been set on foot among the men, for the Colonel was very popular, and his daughter's marriage offered an opportunity of paying him an indirect compliment. Moun Louk, who had frequent intercourse with his old comrades, had been made acquainted with the

news soon after his return from Maulmain, and had thought a good deal about it in connection with Mr Farnwood's despatch of himself to bring Mah Mee.

'What has happened?' asked the girl, finding Moun Louk did not speak.

'It is said by the police,' answered the man with seeming reluctance, 'that Tharnwo' Thekin will marry the daughter of *Sit-boh-gyee* Ga-lane.'

Mah Mee drew a sharp sobbing breath; she knew now why her lord had thrust her from him.

'The feast which takes place when an Englishman marries has not yet been given,' said Moun Louk; 'they are not yet married.'

'They never shall be!' flashed Mah Mee in ungovernable passion.

'But,' continued Moun Louk, with an abstracted air, 'I think the ceremony must soon take place. Tharnwo' Thekin will go to Mandalay in a few days. The *Sit-boh-gyee* is at Mandalay; the ladies are alone in their house.'

He paused, and glanced at his companion to see how his remarks were affecting her. She sat with her lips pressed together, wrapped in thought: there was that in her expression which made Moun Louk continue with the same apparent carelessness: 'Tharnwo' Thekin lived with them for many weeks, but now he has his own house. I believe there is no Englishman near the ladies at night.'

'Where is their house?' asked Mah Mee.

Moun Louk dropped his careless manner, and explained carefully where Colonel Grane's bungalow stood. 'After passing the jail,' he said, 'you go up the road across the railway, and'—

'I know it,' snapped Mah Mee, springing to her feet. 'I saw my lord ride in there this morning with an English girl.'

'A girl with yellow hair?' inquired Moun Louk.

'Yellow hair,' assented Mah Mee.

'That is the girl: that is the *Sit-boh-gyee's* daughter.' He rose from the mat on which he had been sitting, and cast his eyes round the walls of the house until they rested on a naked *dah* which glittered like a steel ribbon against the brown boards. He glanced at Mah Mee. 'It is very sharp,' he said; and walked out.

Mah Mee stepped swiftly over to the corner, where the wicked-looking sword-knife hung, and ran her finger along its edge; then she took it down and balanced it in her hand. 'It will do,' she whispered as she replaced it on the nail.

Mah Mee did not return to her friend of the steamer until very late that night, and when questioned, replied that she had been with old friends at the other end of the town. Colonel Grane's Madras servants could have told another story.

On the following evening at sundown she went back to Moun Louk's house, and finding no one there, walked in, and made herself at home with that gentleman's cheroots and betel nuts. She had learned all she wanted to know about the interior arrangements of Colonel Grane's bungalow: the 'cook's matey,' a young Madras man, who spoke Burmese, had been attracted by her pretty face, and gave her all the information she asked for. Burmese girls are always of an

inquisitive turn of mind, and Venketsawmy, knowing it, had answered Mah Mee's casual questions without suspicion. She had not asked many; among others, which was Miss Grane's sleeping apartment, and whether the sentries at night were Burmans or natives of India. Mah Mee had well-founded confidence in her fellow-countrymen's talent for sleeping most soundly when they ought to be awake; but the ways of those big black men were strange to her. Had she known the Punjaubi nature, she would not have taken the trouble to clear up this trifling matter.

She sat smoking patiently until she thought it time to set out: then she lighted a fresh cheroot, hung the *dah* by its loop over her shoulder, and went into the street. There were few people about when once she got clear of the slums, and no one interfered with her; her short *tamein* and bare shoulders stamped her as a 'jungle-woman'; and the police, lounging under the dim street-lamps, saw in her a timid country-girl ostentatiously displaying a weapon for self-defence. Any attempt to conceal it would have led to her prompt arrest. When she came opposite Colonel Grane's bungalow, she paused; one oil-lamp in the up-stairs veranda showed that the house was not in its normal condition; yesterday, it had been all neatness and order; now it was blocked with heaps of furniture. All the rooms up-stairs were in darkness save one; but that one, as she marked with a thrill of savage delight, was the corner apartment the servant had pointed out as Miss Grane's.

Down-stairs, the central room was brightly illuminated, and the swinging punkah told there was some one within; but the *purdah* across each doorway screened the interior, and Mah Mee could not discover who was there. Strolling up and down on the path before the house were the two Burman sentries; they stopped now and again to talk in low tones, and once the girl heard them yawn noisily. Waiting until their backs were turned, she stole through a gap in the thick-set bamboo hedge which surrounded the compound, and crept over to a clump of laurel-like crotons, under whose shadow she could sit secure from observation. Squatting down upon her heels she looked out through a framework of leaves and reconnoitred at leisure. Her hiding-place was opposite the corner of the bungalow and about thirty yards from it. She could see nothing of the front veranda save the nearest corner; but right overhead were the open windows of Miss Grane's room, veiled with white muslin curtains. No one could enter it unseen, and Mah Mee was content. She laid the *dah* on the grass, adopted a more comfortable attitude, and composed herself to wait.

She did not know how long it might be before Miss Grane retired, so she undid the knot in the corner of her kerchief and took out a 'betel-chew' she had prepared at Moung Louk's; and while mumbling this, amused herself catching the bright fireflies which hovered in swarms about the bushes. The night was warm and very dark; but Mah Mee, albeit she had slept little these last two nights, had no desire to close her eyes. She was perfectly calm; her now idle hands lay loosely folded in her lap without a twitch of nervousness, and her breath came and went without a tremor.

As the gong up at the native lines rang out ten o'clock, and a hundred hoarse voices answered in Hindustani, 'All's well!' the rustle of a woman's dress on the stairs made Mah Mee prick up her ears. She listened carefully, for she could see nothing. The footsteps went up the stairs and across the uncarpeted veranda above. Another lamp blazed up in the space over the porch; and with a suppressed exclamation of disappointment Mah Mee grasped the fact that Miss Grane was not yet coming to her room. She drew from the hole in the lobe of her ear a partly-smoked green cheroot and smelt at it longingly; she had matches in her kerchief, and felt for them; but as her fingers closed on the box, she reflected that it would attract attention if she struck one. She pinched the cheroot and replaced it in her ear with a little sigh; she could not smoke now; she would wait till—till afterwards.

Eleven o'clock boomed from the distant gong. Mah Mee was growing stiff, and the Burmese sentries were evidently beginning to wonder when their charge was going to retire, for from time to time they walked out on to the grass to see what she was doing. At length a movement in the veranda made the watcher start: through the muslin curtains she saw a lady enter Miss Grane's room and turn up the lamp. She picked up her *dah* and fingered its edge delicately; a few minutes more and then— She set her teeth and glared with eyes that started from their sockets up at the shadowy figure in the bedroom; for a moment she had lost her self-control.

She had ample time to recover herself before the light was extinguished, however. She thought Miss Grane would never go to rest, so long did the lamp burn in her room. But suddenly it went out with a snap, and silence followed. She must wait till the sentries were asleep, and to their proceedings she turned her attention. They lost no time once Miss Grane was safely bestowed. Mah Mee saw them unroll their sleeping-mats and lie down under the stairs, after turning up their bull's-eye lanterns and placing them so that the light shone over the compound.

'I will wait,' thought the girl, 'till the gong strikes the second watch. I must not hasten.'

Midnight rang out. Mah Mee waited until the last echoes died away, and then, *dah* in hand, stole noiselessly as a shadow across the lawn to the corner of the house, where she paused to listen. The heavy snoring from below the stairs told her all was safe; and she glided forward, across the floor and up the stairs. Arrived at the top, she paused again to look round: the veranda was piled with tables and chairs; every door was open, and a cold damp air floated through the house. Feeling her way now with redoubled care, Mah Mee moved along the floor till she stood on the very threshold of Miss Grane's room, with only a loose-hung curtain between her and her victim. She held her breath and listened: the only sound within was the even regular breathing of one asleep. Mah Mee drew herself upright and smiled; the moment had come.

She took a firmer grip of her *dah*; the rings clattered sharply on the pole as she tore the *purdah* back and sprang through the doorway.

Her arm was raised ; another step and she might strike. A terrified cry broke from the sleeper, and a blinding flash burst almost in Mah Mee's face. The *dah* slipped from her relaxing fingers ; the report of the pistol was ringing faintly in her ears as she fell clutching at the sharp, stinging pain in her breast. She had been too hasty after all.

The story was all over Rangoon before next morning's sun was two hours old. Mrs Grane, having taken advantage of the absence of her husband and daughter to organise a thorough house-cleaning, had occupied Mabel's bedroom for a night, her own being damp. A female dacoit (such persons are not unknown) had gone into a room she thought empty, to see what she could pick up, and finding herself confronted by Mrs Grane, had attacked her with a *dah*, meeting her fate at that courageous lady's hand. This was the account which circulated without contradiction, for neither the Granes nor the Farnwoods, who were the only people aware of the truth, cared to make it known.

THE FOLKLORE OF THE ISLE OF WIGHT.

IN spite of its romantic beauty, and past history of Danish and French invasions gallantly repelled by its hardy people, the Garden Isle is the home of but few poetic legends. A more imaginative race would have made the grassy barrows of the ancient Jutes, which outline many a windy hill, the centres of weird tales, and would have surrounded the great Chessil cemetery with its buried treasure of warriors' weapons, children's toys, and the jewels and household implements of women, with the glamour of mystery. But the matter-of-fact islanders take no interest in the dead past. Unlike the Cornishmen, who delight in tales of 'the old men' whose rude monuments surround them, they take no heed of the remains of their Saxon forefathers, although the most purely Saxon words, unheard elsewhere, linger on their lips.

The most diligent inquiry fails to find here any trace of the fairy folklore with which Ireland and Scotland still abound. Some thirty years ago it was not extinct, for a writer in the *Quarterly Review* gave us some interesting accounts of the belief then current in a more benevolent and genial race of fairies than the malicious and variable 'wee folk' of the Celtic races. The generation of islanders who believed in them has passed away (though a 'fairies' hall' was shown quite recently among the fern-hung roots of old thorns in a high bank by Arreton Down). The sound of their 'music, of most unchanting sweetness,' is no longer heard among the ruins of Quarr Abbey, where the fabled golden coffin turned out to be a stone coffin filled full of golden hair, and where in the old days so many royal ladies and noble warriors were laid to their rest by the narrow Solent sea.

At birth and at burial, old wives' fables still crop up ; and a bride must look well to her doings if she would escape the bad luck which many an old saw warns her of. To make any of the

clothes she wears on her wedding day is disastrous ; to wear a blue gown will ensure the loss of her first child, who will be buried in a blue coffin ; to look back on leaving the door will surely bring her bad luck ; and if her husband be dressed all in black at the altar, he will assuredly take his bride to the *litten* (or churchyard) before six months have passed. Strong as is everywhere the prejudice against a Friday's marriage, the islanders regard a Saturday wedding as even worse. 'You may,' they say, 'be unfortunate in everything in life if you marry on a Friday, but you will have love to comfort you.' Saturday is 'no day at all ;' you will neither have love nor life, nor money nor luck, 'nor nothink at all.'

For a single girl to go to church three times with a wedding party is so unadvisable that it is not an uncommon thing to see a pretty young girl sitting solitary outside a village church, afraid to enter while the service goes on within ; for some courage is required to face the forebodings of the proverb, 'Three times a bridesmaid, never a bride.'

Although a blue gown must be avoided by the bride who would fain see good days, yet a small and invisible scrap of the dangerous colour must be worn somewhere, generally in the garter, for the old saying ordains that she must appear in

Something old and something new,
Something borrowed and something blue.

And while the general prejudice against the marriage of two sisters on the same day is here unknown, it is considered very unlucky for a girl to marry a man whose name begins with the same letter as her own ; for

If you change the name and not the letter,
You change for the worse and not for the better ;

and to the truth of this old saying innumerable islanders are ready to bear witness.

A new-born baby must be first fed by its mother out of a silver spoon, as a preventive of poverty. If the child's own wealth be not secured by this effort, a rich marriage at any rate may be counted upon. It must be carried upstairs before it goes down ; and the old nurses will mount a chair with the child in their arms if there are no stairs to go up, lest he should in life pursue a downward course. The nails must not be cut for a twelvemonth, or the baby may turn out a thief ; or if not, 'you cut him away from you.' To short-coat a child in the unlucky month of May is forbidden by the old saying :

Tuck them in May,
And you tuck them away.

A child who never sneezes is under a spell, and one who does so often 'has no lack of brains in the head.' He must not see himself in the glass, lest he cut his teeth 'on the cross ;' and when an older child loses his first teeth, care is taken to make him throw them in the fire, or else the new ones will be shaped like a dog's.

In the same way, it is very unlucky to burn hair, and equally unlucky to leave it about where a bird might get it to build its nest with. Bad headaches would result, so the islanders throw it in the ashes ; whilst the Ulster peasants hide it in the thatch.

To cut the nails at night is unlucky, but not so bad as to cut them on Sunday, for

He who on Sunday pares his horn
'Twere better for him he had ne'er been born.

It is believed that if a child be born with any teeth, he will certainly turn out a bad and undutiful son; and a baby born at midnight or any time between that and one o'clock has the power of seeing any spiritual creatures that haunt the earth. A child whose teeth are divided in front will be lucky and a great traveller; met brows mean bad temper; filbert nails foretell wealth; and flat or fish-scale nails show that you must work hard for your living. Freckles over the eyes mean a death by drowning; and a high brow tells of a good temper.

From all manner of features the disposition can be read like a book by those who know the science. By pulling out a long hair from the head and stretching it tightly for a moment, you can divine if a girl's temper be proud or not. If it curls up on being released, she is of a haughty spirit; and if, when you press the back of the hand, a white dint lasts for any time, you may know that she has a sullen and unforgiving nature.

An odd cure for toothache is to put the same stocking always on the same foot, and to remember always to put on the left stocking first. Indeed, it is always a good way of ensuring luck to put the left glove or stocking on before the right, and the most trivial duties of the day may be so performed that good or ill luck may follow the doing of them. For two women to 'handle the teapot' during the same meal is unlucky; for the loaf to break in halves bodes no good to the household; and for the knife and fork to lie 'crossed' on the plate is as sure a sign of quarrelling now as it was in the days of Addison. A falling knife tells that a strange man is coming; and a fork foretells a woman's visit.

Sweeping the room after seven in the morning is unlucky, and if the sweeper is so careless as to lay the broom with its head up against the wall, it is sure to bring an undesired visitor; and we find the same belief in Rutlandshire, where flourish some very remarkable and far-descended scraps of folklore.

All the widespread moon-beliefs are found in the island; and it is a common thing for a whole household to be warned against looking out of any west window as the new moon is visible. The members of it will then hasten out of doors, and there curtsy nine times, kiss the hand nine times, and turn the money in the pocket thrice, taking care not to let it leave the pocket. By this means you are certain of having some in your pocket all the month.

Another odd way of ensuring money in your purse is to carry there the tip of an ox-tongue. 'It breeds money,' say the old folks, who are never without it. And yet another way is to have a small bunch of wheat ears, corn, or barley hanging in every room of your house. 'It keeps away the poverty,' say the poor widows who stoop to gather any stray ears they see.

To pass anything that you might pick up is against your luck, for

If you bend your back to pick up a pin,
You'll bend your back to pick up a bigger thing.

And even in the picking up of a pin there are rules to be observed by those who are careful in such matters. You must never pick it up by the point, even if you have to go round to get the head; and if any one asks you for a pin, never hand it with the point from you. It is safer, however, not to hand it at all, but to stick it into your own sleeve, and let the person who wants it take it thence.

Nails, too, must be picked up and carried home for luck; and if you see a piebald horse, and wish, you must be careful only to look at the tail, for you lose your wish if you see the whole horse. There are no wells, or trees, or arches, such as we find in Ulster and Cornwall, where wishes are formally made. But one belief found in both these places, and in Lancashire and Norfolk, prevails here. To bring hawthorn into a house when it is in bloom is to bring death into that house. Blackthorn is regarded with the same aversion; and a lady whose drawing-room was beautified by the white blossoming sprays last spring was urged by her terrified servants to throw them away instantly, or she would have cause to rue the day she brought 'the flower that smelt of death' into her house.

To let birds' eggs hang under your roof will bring misfortune also; they may be hung in a shed or under the porch and no harm will come to the family; but when they are inside the door, ill-luck is in there with them.

If you kill a cricket, not only will you be unlucky, but the survivors will avenge its death by eating your stockings—a queer belief, which is found also in Ireland.

If you burn crusts—as the islanders call crusts—black beetles and poverty will haunt your household; and if you let so much as one green leaf burn in the fire, a sharp pain will strike through your own body. Never transplant parsley; never buy or sell bees; never return to the house after setting out, if you have forgotten something, unless you sit down before leaving it again; never put shoes or boots on a table, or there will be a disturbance in the house; never turn back on the stairs; and above all, never, if you value your luck, pass any one on the stairs, however great your haste may be.

But there are evils you cannot guard against in the island, however wary you may be. To go on with a journey after you have seen a magpie fly across your road is a hopeless thing; and many an islander has turned back, well knowing that misfortune would be his portion if he went on. If the magpie flies in the other direction, it does not affect the luck; but a horse-dealer who had recently crossed the water to Southampton on business, told the writer that the first thing he saw was a magpie; and the second, a squint-eyed woman, and that he would sooner have given five pounds than have met them, for he had no luck in his dealing, and wished with all his heart he had taken the warnings in time and turned back.

Crows and hawks may fly over the house to bring warning of death; a glass may ring; 'Come in' may be said carelessly when no one knocks, and so ill-luck may enter. A cat may go up-stairs, or a spider may be killed accidentally; the potted plants in your house may bloom out of season, or the fruit-trees bear fruit and blossom at the same

time; the death-tick may sound in your ears; salt may be burnt in the fire; or your scissors fall with the points up—and if any of these things befall you, then prepare for sorrow; for sorrow will surely come to your house or to those you love.

But every omen is not a sinister one. If a bee flies into your house and stays there, you may prepare for the stranger who is sure to follow soon. If you meet a flock of sheep, you are sure of a present; and if you take an orphan into your house, 'fortune will smile upon it like summer rain.' Good-luck attends also the accidental turning of a garment, and laying a rug down on the wrong side; and there are well-ordered island homes where such mishaps are left unremedied all day, lest the luck should be lost.

If a spider of any sort touches you, you are lucky all day; and the baby-spiders or money-spiders that cling to your clothes must not be shaken off, for they tell of fortune; and old women give this rule to young housewives beginning life in an old jingle, thus:

If in a house you live and wish to thrive,
Be sure to let your spiders run alive.

And they warn them to spare the spinner while they destroy the web.

A girl who wants to know what her future husband's calling will be must take the first egg a young hen lays, break it raw into a glass of water, and let it stand in the sun all day, when it forms the shape of something from which you may guess what trade your sweetheart will follow. This mysterious-looking object may often be seen standing on a kitchen or cottage window, while wondering young women discern ships, or ploughs, or spades in the form it takes. They look, too, for their lovers' initials on bracken roots, and on the roots of lilies gathered on St John's eve.

Here are a few of the superstitions about death and of the ghost tales of the island. The sound of a dog barking thrice, the sudden restlessness and loud 'blaring' of the cows, the flowering of laurestinus beside a grave, the loss of your bees from their hive or the crickets from your hearth—all these are sure forerunners of a death in your household. A great show of plums on the trees foretells death by fever; and blue-bottles hanging about the house bring the same doleful message. Your bees will fall asleep, and must be wakened and told of the death, or they all die; and they must be told carefully and distinctly after three taps on the hive.

It is considered unlucky to change the patient's linen before death, and it is universally believed that people can only die easy when on the left side. The strange belief we find in Ireland and in Lancashire still lives here—that the soul cannot entirely forsake the body till the coffin is carried from the house. Therefore, the doors and windows are never entirely closed during the period between death and burial. A light burns in the room by night, so that the 'angel of the dead' may look upon the body it inhabited. It is supposed to come and go, and never to be far from the chamber of death. If the door by chance be closed, and it is seen to open gently of itself, it is the spirit of the dead entering the room; and the angels of heaven never carry it

away to heaven till the door has closed on the coffin-bearers.

No pin should be left in the shroud or tying of the dead, 'lest what's bound on earth be bound in heaven;' and no flowers should be buried in the coffin. The friends watch anxiously here, as they do in Ireland, Scotland, Lancashire, and Norfolk, to see if the dead body becomes stiff or remains limber. If it fails to stiffen, it is 'waiting for another;' and a death will take place before another year be out; and if the eyes do not close, they are 'watching' for the soon-coming death they foretell.

If in an island village a dead body remains unburied over the Sunday, two more villagers will die within three months; and if you chance to meet a coffin with the wide end toward you, you may be sure that you will bury 'one of your own' within a twelvemonth.

Turning from these grim forebodings, we must glance briefly at the ghostly legends which cling to some of the old island houses. In many of them we hear of portraits that leave their frames by night and ramble up and down the old haunts they loved. In one island vicarage the figure of an old clergyman glides down the stairs every night as the clock strikes twelve, his silk gown rustling as he walks. One long-demolished mansion is still haunted by its lord, who committed suicide. Living people declare that where were once the stately terraces of the antique garden of Knighton, they have seen his mournful ghost drag his weary steps. In the ancient panelled house where King Charles for the last time met a deputation from Parliament, his restless ghost has often been said to terrify those who met the kingly figure and saw the melancholy eyes of the monarch, whose sad story gives such pathos to the ruined rooms at Carisbrooke Castle where he was imprisoned.

ABOUT AUTOBIOGRAPHIES.

As a rule it may be said that a library composed entirely of books belonging to one class of literature is attractive only to the specialist student. The classical library appeals to the scholar, the theological library to the cleric, the legal library to the lawyer, and the medical library to the physician; and though in every one of them the cultivated reader would certainly find something to suit him, he would soon be depressed by the terrible lack of variety. As for the libraries of the people who call themselves 'book-lovers,' probably in order that they may be distinguished from the tribe of book-readers—the collectors who gather together first editions, large-paper copies, Elzevirs, black-letter folios, Caxtons, and all the miscellaneous 'curios' and rarities of the world of books—their value in their owners' eyes is intensified by the fact that the common herd is unable to discern in them any value at all, and can only 'wonder with a foolish face' of bewilderment when told that a small shelf of musty-looking tomes, which might have come out of the sixpenny box at a bookstall, is worth as much as the house that shelters it. Still, there is no reason why, if a man will only set his wits to work, he should not be able to gratify the instinct of the specialist collector in forming a library

which would be of some interest to the intelligent Philistine, as well as to the member of his own little tribe of connoisseurs. He might, for example, begin the formation of a collection of Autobiographies, for not only is autobiographical literature sufficiently extensive to provide him with occupation for a lifetime, but it comprises works which are sufficiently rare to stimulate the appetite of the book-hunter; and as the collection grew he might make the startling discovery that he had become possessed of books that tempted him not only to look at them, to handle them, and proudly to exhibit them, but actually to read them as well.

Indeed, a man of ordinary intelligence who did not feel the fascination of a chamber lined from floor to ceiling with the stories of the lives of men and women, told by the only persons who could tell them with absolute truthfulness, must be in some way an abnormal creature. To the average human being human nature is the one supremely interesting thing—witness the universality of the passion for fiction, drama, and personal gossip; and the autobiography is of human nature all compact. 'I have remarked,' says Carlyle, in the opening chapter of his *Life of John Sterling*, 'that a true delineation of the smallest man, and his scene of pilgrimage through life, is capable of interesting the greatest man; that all men are to an unspeakable degree brothers, each man's life a strange emblem of every man's; and that Human Portraits, faithfully drawn, are of all pictures the welcomest on human walls.'

If this be true of biography, which is, after all, a view of the house of life from the outside, with here and there perhaps some details supplied by surreptitious peeps through window or keyhole, it must be more inclusively true of autobiography, in which we are taken by the hand and made free of the inner chambers. An absolutely unreserved and sincere record of the deeds, words, thoughts, and emotions which have gone to make up the most commonplace life, would be of priceless value in many ways, but most of all, perhaps, would it be valuable in relieving every one who read it of at least a part of that burden of isolation which most people carry with them all their lives. Nearly everybody, certainly every young person, is fully convinced that some of his experiences are peculiar to himself; and because of this conviction he dare not disclose them, lest he should subject himself to certain misunderstanding and probable reprobation. Then, in some fortunate moment he takes up the ideal autobiography, the volume in which some other man has disclosed the secrets of his soul, and he finds that what he has supposed to be his own peculiar property or his own peculiar torment, is the property or the torment of this other man as well; and if of him, why not of a hundred, of a thousand men—of the greater number of the race? Loneliness must always be more or less terrible to a being with a social nature that craves for companionship; and a book which relieves our loneliness by assuring us that what we had mistaken as a sign of alienation from our fellows is really a sign of kinship with them, is a book which enriches our life by giving us a new feeling of being at home in the world.

Once, and once only, during the course of

Emerson's last visit to England he and George Eliot met in London at the house of a common friend. Unfortunately, no Boswell or Eckermann was near, and of what could not fail to be an intensely interesting conversation, only one fragment has been preserved. The sage of Concord asked the great English novelist what was her favourite book—not, one would think, a question to which an omnivorous reader like George Eliot would find it easy to give an instantaneous reply. Nevertheless, the reply was ready: without a moment's hesitation she named a work by Rousseau; and Emerson's serene face brightened as he said, 'Why, that is my favourite too!' It seems at first sight one of the most curious and inexplicable of coincidences that out of the whole world of books with which both interlocutors were so widely familiar, each should have selected this book as the object of special and peculiar favour. But there is not really anything curious or inexplicable about it: the interchange of identical sentiments was simply a putting into concrete form of the general feeling that no knowledge can possibly be more interesting or fascinating than the knowledge of those inner facts of human nature from which the veil is so seldom lifted.

Probably, indeed, no one, or hardly any one, doubts that an absolutely sincere and unreserved autobiography would be a uniquely attractive and valuable book; but many people may doubt whether even an approximation to such sincerity and unreserve has ever been made. Even a biographer, it may be said, is apt to fall in love with his subject, and his hero-worship will tempt him to heighten all the lights and soften all the shadows in the hero's portrait; but his temptation is nothing to that of the autobiographer, for the good reputation of *his* hero is of more consequence to him than is that of any other man in the world; and to expect him voluntarily to reveal that which would expose him to execration or contempt is simply to expect a moral impossibility.

But if anything like a minute revelation of a man's life through a biographical medium be neither generally attainable nor even desirable, it does not follow that the impression left by a man's self-painted portrait, the record of his life from his own point of view, must necessarily leave an unveracious impression behind it. What David said in his haste no man who is not an inveterate cynic will repeat at his leisure. The man who sits down to write his own biography is not likely to be less truthful than his neighbours; and he is probably incited to his task by the reflection that an accurate record of his career, written by the one man to whom absolute accuracy is possible, will redound to his honour. The parenthetical clause in the last sentence is important. Whether a man *will* tell the whole truth about himself may be questionable; but it is unquestionable that he is the only person who knows it and *can* tell it. Many a word or action which, as recorded by the best-informed biographer—who necessarily writes from the outside—seems perfectly inexplicable, would in the pages of an autobiography lose its mystery by revealing itself in its relation to some obscure side of the writer's character; and even if his explanation

were not in itself satisfactory, it could not fail to supply invaluable materials for an explanation of our own. We may even suspect that it is not the true explanation; but the mere fact that the autobiographer wishes us to accept it as true is a real help to an understanding of his character and motives.

As a matter of fact, the secrets of personality cannot be kept, and a man's nature betrays itself without his knowledge of the betrayal. The truth is suggested by words from which truth is absent; the writer, though consciously false, reveals himself unconsciously; and if we lose the real man at one point we catch him at another. Perhaps we are more likely to catch him in autobiography than in any other form of written utterance. There is occasionally something intoxicating in the act of writing about one's self. There is no surer means of knowing a man than getting him to talk about something in which he is supremely interested, and the autobiographer has a theme which is absorbing enough to carry him out of himself, and make him forget all his favourite tricks and affectations and reserves.

Oddly enough, there seems to be some self-revealing magic in the mere use of the first personal pronoun, even by a writer who does not intend to make any confession. The novelist who adopts the autobiographical form often seems to be so dominated by the form that he unconsciously produces a story which is autobiographical in substance also. Charlotte Brontë and Charles Dickens each wrote one novel in which the principal character—the heroine in one case, the hero in another—is also the narrator; and *Jane Eyre* and *David Copperfield* are the most intensely and recognisably *personal* books which their authors have left behind them. Dickens was doubtless well aware what he was about, for a man cannot tell the story of his youth without being conscious of the fact; but *Jane Eyre* proves conclusively that a woman can paint her own portrait and never recognise a likeness obvious to all the world. In answer to a statement that in her famous heroine she had represented herself, Charlotte Brontë declared that Jane was like her 'only in being little and plain.' That she believed what she said is certain; and it is equally certain that she never made a more egregious mistake. The pictures of Charlotte Brontë painted by Mrs Gaskell and Mr Augustine Birrell are so good that by their help we are enabled to see that the picture of Rochester's governess has more of intimate and interpretative *vraisemblance* than any one of them. Shirley was 'she,' Lucy Snowe was 'she,' but Jane Eyre was 'I,' and the pronoun had such potency that, all unwittingly to herself, the features of the real I were traced one by one on the tiny scraps of paper.

There are probably some very sensible people by whom this last speculation will be scouted as fanciful. Let it be so: perhaps that is the beauty of it. If we could never be fanciful, life would not be worth living; but whatever amount of fancy there may be in this or that speculation about autobiography, the charm of autobiography itself is a solid and a delightful fact. The hypothetical collection pleaded for on an earlier page would be a treasure-house of humour and pathos,

of adventure and meditation, of jubilant boast and penitent confession, of splendid, strange, or grotesque curiosities of life from the well-trodden highways and the obscure byways of human experience. It has been said that the best books are the books which take us into the best company; but then men's opinions concerning good company are perplexingly mixed. One thing, however, may be said with more of emphatic dogmatism than is generally allowable, that if a man cannot find pleasure in the companionship of a devout saint like Augustine, or a vivacious scamp like Cellini; a sentimentalist like Rousseau, or a matter-of-fact man like Cobbett; a pushing bookseller like Lackington, or a gentle book-writer like Leigh Hunt; a dreaming De Quincey, or a wide-awake Franklin; a philosophical aristocrat like Lord Herbert of Cherbury, or a pleasantly egotistic shepherd like James Hogg—if, having a taste for theology, he has no delight in John Bunyan, George Fox, Francis William Newman, or his more illustrious brother, or, being a lover of feminine society, is blind to the varied attractions of Madame D'Arblay, Harriet Martineau, or Mary Howitt—he may be given up at once as a hopelessly unsocial person, fit only for an uninhabited circle—though, unfortunately, there is none—in Dante's Inferno.

NEST-BUILDING IN CAPTIVITY.

MANY of us, some time in our lives, have taken an old bird's nest in our hands and admired the wonderful structure, the neatness and care with which the inside has been finished, whether it be the nest of a thrush, so carefully lined with manure, and smoothed off with the art of a well-taught modeller; or maybe the lovely lining which we find in a robin's nest or some of the finches; but we have few actual chances of seeing these miniature homes put together, unless they are built in captivity, under which circumstances the art of nest-building becomes most interesting to a careful watcher.

Let us take, for instance, canaries. A pair of these birds in their second season's building—by which time they have perfected thoroughly the art, supposing they are supplied with a suitable box and materials for the purpose—commence first of all by filling the box with the rougher pieces of moss, after which the hen hops into the middle of it, and sitting down, begins to turn round and round; by this process the inside of the nest is formed. If they find it not full enough, more moss is brought, and the process repeated until it is to the satisfaction of the hen. After this, the delicate part of lining the nest is commenced, the hen sitting in the nest while the cock supplies her with hair, which he first prepares in the following manner. After picking up a small bunch of hair which he holds across the middle, he flies upon the perch and knocks it from side to side against the perch, to shake all loose pieces out; after which he holds the wisp or bunch of hair on the perch with his foot, at the same time drawing his beak up it with a twisting motion. This is repeated until it becomes somewhat woven together, and is then presented to the hen, which she carefully takes and places in the

moss, one piece after another, until a smooth lining is the result. At this point she allows her husband to enter the nest, which they keep doing in turns, with a great deal of excitement and soft twittering, continually turning round and round to finish it off in a workman-like manner.

Canaries, when both are young, often make some very radical mistakes with their first nest, either by using far too much material or not enough. One pair we watched filled the box completely full; so they were supplied with more material, which they at once began piling up on the top of the box until it rose two and a half inches above the edge. In the middle of this they made the nest, not only using moss and hair, but every feather and odd bit they could find. At the end of the season they built a second nest, which showed they had learned something by former experience, this nest being composed of sufficient material and no more, answering the purpose in every way, with about half the expenditure of labour used in their first attempt. Again, it is very interesting to watch them under the condition of having unsuitable materials to build with, and under these conditions they point a moral to us by doing their best under the worst circumstances. To one pair of birds which had bred three seasons I gave a nesting-box so small that the hen could not possibly sit in it; however, this only called forth special effort and thought; and after filling the box, they gradually extended the sides of the nest, a little at a time, as it rose above the edge of the box, until the circumference was large enough to allow of the inside being formed.

One pair which were caged together last year could never agree as to which box they should build in, having a choice of two. The hen decided on one, the cock on the other, so they both began building on their own account until all the material was used. Then the worst of the quarrel began. While the hen was down feeding, the cock would go and fetch the moss out of her box to put in his own; and so *vice versa*, many desperate fights being the result. After three days of this unhappy state of married life, I removed one box, and gave them some fresh moss; after which they built a very nice nest, and reared a family of three, in perfect love and concord with each other.

It has always been my habit with the young birds, when old enough to leave their mother, to take them from the cage and turn them loose in the aviary, much amusement being obtained by watching them in their games, for, like children, they not only play games in their way, but play at keeping house, which I saw them do as follows. Two young birds took possession of an empty box; and after a deal of twittering and hopping in and out, they began flying down and picking up feathers or any bits they could find and taking them into the box. After this had been going on for about ten minutes, another young one without being asked came and joined in the game, but was rudely buffeted away; and, no doubt in a little petty spite, he kept going every time the other two fled down, and threw out all they had put in, which ended in them flying him round and round the aviary until they were all quite exhausted.

I have an old cock canary that has never been blessed with children, yet, for the sake of his splendid disposition, is kept loose in the aviary, and spends the entire summer in philanthropic work; that is, he makes it his duty to look after the young ones as they are turned loose in the aviary, feeds them as their own mother would, and has often stopped them quarrelling, by giving them a sharp blow or two with his wings. Often have we seen him on the floor with five or six young ones round him, all clamouring to be fed. Nothing daunted, at it he goes, dropping food first down one throat and then another, trying his best to satisfy all. Many a weakly one, not learning quickly to feed himself, would have succumbed had it not been for his fatherly care; and when the autumn comes and the young ones have grown out of hand, he seems quite mopish, his occupation being gone.

Canaries, like human beings, vary very much in character, some cocks being so indifferent and idle that they will let the hen do all the work of building and rearing, while they themselves sit and plume their feathers. Others, again, are perfect gentlemen in their manners, waiting on the hen with a quiet courtesy, and seeing that all she requires is at once brought to her. Again, the hens vary in disposition, some hens behaving in a quiet modest way, attending to their young ones with regularity; while others are in a constant state of chatter with their husbands, pecking and arguing with them every time they go near. Thus we see that these little birds have their tiffs and domestic quarrels, not unlike ourselves.

ON THE WINGS OF THE WIND.

DEAR idle summer winds that softly blow

Across the lea,

I love a maid, and fain would have her know

Sweet thoughts of me.

So let me fetter you with strong desire

For my behest,

Then wing your way, and light a loving fire

Within her breast.

Go, murmur through the pine-trees, soft and low,

In mournful tone,

Until she sighs—then whisper: 'Thus in woe

He walks alone.'

Go, dash her lattice with the sea's salt tears,

Nor ever rest

Until she weeps—then whisper: 'So do fears

Assail his breast.'

Go, shake the heather blooms, and make them ring

Each rosy bell

Until she laughs—then whisper: 'They but sing,

"He loves thee well."

Go, waft the sound, if marriage church-bell rings

A glad refrain,

Then—if she speaks—oh, bear it on your wings

To me again!

SOME LONDON PARKS.

FEW spots are dearer to the heart of the Londoner than his Parks, which have been fitly called the 'lungs' of the great metropolis. Like most human institutions, they have had their vicissitudes, at one time basking in the sunshine of popular favour, at another finding themselves relegated to the chill shades of neglect. But ever since the Restoration, one or other of the Parks has been the resort of Londoners of all classes. The history of the Parks may be truly said to be the history of the amusements and the fashions of our ancestors for several centuries.

Hyde Park owes its origin to Henry VIII., who, at the dissolution of the monasteries, wishing, no doubt, to extend 'his hunting-grounds, obtained the manor of Hyde from the Abbot of Westminster and the monks, who for many centuries had remained in undisturbed possession of its silvan glades. The first keeper was one George Roper, appointed by Edward VI., at a salary of sixpence a day, and many perquisites, no doubt. With these royal chases, however, we are not much concerned. Elizabeth reviewed her 'Pensioners' there, all 'well appointed in armour on horseback, and arrayed in green cloth and white'—the first of a long succession of reviews in Hyde Park. Charles I. opened it as a public pleasure-ground. Races and other amusements took place there; and Shirley the dramatist tells us how the cuckoo and nightingale sang there, and milkmaids plied a busy trade. In the troublous times of the civil wars the Park witnessed Fairfax and his army marching through it three deep, each man with a laurel branch in his hat, on their way to the city. The next year, Colonel Lambert encamped there; and in 1649 Cromwell reviewed his Ironsides in the same place.

In 1652 the House of Commons resolved to sell the Park for ready-money in three lots, which was accordingly done. Evelyn, in his Diary for April 1653, tells us how he 'went to take the aire in Hide Park, where every

coach was made to pay a shilling, and horse sixpence, by the sordid fellow who had purchas'd it of the State, as they were called.' The merriment of Hyde Park was not totally eclipsed during the Commonwealth. May-day 1654, as we learn from a letter of that time, must have been cheerful, as many as fifteen hundred coaches being there with their contingents of fair women and brave men, and when 'my Lord Protector's coach came into the Parke with Col: Ingoldsby and my Lord's daughters (three of them all in greene-a), the coaches and horses flocked about them like some miracle.' On that day—the Park belonging to a private owner—each coach had to pay 2s. 6d. We also hear that this same day was more observed by people going a-maying than for divers years past—'many hundreds of coaches and gallants in attire, but most shameful powder'd hair men and painted and spotted women.' In spite of the Puritans, however, this fashionable throng seems to have enjoyed the hurling-match between Cornish gentlemen, fifty a side, which took place on that occasion.

At the Restoration, Hyde Park became the most fashionable rendezvous of the town. The 'Ring' or 'Tour' was then the centre of attraction, and round this open space, surrounded by trees, the riders and drivers circled. Samuel Pepys often mentions the Park—which seems to have had a great attraction for him—and minutely tells us of his smart suit of clothes obtained for a ride there, and how nervous he felt in them; or, again, how ashamed he felt of being seen in a hackney coach, and of his great joy in driving a carriage all his own! The world of his day dined in the afternoon, and then went to the play, afterwards taking a drive in the Park, and finally returning home to supper. 'Every one, therefore,' says De Grammont, 'who had either sparkling eyes or a splendid equipage constantly repaired thither; and the king seemed pleased with the place.' On the 25th of April 1669, Pepys tells us he took his wife to the Lodge, 'and there in our coach eat a cheese-cake and drank a tankard of milk.'

We now enter on the era of reviews in the Park. In these, the early days of a standing army, Charles reviewed his Guards in honour of the ambassadors of the Sultan of Morocco in 1682. William III. held many reviews there, and from that time until this the practice has continued. In 1695, hackney carriages were no longer permitted in the Park, a regulation which still holds good. Hyde Park was never more fashionable than in the reign of Queen Anne, when large chariots appeared upon the scene drawn by half-a-dozen Flemish horses. Now the long period of duels begins. In 1712 a duel was fought in the Park between the Duke of Hamilton and Lord Mohun, in which both lost their lives. During the Jacobite commotion in 1715, a camp was formed there. Among the disadvantages of the Park at this time were the badness of the roads through it, its dust, its inefficient lighting at night, and the frequent robberies which, as a necessary consequence, ensued. Even as late as 1749, Horace Walpole, returning across the Park from Holland House, had his carriage stopped by two highwaymen. Queen Caroline took a great interest in the Park, and it is to her we owe the Serpentine, formed by draining the different pools then existing, and enlarging the little Westbourne brook. Cricket, which was becoming a popular pastime under George II., was played in the Park, and accidents were numerous. At this time, too, fashion transferred its affections from the 'Ring' to Rotten Row, the old road to the suburb of Kensington, which had been much improved by William III., who had caused it to be lit with a continuous row of lamps at night. During the Gordon Riots, the military were encamped in Hyde Park to the tune of ten thousand men, which caused some jealousy of soldiers in general in the popular mind.

In the days of the French Revolution, when England was fearing an invasion of her shores, Hyde Park saw the first of a long series of Volunteer reviews, inaugurated on the 4th of July 1799, when the new recruits passed before George III. Robberies by this time were few and far between; and the last duel in the Park took place in 1817. During the severe winters of those days, skating on the Serpentine was much in vogue, and gathered a much more fashionable attendance than at present. In 1814 a number of booths were erected on the ice, and country-dances and Scotch reels were executed by the skaters. The year 1814 was an important one in the history of the Park. In April, Louis XVIII. passed through it on his way to Paris, to ascend the throne of his fathers; and the same year saw the visit of the allied sovereigns and the famous Blücher. An immense concourse of people thronged the Park. A large fête was given, and the number of booths and stalls stretched from Piccadilly to the end of the Serpentine. At night, Chinese lanterns illumined the scene. Among other

sights was a mimic battle of Trafalgar on the Serpentine.

And now that the story of Hyde Park has been brought down to our own prosaic times, there is little more to be said about it. In 1820 chairs were first introduced; and two years afterwards the Achilles Statue was set up in honour of the Duke of Wellington. Space does not permit more than a bare mention of the renowned Exhibition of 1851, and of the Crystal Palace erected there, and afterwards removed to Sydenham.

Kensington Gardens can hardly be said to have a history distinct from that of Hyde Park. To a comparatively recent date they were in a wild state, and foxes might have been seen there at the close of the last century. At first, the Gardens consisted of about twenty-six acres. Queen Anne enlarged them, and Queen Caroline added as many as three hundred acres.

The two sister-parks—St James's, and the one stretching along a portion of Piccadilly called the 'Green' Park—have witnessed many changes of fortunes. Before the Restoration, the Green Park was merely a large piece of meadow-land, and only commences its existence as a Park from the reign of Charles II. It was much improved by Queen Caroline, who built a Pavilion Library there. Under George II. it was utilised for reviews of small bodies of troops. In 1749, at the close of the war of the Spanish Succession, a grand fête was held there, a 'Doric' Temple erected, and fireworks blazed at night. Robberies were not uncommon in the Park; and a duel was fought there, in 1771, between Lord Ligonier and Alfieri the poet, which created a great sensation at the time. A few years later, strange as it may seem to us of the present day, the Green Park became a fashionable promenade in the evening, when, after dinner, the gay world assembled there in full dress. Then the view, stretching away over the Thames to the Surrey Hills, must have been very beautiful. This custom of the after-dinner stroll in the Park lasted till the early years of the present century, when the dinner hour became as late as eight or nine, and thus put a stop to this freak of fashion. The Green Park witnessed another great fête in 1814, when a 'Temple' and other erections so beloved in that pseudo-classic age formed the more serious part of the amusements, which included a fair (as in Hyde Park), which did no small damage to the appearance of the grass. In 1842 its modern form was given to the Park; and in 1856 the reservoir of Chelsea waterworks, which stood on Constitution Hill, was filled up.

A much more illustrious history belongs to the twin Park of St James's. Once the lands belonging to a Leper Hospital, they were formed by Henry VIII. into a Park. He also built St James's Palace, and obtained from the Abbot of Westminster some more lands, which he added to the Park. James I. kept a kind of menagerie there, the animals including an elephant, camels, crocodiles, and so forth. Admission to the Park was then probably reserved to the ladies and gentlemen of the court and others in high position. It was a favourite walk with Cromwell,

where he was often to be seen alone, musing, doubtless, on high affairs of state; and Charles I. passed through it on his way to the scaffold. The story of St James's Park is bound up with that of Charles II. That 'merry monarch' was very fond of the Park, sauntering along its avenues, feeding the wild-fowl, chatting to the beauties of the court, or playing a game at Pall Mall: none of these came amiss to him. The different springs and pools were united in one large sheet of water, and trees were planted round the pond called after 'Fair Rosamond'—a favourite spot for lovers' meetings. A new wall was formed, over fourteen hundred feet long, and the new canal was stocked with wild-fowl of all kinds. From 1660 to 1670 as much as £246, 18s. was paid for oatmeal, tares, hempseed, and so on, for the 'birds and fowles in the Park.' Other payments, too, were made 'for fish for the cormorant,' which bird, to judge by its name, was doubtless blessed with a good appetite. A pelican, called by Evelyn 'a melancholy water-fowl,' might also have been seen there, together with Guinea goats, Arabian sheep, roebucks and red-deer. The larger sort of foreign birds probably had their cages situated along the walk, which is still called 'Birdcage.' The ornamental water was much used for skating in the winter. Pepys in his entry for December 1662 tells us how he went 'over the Parke, where I, first in my life, it being a great frost, did see people sliding with their skatees, which is a very pretty art.'

The Mall soon became a fashionable walk by day as well as by night. Private balls and evening parties were then rare, so that the upper classes took their amusement in a less exclusive way than at present. There, from twelve till two, and again at seven, the beaux and belles of those days, in all the Arcadian simplicity of their Watteau costumes, paraded about 1730, and still later, exchanged the simplicity of shepherdesses for the monstrous garbs borrowed from abroad and yeelp 'Macaroni.' Camps were formed in St James's Park in 1736, and again during the Gordon Riots. Near the Spring Gardens, which now, thickly covered with houses, still bear the empty title, was held a Milk Fair, relics of which, in the shape of divers cows, may be seen there at the present day. At the close of the last century the 'Mall' and St James's Park generally lost the high position they had held in the favour of the world of fashion. At this time they were still popular, and the tradespeople and citizens on Sundays flocked there in large numbers. Gradually, however, both Parks have become more or less deserted save by nurses and their charges, and the 'classes' as well as the 'masses' seem to prefer Hyde Park.

Little remains to be said. In 1786 a mad-woman, named Margaret Nicholson, attempted to kill George III.; and on another occasion, Colonel Despard's plot to kill the same king by firing off a large gun on the Parade in the Park was discovered in time, and its author hanged. The once romantic spot, 'Rosamond's Pond,' is at present identified with the 'Guards' and Wellington Barracks; and Buckingham Palace stands on the site of the once famous Mulberry Gardens, formed by James I. in his

laudable desire to promote the production of silk in England. In 1827 St James's Park was altered to the shape and form which in the main it bears at the present day.

DUMARESQ'S DAUGHTER.

CHAPTER XXIV.—AN HOUR OF TRIUMPH.

AT Petherton, during all that fearful time, how closely Psyche followed the march of events; how carefully she reckoned the chances of war; how eagerly she watched the slow advance of the relieving force up the Nile to Dongola and across the desert to Abu Klea and Metamneh! Early in the morning, before even Dumaresq came down to his Spartan breakfast, Psyche was already scanning with anxious eyes the *Times* or *News* she hardly held in her trembling fingers. When Papa went out on the downs for his mid-day walk, Psyche brought forth the big Atlas from the study shelf, and, pen in hand, pounced down, all eagerness, on those strange unknown names, fixing for herself with minute care the exact spot where Wolseley had last arrived, or the utmost point on the wide blank of sand yet reached by Stewart with his desert advance-guard. Here they camped last night: there they go to-morrow. Love had turned the pink-and-white maiden unawares into an amateur tactician of the first water. She read with more than military fervour the latest views of distinguished authorities as to the chances of the Camel Corps; the conflicting opinions of newspaper scribes as to the tactical value of Beresford's Naval Brigade. General Maitland himself could not have been more eager as to the possible merits of the mounted infantry; the very War Office could hardly have been more excited when the van of the relief party arrived at Gakdul.

And all this in the silence of her own heart! For Psyche did not dare to confide in any one. When she heard Papa's footstep on the gravel path outside, or Ida Mansel's voice by the garden gate, the Atlas was hurriedly thrust back into its place on the shelf, the *Daily News* was carefully folded away in the rack by the fireplace, the tears were hastily brushed from those clouded eyes, and the poor self-restrained girl came back at one bound from Khartoum or Dongola to Petherton Episcopi. No one but herself knew with what anxiety she followed every move in that terrible and protracted game; no one but herself knew how often, as she gazed at that hopeless map with its impassable stretches of desert sand and its long curves of interminable Nile, names and places faded suddenly from her failing eyes, and a vast blank alone rose up visible before her—a mingled blank of despair and blindness.

Now and again, to be sure, there were gleams of hope. It was not all pure unmixed despondency. On New Year's day, for example, came a message, a glorious message from Gordon to the relieving force: 'Khartoum all right on the 14th of December.' A fortnight ago, then, Psyche thought with a thrill, Linnell was safe; but, ah, how many things may happen in a fortnight! Yet even so, that cheery message, despatched by a brave man in stifled despair, brightened up her

New Year not a little. For a full week afterwards her sight never suddenly failed her unawares; she walked with a firmer and a freer tread; there was still hope, for Stewart's force was now well on the way for Metamneh. Then came the flicker of victory at the Abu Klea wells—why, now they were almost at the gates of Khartoum. How very short a distance it looked on the map. Psyche measured it carefully by the scale of miles with a pin and some thread: her heart sank within her when she found the result! How many days' journey, how many days' journey, if one came to look at it by that sterner method.

On the 22d, another message arrived from Gordon: 'Khartoum all right. Could hold out for years.' Her heart bounded with joy within her as she read. All would yet be well—and Linnell would come home again.

When Linnell came home, she would tell him all. She could stand it no longer, this misery of misinterpretation. She would ask her father to release her from her promise, that horrible promise that had wrought so much harm. She would fling herself freely, for all her pride, on her painter's neck, and with tears and entreaties beg him to forgive her. A Dumaresq as she was, she would beg him to forgive her.

The end of January, though full of suspense, was indeed a happy time in anticipation for Psyche. Everything was going on so well at the front. The relief of Khartoum was now all but accomplished. Day after day came brighter news. Gordon's four steamers, sent down the Nile to assist Wolseley, had united with the expeditionary force at Metamneh. Then all was still safe in the beleaguered city. Sir Charles Wilson had started for Khartoum; in three days more the siege would be raised—the siege would be raised, and Linnell would be free again! The whole world of England had its eyes fixed during that period of suspense on one man alone; to Psyche, too, there was but one man in all Khartoum, and that man was—not Gordon, but the Special Artist of the *Porte-Crayon* newspaper.

On a Wednesday afternoon towards the end of the month, Ida Mansel stopped with her pony-carriage in front of the Wren's Nest gate, and called out to Psyche, who was busy in the drawing-room, to come in with her that minute to Melbury.

Psyche flung down her needlework at once. Melbury was the nearest country town, and she was delighted indeed to have such a chance; for the evening papers could be bought at Melbury. Every hour was of breathless importance now: nobody knew how soon tidings might arrive of the relief of Khartoum. She would buy a *Pall Mall* or a *St James's* at Melbury: she would get the latest news, that way, twelve hours earlier. So she hurried on her hat and jacket anyhow, and rushed out in haste to Ida.

It was a lovely afternoon, and the sun was shining. Such a January day, Psyche scarcely remembered. The hedgerows were bright with hips and haws; the feathery streamers of the clematis, or old-man's beard, as village children call it, festooned the bare boughs with their flower-like fluffiness; the chirping of robins from the shelter of the holly-bushes made her almost forget it was the depth of winter. Rooks cawed

from the rookery in cheerful content: young lambs already bleated from the pasture-land. Everything spoke of spring and hope. And Psyche's heart was glad within her; for had not England sent out help to her painter? Was not an army well on its way, all to bring her lover back to her at Petherton?

For the very first time, as they drove along through the brisk clear air, Psyche ventured to broach the subject that lay nearest her heart to Ida Mansel. 'Do you think,' she asked timidly, with a deep blush, 'there's any chance—we might hear to-day—that they've relieved Khartoum?'

Mrs Mansel was in her most oracular Girtonian mood. 'Perhaps,' she answered, vaguely, flicking the pony's ear, 'and perhaps not. But, for my part, it simply surprises me to find how much importance everybody attaches to the particular question whether this one man, Gordon—an estimable person, no doubt, in his own way, but one among ten million—does or does not happen to get shot in an expedition on which he volunteered, for the express purpose of going to shoot other people. To my mind, the interest the world displays in his fate smacks of provincialism.'

Psyche, with her poor heart fluttering within her, was not disposed to contest this abstract proposition. 'But there are so many more people in Khartoum with him!' she ventured to interpose, her thoughts all full of one among that nameless unthought-of number.

'So there are many thousand estimable Chinamen dying every day in Pekin, I believe,' Mrs Mansel answered, with chilly persistence. 'It seems to me irrational, in a world where hundreds must die daily, of endless misfortunes, to make so much fuss over a few dozen Englishmen more or less, who've sought their own death over yonder in Central Africa.'

'Perhaps you'd feel it more if you were personally interested in any one of them,' Psyche ventured to suggest, very tentatively, though her heart misgave her for even trenching so far on the dangerous question.

'That's just it, you see,' Mrs Mansel replied, with philosophic calm, replacing her whip in its stand carefully. 'As it happens, we have a friend out there ourselves, you know. Mr Linnell, you remember, that nice young man who was here in the summer, and who painted your portrait, and your father's too, has gone out to Khartoum; and you recollect he's a very old chum indeed of Reginald's. Reginald's very much concerned at times about him. But what I say is, if we who have acquaintances actually in danger there don't make any unnecessary noise or fuss about it—if we're content to look on and watch and wait to see what time and chance will do for them—why should all the rest of the world go crying and shrieking and wringing their hands in wild despair like a pack of children about Gordon and his companions, who are the merest names to them? War's an outlet for our surplus population. It replaces the plagues of the middle ages. There are plenty more soldiers where those came from.'

The tears stood full in Psyche's eyes, though with a violent effort she held them back. But she could talk no more about Khartoum after that. 'Mr Linnell, you remember, who painted

your portrait,' indeed! As if she could forget! as if she could forget him! Oh, strange irony of accidental coincidence! How little she knew! How little she understood poor Psyche's sorrow!

They drove on into Melbury in silence almost, and up the long High Street, stopping at the grocer's and the wine-merchant's and the draper's, till at last they reached the one shop in the place that had now any interest for poor eager Psyche—the bookseller's and news-agent's. There were no placards displayed outside the door as usual. Mrs Mansel pulled up the pony at the door and let Psyche jump out. 'Have the evening papers come in yet?' Psyche asked, trembling.

'No, miss,' the shopman answered, with glib unconcern; 'they're a little late: behind time this evening; but *Punch* is to hand if you'd like to look at it.'

Psyche took it up in a vague, uncertain, half-dreamy way. *Punch* for her indeed! What sarcasm! What irony! Of how much interest to her were its jokes and its caricatures now, with Linnell imprisoned by that mob of fierce fanatic blacks in Khartoum! She opened the paper, hardly knowing what she did. It almost fell from her hands in her intense excitement. Oh heavens! what was this? A terrible joy burst over her as she looked. The cartoon was a picture of two weather-stained soldiers shaking hands together amid loud huzzas and tossing-up of caps, while a body of faithful Egyptian and negro allies looked on from behind and shared in the universal rejoicing of their deliverers. Underneath was the simple legend, 'At Last!' Remote as Psyche lived from the great world of men and events, she took in at a glance what the picture meant. Love sharpened her senses to read it aright. She recognised even the faces of the two leading men. One of them was Wilson; the other, Gordon.

Then all was well! Khartoum was relieved! The steamers with the Sussex regiment on board—those steamers whose course she had followed so anxiously—must have run the gantlet of the Mahdi's fire, and succeeded in forcing their way up the Nile to the besieged city. Wilson had thrown himself into Khartoum at last! And Linnell would now come back to England.

All England was thinking of Gordon that night. Psyche was thinking only of her artist lover.

She turned, on fire, and laying threepence hastily down on the counter, rushed out of the shop with her priceless treasure in her hands, all trembling. At the door, space disappeared for a moment before her swimming eyes; but she cared nothing at all for all that, now: what was blindness itself, with Linnell safe? She groped her way, with her precious paper in her hand, to Ida Mansel's pony-trap; and in a second, as the wave of joy passed through her once more, she saw again as distinctly as ever she had seen in all her life; for no tonic on earth can equal happiness. 'Mrs Mansel!' she cried, 'he's safe! he's safe! They've relieved Khartoum, and defeated the Mahdi!'

'Who's safe?' Mrs Mansel repeated, half incredulous. And Psyche, too proudly honest to answer 'Gordon,' replied with a scarcely conscious blush: 'Why, your friend Mr Linnell! I'm so glad to hear it!'

Ida Mansel took the paper sceptically from the girl's hand. It was that all-too historical number of *Punch* with the famous cartoon, so soon to be falsified, representing the supposed junction of Wilson's reinforcements with the handful of defenders still left with Gordon; and as everybody now knows, it was prepared beforehand, as such things must always necessarily be prepared, in anticipation of the shortly-expected triumph of that futile relief party. But neither Psyche nor her friend was critical enough to reflect, in their woman-like haste, that the drawing and the block must have been put in hand, at the very latest, several hours before the arrival of the last telegrams in that morning's papers. They were not critical enough to remember that *Punch*, with all its acknowledged virtues and excellences, has never laid any claim of any sort to rank as an independent purveyor and disperser of authentic intelligence. They accepted the hypothetical announcement of the cartoon in good faith as so much honest comment upon established fact; and they made no doubt in their own minds that in London that evening the news of Gordon's safety was common property.

Oh, glorious, short-lived, inexpressible delight! Oh, sudden breaking of tense heart-strings! Oh, instant relief from unutterable suspense! Psyche drove back to Petherton beside herself with joy. Linnell was safe, and she would see him again. She had no fear now that he might have died or been killed during the siege. Some supreme internal faith told her plainly that all was well. England had wasted money like water and sacrificed lives by the thousand in the desert, all to bring Psyche back her painter; and now, in the very hour of the country's triumph, should any base doubt dare to obtrude itself on her happy mind that all was in vain and that her painter was missing? No, no, a thousand times over, no! Not thus are the events of the Cosmos ordered. Psyche *knew* he was safe. She *knew* he would come back again.

The robins in the hedge chirped merrier than ever as they two drove back in high glee to Petherton. The sun in the sky shone bright and spring-like. The waves on the sea shimmered like diamonds. Everything was gay and blithe and happy. For Linnell was safe, and Psyche was herself again.

And in many an English home that night, sad hearts were mourning for their loved ones at Khartoum.

(To be continued.)

HOW THE APPLE STANDS TO-DAY.

THE ordinary householder and his wife may be surprised to know that this old-fashioned and ever popular fruit has been and is still causing some stir in the community. No doubt the ripple it makes is only a small one when compared with the big circles caused by circumstances of greater interest to the general public; so that most people will hardly know whether Apples fail or succeed; or if they do, what effect failure or success produces on table or pocket. The fact that the cultivation of the Apple has been allowed to sink into a shamefully neglected

condition is conceded by everybody who has any acquaintance with the matter. Nor is this anything new. It had been written about in the gardening papers for very many years; but as a rule—perhaps without exception—the writers were mere promulgators of fads, and the whole of them failed, inasmuch as the comparative value of varieties was not certainly known or clearly defined. When the seasons of ten to a dozen years ago clouded over agricultural interests, the Apple was smitten hip and thigh; and had it not been for imported fruit during that period, the apple dumpling must inevitably have fallen into desuetude, at least for the time being. Meantime, the British orchardist began to rub his eyes, and when he got them sufficiently opened, he beheld his orchards in the possession of trees, aged, lichen-covered, and totally incapable of responding with certainty to cultural treatment.

But with the return of better seasons apple trees regained fruitfulness, and in 1883 the crop was a good one throughout the country. The opportunity was seized to hold what was called an 'Apple Congress' at Chiswick, in the gardens of the Royal Horticultural Society. The result was to open still wider the eyes, and to allow for the entrance of more light into the minds of the now awakened pomologists. A few facts were deduced, which must form the basis of intelligent apple-culture in the future. Some thousands of dishes of fruit were forwarded to this gathering from all parts of the United Kingdom; and the astonishing number of from fifteen to sixteen hundred distinct varieties were thus brought together. Many exhibitors 'set up' fifty or more sorts, and some from one hundred up to three times that number.

The evil of cultivating so many varieties was fairly exhibited when the varieties recommended for general cultivation by fruit-growers came to be examined. Thus, out of the fifteen hundred odd sorts, less than one hundred were named as worthy of cultivation by four or more persons. About fifty sorts had ten or more recommendations; while only about twenty sorts were recommended by thirty-six to one-hundred-and-one voters.

In the Scottish gathering held in Edinburgh two years later, the results were of a nature almost identical. The remarkable outcome of this census went to show that nearly one-and-a-half thousand kinds of apples were in cultivation throughout the country, the value of which as a whole was very slight. Or, put in another way, it showed that many thousands of apple trees of problematical value were occupying ground and absorbing labour, the place of which could be occupied by from twenty to one hundred sorts in a more valuable manner.

Another outcome of the 'Congress' was to show that the nomenclature of apples all over the country was in a jumble of confusion. Very few collections were altogether correctly named, and some popular sorts were found on the tables under from eight to sixteen different names. It appeared as if a rule prevailed that when some extra good cropping sort had asserted itself in a district—its name having previously disappeared—a local designation was tacked on to it,

and distributed from some nursery establishment as a new thing altogether. If it had other qualities besides that of great fruitfulness, not much harm would ensue; but if the variety was lacking in size or flavour, then it followed that an extra number of trees of an undesirable nature was by this means unwittingly distributed over the country. It would also occur—and as a fact the occurrence was not unusual—that one might order a good variety and succeed in procuring one of no worth.

But perhaps the most remarkable result of all was the final triumph of one 'stock' over all others. The general reader will not of course understand what the term stock as applied to apples means. Nowadays, the almost invariable method of increasing the number of apple trees is by budding or grafting the sort required on to other trees specially prepared for the purpose. These latter are technically termed 'stocks.' Most of the fruit exhibited was accompanied by a card containing, with other information, the kind of stock on which the tree was grown; and it was found that fruit which had been produced by trees on the 'Paradise' stock was, from whatever district shown, superior to all others. The Paradise had been long known for the influence it exerted over the scion which was worked on it, inasmuch as the trees assumed a more dwarf and fruitful habit; but it was now distinctly seen that it possessed the equally important qualification of improving the appearance and increasing the size of the fruit.

In numerous instances, seedling apple trees are employed for 'stock' purposes; and on certain kinds of soil these do very well; but in the crushing competition which is becoming every decade more pronounced, not quantity so much as size and quality will perforce become the factors of success. That is so to a great extent even now, but not to the degree it must attain in time to come.

This and other 'congresses' which followed were, however, only initial proceedings. Some occupiers of orchards, and this especially in the Home Counties, were indeed not slow to put into execution proceedings some of them of an extreme nature. Moderately healthy trees were headed over and regrafted with the best kinds, while the older worn-out subjects were summarily stubbed up and destroyed and young plantations made in their stead; and here and there throughout the country an impetus was given to a more intelligent system of culture. But the ordinary Britisher of whatever calling is slow to move in the adoption of anything new, and in no calling is this so pronounced as in interests connected with the land.

In order to a further improved fruit-culture, a Society named the British Fruit-growers' Association has been and is trying to promulgate the knowledge of improved principles in fruit-growing. In the winter of 1890 a scheme was broached to raise twenty thousand pounds in order to carry out the crusade with increased vigour and greater effect. As one result of the operations of this Society, the Fruiterers' Company of London has been induced to descend to practical matters; and last year (1890) there was instituted a series of prizes for fruits and preserves. At the show of these held in the Guild-

hall, it was palpably apparent that the culture of hardy fruits, of which apples were by far the most conspicuous, is only imperfectly understood. When it is remembered that nearly the whole of the best apples consumed in this country are imported from Canada and the northern States of America, it is apparent that there is verge enough for a more enlightened régime.

In the apple-growing counties of England, finer fruit than the best of the American can be produced; but it is only here and there that cultivators give their trees that amount of attention which enables them to produce fruit of the highest quality.

Again, in many parts of Ireland the soil and climate are fitted to produce fruit of magnificent quality; but hardly without exception is there any attempt to cultivate orchards, and the fruit when ready is often knocked to the ground by means of long poles, instead of being carefully gathered, sorted, and marketed. It has been given on good authority that the Irish could compete with the men of Kent with the highest-class apples.

Then in Scotland, notwithstanding the long-remembered saying of Sydney Smith, there are many districts where quite as large fruit as is common in England can be grown. The only drawback is the lack of colour, which is so attractive in fruit grown under the influence of sunnier skies. At the same time it is noteworthy that Scottish fruit of the right kind, intelligently cultivated and properly sorted, commands as good a price as the ordinary run of American produce, and very much better than Continental, which, carelessly grown, is no less carelessly put on the market.

But the outlook, it will be seen, is becoming still more serious, when it is known that another competitor, who will in a few years rival the American grower as an importer, has sprung up in the form of the Australian colonies. Some four years ago consignments of Tasmanian apples were received in London, and the results were so generally gratifying, that the importation of apples into the metropolis during April and May is becoming a staple industry. The quality and appearance of the fruit are of the very highest class. But more. Two large fruit-growing colonies on the Murray River, with the most complete irrigation appliances in the world, are being rapidly established, and before long we shall have these also competing for a share of our fruit orders.

Under such circumstances it may be questioned by the man of caution whether it will pay to grow apples in this country. The reply to that must be that it only will when made a matter of business. Our gardens and orchards are at present mostly occupied by trees of next to no use, and instead of supplying our own wants, the mass of our apple-supply has to be bought abroad. We have, in fact, decided advantages to set against certain drawbacks. The American, for instance, does not, in the strict sense of the word, cultivate his apples at all. He simply selects a certain few good sorts, sets them out in his orchard, and awaits his crop. The general result arrived at is that one season the crops are abnormally large, and the trees are so much exhausted in the endeavour to mature their crops that the following year is

spent as a recuperative holiday. Thus, leaving out altogether the contingencies of spring frost, the ravages of caterpillars, &c., which also have to be contended with on this side, there is a constant recurrence of seasons when imported apples are more or less scarce. Then, with the exception of the Newton Pippin, our islands can produce a better quality of fruit than America does; and Continental fruit is in the meantime much inferior to ours.

What we have got to do in order to make headway is to grow a very few varieties, and these the best; that is to say, only those which as trees will grow rapidly, keep healthy, bear freely, and mature fruit of a large size. It requires a man to have a special training in order to succeed even then. The writer is acquainted with instances where the best kinds were planted, and yet, through inattention to cultural details, the price of the trees has not been netted in the course of a dozen years. The system known in France as 'petite culture' has been recommended as a solution of the difficulty in this country. But the circumstances are so very different, that it would take perhaps two generations to establish it with success. The Frenchman has from one generation to another been bred to the work. It is with him a second nature, and the results are marvellous.

In Great Britain we have to raise from raw material the like class of men, and at the best it is doubtful if our climate would second him in securing as good a return for his labour. Most exaggerated statements of the profits attainable from apple-culture have been put before the public. Writing from experience, and keeping within the strictest bounds, a bush apple tree will one year with another produce fruit to the net value of one shilling and sixpence. That may appear an inconsiderable sum; but a bush tree when full grown will not occupy more than nine square yards of ground, and an acre so planted means forty pounds.

Starting with one-year-old trees, scarcely any fruit should be allowed to form for the first six years. The growth of the tree will be much more rapid under these conditions, and a fair crop may be expected the sixth or seventh season. The ground of course will be much of it under general cultivation until the trees are, say, a dozen years of age, so that there will constantly be a return from the ground even when nothing is secured off the apples. In no season should any but a moderate crop be taken. In extra-fruitful years the apples should be freely thinned when quite small, and by this means large fruit will be the rule; while in scarce seasons, which are generally the outcome of an overcrop, a good crop will hardly ever fail to mature. Thirty years may be taken as the term of the paying life of the trees. It is not uncommon to net from ten to twenty shillings' worth of fruit from a bush tree in full bearing; but three to four shillings is a more fair estimate, and over all, the eighteenpence per tree may be taken as being neither too sanguine nor too low.

It is absolutely necessary that the right sorts be grown. Warner's King, Ecklinville Seedling, Lord Grosvenor, and Keswick Codling, are examples of what succeed everywhere, being of rapid growth, free fruiting, and producing fruit of

the right size. The English Paradise should be selected, and a course of periodical root-lifting carried out in the earlier years of the trees' existence.

MISS WINTER'S HERO.

MISS WINTER (Christian name Kate) stood at the window of the lodging-house drawing-room, her hands clasped behind her back, looking out at the sea, with a very dissatisfied face. Of what use was it to be rich and pretty and twenty-two, if one could not have one's own way? Fathers were all very well—with a glance at the portly personage in the corner, half hidden behind his newspaper; but no middle-aged father living could even begin to comprehend all the lights and shades involved in a case like this. Laurence had said so himself; and her father had never made any pretensions to finer feelings; he was simply an honest, comfortable, matter-of-fact man of business, and his daughter had arrived at a crisis where those qualities were at a discount.

The state of the case was this. Mr Winter had come to Scotland on some matter of business, and brought his household with him. They put up at one of the Clyde watering-places, and there Kate made the acquaintance of a certain Mr Laurence Glynn, about which acquaintance Mr Winter had expressed himself very freely that morning, and Kate was resenting it accordingly.

'My dear, there's a dreadful draught coming in at that window,' her father broke in upon her meditations. 'Couldn't you shut it? or—What's the matter?'

'Nothing particular,' returned Kate, shutting down the window sharply. What was the use of going over it all a second time? 'I'm going down to the beach; this room is unbearably hot.'

'Very well, my dear; and perhaps I may come after you when I've finished my paper.—Cheer up, Kate; there's as good fish in the sea as'—

But Miss Winter did not wait to hear the whole of that wise saw, neither did she adjourn direct to the beach. A narrow path wound up a low cliff behind, where the coastguard's flagstaff was planted, and thither she bent her steps. There was a circular green bench round the staff, and on the bench sat a handsome young fellow in a brown velvet coat. His hair was a little longer than is customary in these close-cropped days; and that, or a certain rapt absent expression, would have stamped him at once as either poet or artist with most people. Kate, looking at him in the full flush of the warm sunset, felt that it was no light privilege even to know such a man; but having known him, that he—refined and cultivated to such a pitch of perfection—should have laid his fortune at her feet, should have counted her worthy to share his future, the fame that coming days were to bring him, passed all belief. At the sound of her foot on the springy turf he looked round.

'Kate, my queen!'—there was music in his lightest tone—'I thought you were never coming.

Do you know this is the first time I have seen your face to-day? It has been all cloud; no sun has risen for me.'

'I would have come if I could,' said Kate, very truthfully. 'Oh Laurence, I don't know how I am to tell you what has happened, I am so miserable.'

'What is wrong, Kate?' asked her lover, coming down from the clouds and growing suddenly sober.

'This is wrong. Somebody—it's that horrid Mrs Smithson—has been talking to papa about you. She said you—you were idle, that you were over head and ears in debt. I can't tell you what she didn't say; and then papa came up to me, and said he would have no more philandering—that was the very word—about here, and—and that wasn't all.'

Mr Laurence Glynn had turned scarlet and white alternately. He got up from the bench. 'And you agreed with them, I suppose?'

'Oh Laurence!'—Kate's eyes overflowed altogether—'if the whole world said so, what difference could it make to me? Even if I had never seen you, I should have believed in you from your poems. No one but a good man and a great man could have written like that.'

'Then the world may say what it pleases, my Kate.' The young man flung himself on the grass at her feet and gazed up at her as Antony may have gazed at Cleopatra, Dante at Beatrice, Rizzio at his royal mistress. 'Something must be done, however, and done at once,' he said presently. 'I will not lose my Kate for all the fathers or Mrs Smithsons in Christendom.—What was the rest of the tale, Kate? I may as well hear the whole of it.'

'It's that John Petersen, a person who hasn't an idea beyond business and the money market—so everybody thinks him perfection; and he's coming over from Liverpool on Saturday, and papa hopes I mean to be civil to him.'

Mr Glynn's brows contracted. Instead of gazing at Kate, he was rooting up all the clover-heads within reach and hurling them into space. Kate watched the process with troubled eyes. He looked round at her suddenly.

'Kate, you never had any brothers and sisters, I think you once told me?'

'No. But what has that to do with it?'

'A good deal. You are your father's only child; that gives you a grand claim upon him; he would forgive you anything.'

'I don't think he has had much occasion for forgiving me,' said Kate, with a little touch of dignity.

'I know that, dear; but he may have more, or think he has, which comes to the same thing. We must just take the law into our own hands, and carve out our own fortunes.'

'You mean?'—rather breathlessly.

'I mean that you must take me for better for worse without any delay. We are not the first who have been driven to that step, and we shall not be the last. Once mine, Mr John Petersen and Mrs Smithson may go to—anywhere they please.'

Could the poet have been going to say—to Jericho? It sounded uncommonly like it, even to Kate; but she had no time to debate the point; she was completely swept off her feet

by the deluge of eloquence he brought to bear upon her. He pictured the desolation that must inevitably compass all her days, if she meekly allowed herself to be handed over to this narrow-minded soulless worldling; the shattered hopes he himself would carry under all the honours with which his fellows crowned him, and—saddest reflection of all—to remember, that they two had once stood together at the very entrance to Arcadia and lacked the courage to enter in.

Ah me! if one could always sojourn on those exalted heights; but there was the valley waiting at the foot, the sordid details to be gone into, the practical arrangements discussed. The first thing was to get back to Liverpool—that was the poet's headquarters as well as the objectionable Petersen's. Once there, Laurence would procure a special license through a friend who was well up in that kind of thing; and then the deed done, they could choose their own time for informing the powers that be.

They were to slip away to Greenock by separate trains to-morrow afternoon, and go down to the quay and take the Liverpool boat; and then, while Mr Winter was scouring about the different railway stations for the runaways, they would be sailing peacefully over the blue waters beyond all reach of pursuit.

'To think that this time to-morrow we shall be together—not a cloud to dim our gladness, not a jarring note to make discord in the harmony—"Two souls with but a single thought, two hearts that beat as one,"' said Mr Glynn, waving his hand—a shapely and well-cared-for hand—towards the dipping sails on the horizon. 'Of course the railway is the quickest; but there is the telegraph and cross lines, and a hundred chances to guard against, that the sea is exempt from. Kate! we shall both look back upon it as the happiest expedition we ever had—our very first together. The distance is nothing; it will be only too short for the delight we shall crowd into it.'

But all this rapture notwithstanding, Kate went through that evening with a curious sense of oppression at her heart. Her father was her father; she had had nothing but love and kindness, albeit somewhat rough and ready kindness, from him since she could remember. No shadow of trouble had ever fallen across her sheltered path. If it were for any one else in the world than Laurence, she could never have entertained the thought of leaving him; but there were times—Laurence said so—when even the best of fathers must stand on one side. Kate found herself watching him quite tenderly as he sauntered about the room, and hoped he would not mind very much, when he found she was gone.

'I tell you what it is, Kate,' he said, stopping in front of her on one of his peregrinations. 'I don't think this idle kind of life is exactly good for us; we'll go home to our cotton bales again next week. I'll be right glad to get my shoulder to the wheel once more; nothing takes the place of it, even on a holiday.'

Next week! Kate bent her head over her book; she did not feel equal to any comment.

'By the way, John Petersen will be here to-morrow afternoon. I'd a line from him by

to-night's post; so we'll make a grand wind-up and all go back together.'

'To-morrow!' echoed Kate. 'He said Saturday before.'

'Ay; but I think he's wanting a sight of you, Kate: there's a limit even to patience.'

'As long as he has a ledger beside him he will put up without a good many other things,' remarked Kate, getting up and gathering her scattered properties together.

'Don't be too sure of that, my lassie—still waters run deep.'

The weather had broken when Kate looked out next morning; sea and shore were muffled up in a shroud of damp gray mist, known to the dwellers in that region as a 'haar.' Kate gave an involuntary shiver as she thought of the pilgrimage to be begun under its auspices; a bright day would have made such a difference. It was too late for reflections now; but she set about making her necessarily limited preparations with strange want of enthusiasm; that glowing future seemed to have dwindled into something vague and far away; while present surroundings loomed large and life-like instead, after the fashion of the house gables in the misty street; while the rolling hills behind had vanished into blank space. Another of Laurence's similes. Kate herself was not good at ideas of that kind, possibly one of the reasons she was attracted by it in him.

And so the day wore on. By four o'clock Kate found herself rattling into Greenock station. How she had escaped at the last she hardly knew, only here she was, and every now and again a big tear splashed down on her lap and blotted out what landscape was left. Laurence was waiting on the platform. Kate greeted him with something suspiciously like a sob. 'Laurence, I don't like going off like this a bit; it isn't like a real wedding at all.'

'Never mind, Kate. What does a little present inconvenience count for? Think of what lies beyond! See; I've got a cab ready waiting for you.'

The cab was one of a row, and did not appear to be waiting for her more than anybody else.

'Papa is in Glasgow to-day,' said Kate as she got in; 'he went this morning to meet John Petersen. I hope we shan't meet them.'

'I hope not, indeed,' ejaculated Mr Glynn in some consternation. 'Sit well back, Kate. What a good thing we decided to go by the boat!'

Down to the wet sloppy quay, where, jostled by porters and packages, surrounded with noise and dirt and discomfort of every description, they contrived to struggle up the slippery gangway on board a smoky, panting steamer known as the *Bluebell*. There was little of the bluebell element about her beyond the name; and Kate shrank back in unconcealed dismay from the motley collection of passengers and cargo that thronged the deck. Where was the poetry to come in? Was this the white-winged carrier that was to waft them over the summer seas to their earthly paradise?

The deck was an impossibility. As they stood bewildered in the stream of traffic, a little sharp-faced elderly lady, who had followed them up the gangway, and was evidently accustomed to travel, touched Kate's shoulder. 'Pardon me;

I think you would be more comfortable in the saloon; the boat is going to be very full to-night.

They followed her down. The boat was full; they had some difficulty in finding sufficient space to bestow themselves and their wraps.

'I had no idea it was going to be such a crush,' said Mr Glynn, surveying his fellow-travellers with unmitigated disapproval. 'Kate, I'm afraid it won't be quite so pleasant a trip as we expected; still, we are together—that is one bright spot in the gloom.'

Kate nodded rather grimly; somehow sentiment fell flat with an audience of children and nurses on either hand reaping the benefit; and Mr Glynn felt it. After a few more attempts at longer and longer intervals, he suggested taking a turn up above to see how they were progressing. 'The wind is rising, so that will blow the fog away; we may have a fine evening even yet,' he remarked.

'We may,' responded a ponderous matron, taking his observations to herself; 'but I'm thinking we'll be wishing for the fog instead, before we're much older.'

'I don't quite follow you,' said Mr Glynn distinctly.

'I've been this road before, and I know what a wind means when we get round the corner. Why, I've seen this cabin with not a person in it able to hold up a finger, except the stewards.—Are you a good sailor, ma'am?' turning to Kate.

'I don't know; I never tried it more than a few hours at a time,' owned Kate.

'Ah well! I'm thinking you'll know more about it by morning. Hear to that!'

Laurence had vanished. Kate sat on alone, sometimes watching the people about her, sometimes exchanging a word or two with her neighbour, the little elderly lady. Miss Priestley her name was, and she had something to do with a girls' school, Kate found. By-and-by it got dark, and Kate began to wonder if Laurence could have been washed overboard; it was strange he never came to see after her. This was not at all the kind of treatment he had promised last night. Thoroughly uneasy at last, she crept up the brass-bound stairs to the upper deck. The mist had cleared away, but the rain was coming down in sheets, and the boat pitching and plunging in a fashion that Kate was certain was most dangerous, apart from the discomfort of it. A feeling of righteous indignation against her truant lover began to surge up in her breast as she stood there, holding on to the rails.

'By your leave, miss.' A steward bustled past with something in a glass to a miserable crumpled-up object crouching in a distant corner. In the dim light, Kate had not noticed that any one was there. The next minute a fretful high-pitched voice fell on her ear.

'What do you mean by bringing such beastly stuff? Take it away, if you don't want to be kicked out of this.'

Kate launched herself across the space between like a thunderbolt. Could—could that be Laurence? that dragged, battered creature, shivering and trembling like a baby, and railing at a steward in that manner—her hero, her poet, her Sir Galahad!

'Why, Laurence,' she cried indignantly, 'what has come to you? What are you behaving in this way for?'

Mr Glynn was utterly unable to explain. Human nature is much the same the wide world over; in the throes of sea-sickness, even a poet has to take his place with the rank and file. He simply laid his head down on the wet bench before him and groaned.

And Kate? Alas for Kate! Instead of the womanly sympathy that ought to have been forthcoming, she stood and looked down upon him in stony silence.

'You had better ask that steward to put you to bed,' she said presently in quite an altered tone. 'You are not likely to get any better in that state.' And without one backward glance or look at him, Kate turned about and marched down to the stuffy cabin she was to share with the little teacher. That lady was already there, and glanced up at Kate's flushed face. 'Did you find your friend?'

'Yes,' said Kate shortly. 'I found him—disgustingly sick.'

Miss Priestley laughed. 'Sickness is hardly a crime, my dear.'

'It is for a man to go and make a baby of himself, and speak like a—costermonger,' said Kate severely. 'If a little thing like this upsets him so, where would he be with a big thing?'

It was a big question. Kate stared at the flickering lamp as if it was keeping back the answer. 'It serves me right. Why did I ever come?' she cried, suddenly putting her head down on the edge of her berth. 'Oh, if I was only at home again with my father!'

Miss Priestley folded up her nightcap and took the sobbing runaway to her bosom. 'What is it, my dear? Are you in trouble? Cannot I help you?'

'Nobody can help me any more,' sobbed Kate. 'I'm—I'm eloping.'

'Don't do it,' said the elder lady briskly. 'Go straight back again to your father.'

'I can't,' cried Kate. 'I never told him I was going, and he never liked Laurence besides.'

'And seeing that "Laurence" has persuaded you to behave in this way, I should say your father was very well justified in his opinion. Tell me all about it, my dear.'

And Kate did. The boat plunged and ploughed through the choppy waves, rain and spray dashed against the blurred glass of the porthole; the lamp smoked and pervaded the close air with its fumes—a fit setting for the telling of the brief love-story, that had seemed so sweet at the time, and was so humiliating in the retrospect. 'I know how mean it must sound to you,' said Kate, half apologetically; 'but indeed I would not have come away so suddenly if it had not been for that John Petersen coming this afternoon.'

'John Petersen!' echoed Miss Priestley—'the Brunswick Street John Petersen?'

'Yes. Do you know him?'

'Know him! I should think so—he is my nephew.'

'O—oh!'

'And I can tell you,' went on the little lady, 'that he is worth any six of your Laurence

Glynns. You are a very fortunate girl to have made his acquaintance; he is no fair-weather lover.'

'I don't want any more lovers,' said Kate dismally; 'I've had enough to-night to last me for years. I thought when people once fell in love they never changed; and here I feel already as if I never wanted to see Laurence or speak to him again, and I did love him yesterday.'

'Or you thought you did. You must tell the young man you have changed your mind as soon as you get to Liverpool, and then we must telegraph to your father. You will be safe at home again in a few hours more.'

There was no need to telegraph. The *Bluebell* steamed up the Mersey the next morning in a flood of brilliant sunshine, green fields and houses bedded in trees stretching away on the Cheshire side, one straight unbroken line of dock wall on the other. Sailing-vessels flitted past like great gulls; huge steamers lay at anchor, swinging lazily round with the tide. Last night with its rains and storms might have been a bad dream. Mr Glynn emerged from his hiding-place and made terms with the long-suffering steward to help in repairing the ravages left on his personal appearance; after that, he went in quest of his lady-love. Never again would they two travel by water when there was dry land and a railway train to be had; never again would he write one line about that deceitful sea; better run the chance of any number of irate fathers, than go through the mental and bodily anguish he had endured this night; and now that he was able to think about the matter, Kate had shown herself decidedly callous; she had made no attempt to help him, simply gone away, and done the best she could for herself, and he might have been washed overboard for any interest she evinced since. Miss Kate was pretty; she would be an heiress; but Mr Glynn thoroughly understood his own value, and he could not but feel that she had not conducted herself towards him as she ought to have done. He sat down on the sheltered side of the saloon deck and lighted his cigar, the first since he had set foot on this abominable boat, and decided to leave that young lady to her own reflections for a season.

The *Bluebell* was bent on redeeming her character at the eleventh hour; she glided up to the pier-head as if she had been utterly incapable of either pitching or rolling. There was the usual motley crew gathered on the pier—cabmen, porters, policemen, and general riffraff; but surely there was one strangely familiar figure among them, standing under the open shed behind. Was it possible that that could be Mr Winter himself, after coming by this horrible route on purpose to avoid him?

Poets are but men. Bad as the sea had proved, Mr Glynn would have been quite willing that moment to head about and retrace the whole wretched journey. He retired precipitately behind a convenient ventilator to wait the development of events.

The enemy came on board, elbowed his way up the gangway the moment it shot into position. He was not alone, either; with him there was a broad-shouldered, determined-looking young fellow who could be none other than the objec-

tionable Petersen. How they came to be there Mr Glynn neither knew nor cared; the plain fact was all he was able to grasp at present.

'Is there a young lady on board?' Mr Winter demanded of the first steward he encountered—'a tall girl in a brown ulster?'

'With a little old lady? Yes, sir.'

'I don't know anything about the old lady,' said Mr Winter doubtfully. 'You might—Why, Kate, it is you! Child, child! what have you been thinking of?'

Kate had shot out of the saloon like a whirlwind at the first sound of his voice, and was sobbing in his arms. 'Oh papa, papa, I've never wanted you in my life as I've done since I left you! How did you get here?'

'By the train, of course. It didn't take long to find out which way you had gone. A nice chase we have had after you.—Where is that scoundrel?'

'I don't know,' answered Kate, with a careless glance at the corner where she had last seen him. 'I don't want to know anything about him again; he's been sick every bit of the way.'

'The very best thing he could have done,' remarked Mr Petersen; 'there's some good in the fellow, after all.'

Kate was too meek to resent it. Was it not John Petersen's aunt who had been her sole stay through this weary night? She turned round to the little lady, who was standing patiently in the background beside her tall nephew, with quite a burst of gratitude. 'You don't know how good she has been to me, papa; I believe I'd almost have thrown myself overboard if she hadn't been there.'

There was no farewell scene between the young lady and her sometime hero, no parting valediction to the fair future they had planned out together so blithely. Mr Glynn never stirred out of the shelter of that ventilator till he had seen the cab that held his faithless bride and her party safely up the long floating bridge; then he collected his own belongings and departed likewise. Love's young dream was ended.

He wrote a very touching sonnet under that heading a few months later when he read the announcement of John Petersen's marriage in the local paper; and what is more to the point, discovered an editor charitable enough to give him two guineas for it, which exactly covered his share in the expense of that very unsatisfactory elopement.

THE MONTH:

SCIENCE AND ARTS.

THE authorities of the Kew Observatory have given notice that they are prepared to test photographic lenses for the public at stated charges. The tests come under two heads, A and B—the first comprising a thorough test of the instrument, showing its value as a piece of scientific apparatus, the charge for which is half a guinea. The other test, B, is not of such a thorough nature, and the cost is about one-fourth the previous sum. So many persons are now interested in photographic matters, that they will be

glad to have this opportunity of submitting the lenses which they possess to scientific scrutiny. Each lens so tested and passed as efficient will bear a certain mark, which will be engraved upon it at the Observatory; and we need hardly say that the presence of such a mark will much enhance the value of the instrument. But after all, the resort to these tests will be unnecessary to those who are wise enough to buy their lenses from dealers of repute.

It is said that the Swiss adopt a method of hardening the cast steel of which cutting-tools are made which is different from that practised in most other countries, but which is at the same time more efficient. It is also said that examination of steel so treated shows that the hardening is more uniform and penetrates the metal to a greater degree than if carried out by the usual means. Other advantages are also claimed for the system in the metal being less brittle and the cutting properties more durable and better in every respect. The method consists in making a mixture of four parts of powdered resin, and two parts train oil, stirred together with one part of heated tallow. Into this mixture the metal to be hardened is plunged while it is at a low red-heat, and held therein until it becomes cool. Without being cleaned, the metal is again submitted to heat, and is then tempered in the ordinary manner.

A new process for making artificial marble, granite, &c., has recently been patented in France. The raw material is made up of pieces of glass, silica, &c., which are partly fused in a furnace. After this fusing operation, chips of china, porcelain, enamel, or other similar vitrifiable matter—together with pigments if desired—are added, so that in a measure the process may be said to utilise waste products. Various designs either in relief or intaglio may be impressed upon articles moulded from this compound, or the finished product can be enamelled. Articles of various shapes, and intended for useful or ornamental purposes, such as cornices, statuettes, &c., can be thus produced. Another adaptation of the process is in the manufacture of stained-glass windows, which have the peculiarity of being without the usual leaded joints to hold the glass together. In this case the design is worked out in pieces of glass of the required colours in a flat mould, removable partitions being placed between each. Before the mould is submitted to heat, the partitions are carefully picked out, so that the pieces of glass can fuse together and form a complete picture.

Another invention, also of French origin, is that of M. Calmont of Paris, which utilises the sawdust and shavings of a carpenter's shop, which, by a special process, are converted into a very fine description of vegetable charcoal. This is found to be of great value in removing the unpleasant flavour common to certain French wines, and which renders them unsaleable as wines, although suitable for distillation. The charcoal so made is also valuable for filtering purposes in distilleries, for it is capable of filtering forty times its volume of alcohol, whereas common charcoal will only filter one-fifteenth of that amount. In the manufacture, the sawdust from hard and soft varieties of wood must be

separated as a preliminary, because in the process of carbonisation the one requires a very much greater heat than the other before the operation is complete. Shavings are also treated in the same way, after which they are ground in a mill to reduce them to a very fine powder. Great care must be taken to preserve this charcoal from absorbing moisture; and to obviate this risk, it is enclosed in air-tight receptacles until required for use.

The motion to abolish the opium traffic in India, sacrificing between five and six millions of revenue, which was carried lately by a majority in the House of Commons, has led Sir Lepel Griffin, who knows far more about the opium question than most people, to express a very strong opinion upon the subject, and one which will surprise those who have been taught to believe that opium consumption is synonymous with demoralisation. He declares that the excessive use of the drug is quite unusual, and that its moderate consumption in a tropical climate is beneficial; that the cultivation of the poppy is the chief cause of the prosperity of both Princes and people in the native States; that the tax upon it is no burden on the cultivator, for it is paid by the Chinese consumer; and that this tax is therefore not only unobjectionable, but intrinsically the best that could be devised. He describes Indian opium as a luxury, akin to French champagne imported into England, and says that no expert who has lived among, and studied, opium-smoking or opium-drinking people, as he has done, but will declare that alcohol is a hundred times as pernicious as opium.

'The Ocean Life-saving Ladder' promises to be most useful in cases of collision or shipwreck at sea. It is the invention of Messrs Black and Burnett, both of the steamship *Earnholm*, and consists of a wooden ladder, furnished with solid cork-floats, and partly covered with canvas. Unlike the ordinary life-buoy, one of these ladders will support several persons in the water, and its shape and construction allows of its easy stowage and ready access in case of emergency on shipboard. It has been reported upon very favourably by the Board of Trade, and has been submitted to severe experiments. It is obvious that such a useful contrivance is not confined to ocean use, and that it would be a valuable addition to the Royal Humane Society's apparatus at all boating and fishing resorts; while its peculiar construction would fit it for employment in the case of accidents through breaking ice.

At a recent meeting of the Royal Geographical Society, Mr A. E. Pratt related his interesting experiences during an expedition to Ta-tsen-lu, on the eastern borders of Tibet. His primary object was to increase his natural-history collections; but he found time to make many observations with regard to the physical geography of the districts through which he passed. He carried out his intention, formed on a previous journey, of ascending Mount Omei, a spot which is regarded by the natives as one of peculiar sanctity. This mountain is no less than eleven thousand feet in height, and upon it there are between sixty and eighty temples, served by two thousand priests. On one side of this mountain there is a precipice nearly one mile and a third high, perhaps the steepest declivity in the world. Many

thousands of pilgrims annually visit Mount Omei, and a large number of them commit suicide by throwing themselves over the edge of the precipice just described. The mountain is covered with forest and undergrowth, and seems to be a veritable garden of rare flowers.

In a paper recently read before the Franklin Institute, Mr W. McDevitt, Inspector of the Philadelphia Board of Fire Underwriters, dwelt upon certain dangers connected with the electric illumination of buildings. Some of these are due to defective fittings, and the most important is that relating to fusible connections. These are made of a great variety of alloys, some having good electrical conductivity and being slow to heat, while others exhibit weakness when heated and are continually breaking, an accident which tempts a workman to patch up the joints with ordinary wire instead of the proper fuses. Another danger is indicated in the want of some effective method of making splices or joints in conductors, it being a common practice to merely solder such joints, when in case of accident the solder may melt, leaving a loose connection. But the most alarming risk is from the possibility of lightning entering a house where the electrical supply is from aerial conductors, especially where the wires are attached to gas-fittings. In this case the electricity in leaping from the charged wires to the gas-pipes will melt the latter, and a steady blaze of gas from the injured pipe will result.

A new form of Smokeless Stove for domestic use has been invented by Mr H. Heim of London, and it so far meets the national feeling in favour of a home-like open fire, in that the process of combustion is visible although partly closed in by a transparent door of mica. The stove comprises a combustion chamber, at the back of which is a hopper containing coal—and coal of second and third rate quality is available—which is automatically fed into the chamber. The process of combustion can be so regulated that the stove shall give its maximum heat, or can be damped down to the lowest degree possible. Cold air, which is warmed in its passage to the combustion chamber, is admitted to the stove through a number of small apertures; and this mixing with the gaseous smoke from the coal brings about its complete combustion. The heat given out is partly due to radiation from the visible fire, and partly to warmed air delivered into the room from a series of pipes which are coiled round the apparatus, but which are hidden in the casing of the stove.

Mr Clement Heaton's exhaustive paper recently read before the Society of Arts gave a most interesting review of that very lasting mode of decoration, now seldom seen but on Japanese and Chinese vases, known as Cloisonné (enclosed work). The common method of employing this method of ornamentation is, in the case of vases, to work out the required design in copper ribbon of about one-sixteenth of an inch wide, and to solder it to the metal base so that it stands up edgewise. The spaces between are then filled in with various coloured enamels, and the whole surface is then polished down to one level. Mr Heaton pointed out how this mode of decoration with various modifications has been practised for many centuries in Egypt, Persia,

India, and other countries, and he advocates its employment for modern decorative purposes.

A wonderful example of patience in the Chinese is afforded by a consular Report dealing with the manufacture of salt in Central China. Holes about six inches in diameter are bored in the rock by means of a primitive form of iron drill, and sometimes a period of forty years elapses before the coveted brine is reached, so that the work is carried on from one generation to another. During this time the boring, as may be imagined, goes down to an immense depth. When brine is found, it is drawn up in bamboo tubes by a rope working over a large drum turned by bullocks. The brine is evaporated in iron caldrons, the heat being supplied by natural gas, which is generally found in the vicinity of the salt wells.

The Prefect of Police, Paris, acting on the advice of the Council of Hygiene, has lately modified the regulations concerning the use of colouring matters in articles of food. Certain pigments of metallic origin are prohibited altogether: these comprise preparations of copper, lead, arsenic, and compounds of mercury of all kinds. Barium, chrome yellow, ultramarine, gamboge, and alkanet are also interdicted. Many of the coal-tar colours, while prohibited for ordinary articles of food, may be tolerated in small quantities for tinting candies, liqueurs, ices, &c. Tinfoil, which is employed for wrapping sweets and other articles of food, must not contain more than one-half per cent. of lead, or more than one part in ten thousand of arsenic. Similar regulations are laid down to ensure the purity of pewter or copper utensils used in the preparation of food.

Mr F. Oldfield, of 70 Gracechurch Street, London, has invented an addition to the printing-press, and one which can be attached to any existing cylinder machine at small expense, and without interfering with its use for ordinary printing, which is reported upon very favourably. It is an arrangement of rollers and inking slab by which a number of different coloured inks can be applied to one 'forme.' (A forme, we may remind our non-technical readers, is a mass of type in one frame or chase, which in the case of a cylinder machine would be transferred by the stereotype process to one cylinder.) The apparatus is intended more especially for printing large bills or posters in varied hues; and the time occupied in preparing the machine for the process is very little in excess of that required for ordinary black printing. Under the old conditions, a different forme was necessary for each colour employed, a fact very often painfully evident in the result, and shown by one colour not registering with another.

At the annual conference of photographers held lately under the auspices of the Camera Club, London, Mr Sutton described a new and simple process for producing a printing block direct from an ordinary gelatine plate—such a plate, indeed, as is used by amateurs all over the world. The process depends upon the fact that a gelatine plate when developed by certain agents and dried by moderate heat will show an image in relief—that is to say, all the blackened or exposed portions of the plate will be raised slightly above the level of the unexposed por-

tions. The plate so treated is dried, and then submitted to the ordinary electrotype process, by which it is reproduced in copper. The metal is mounted type-high on a block of wood, and is then ready for the press. There are certain technical difficulties which seem at present to militate against the process, one of the chief of which is the circumstance that the amount of relief obtained is hardly sufficient to ensure clean lines in a quick printing-machine.

A new use has been found for the phonograph by certain medical gentlemen who recently brought the subject before one of the learned Societies in London. By means of the instrument, the audience present were able to listen to the reproduction of the curiously-defective speech of two children when they were first placed under medical care. This registered specimen of their elocution was then contrasted with the improved speech which treatment had effected, for the little patients were themselves present, and were able by word of mouth to testify what science had done for them.

The above interesting experience may point the way to another possible and very feasible application of the phonograph. It would certainly be advantageous to some of our public speakers who are notorious for their hesitating manner, and the constant introduction of the familiar 'er, er' between every three or four syllables, if they were to employ a phonograph for home use. They would then be able in the privacy of their rooms to register for themselves specimens of their speech, and to make the instrument reproduce the previously uttered words with every trick and fault faithfully rendered. These faults so convincingly brought before them could then be gradually corrected until they ceased to appear. The phonograph would point out errors with impunity, which if called attention to by a living being would only lead to unpleasantness.

In a paper brought before the Paris Academy, a curious observation relating to long and short sight was recorded. It was stated that an examination of the eyes of wild animals showed that those captured after the age of six or eight months retained the long sight natural to them, but that those made captive before that age and those born in a state of captivity were short-sighted. From this it is argued that shortness of sight is a defect which is incident to civilisation.

Two distinct advances are recorded concerning that tantalising metal aluminium, which chemists tell us is one of the most common of all elements, for it exists in plenty in every clod of clay, but is so difficult of reduction that until lately it has been almost as valuable as silver. Mr H. Greenway claims to have discovered a method of winning it from its original clay by an inexpensive process; and two Waterbury mechanics have, it is said, succeeded in finding a chemical flux which will enable the metal to be soldered. All attempts in this direction have hitherto failed, and this is the principal reason, coupled with other difficulties in working it, which make articles made of aluminium still so expensive, although it can be produced now at a comparatively cheap rate. These lucky mechanics have been offered to name their own price for their

valuable discovery, which is likely to lead to a greatly extended use of the white metal for purposes where its extreme lightness, strength, and freedom from tarnishing will be appreciated.

A correspondent of *Nature*, in referring to the curious manner in which certain insects will revive after being subjected to frost, says that it is a common experience among mountain climbers to find butterflies lying frozen on the snow; and so brittle that they break up unless very carefully handled. Such frozen butterflies he has frequently placed on his hat, and found that on descending to a warmer atmosphere the little creatures recover themselves and fly away. Another writer refers to the fact that insects which habitually hibernate, as larvæ or pupæ, do not suffer from being frozen even for a lengthened period; but that what is known as an 'open' winter, with its alternations of wet, warmth, and cold, is far more fatal to them. He therefore assumes that the coming season, after the unusually rigorous winter which we have experienced, will be, from an entomological point of view, a very favourable one.

'SENDING-IN DAY.'

'NEVER mind, never mind,' says the Artist, in answer to my apologies for calling to-day instead of on 'Show Saturday,' as invited. 'I'm very glad to see you, as I shall make you useful after you have had a look round. This is sending-in day, and the van will call at half-past six for these things.'

Surely there is no man so engagingly unbusiness-like as an artist! 'It is five o'clock now; and 'these things,' some six life-size portraits, must be ready in an hour and a half for the van which will take them up to Burlington House. And upon one, my friend is still working with leisurely care.

'Not half satisfied with this floor,' he says critically, taking three long steps backward from his easel. 'It falls down in the corner in a way good floors do not. Do you see?'

I can see that the 'floor' appears to sink down in one place; but how the defect in its portrayal is to be remedied I am at a loss to understand; and as the artist is evidently fidgeting to set to work again upon it, I leave him, and stroll round the great studio to look at his pictures.

There is no workshop so interesting as that of the artist who has reached success. Here, I see my friend's whole artistic career on the walls: his first pencil and chalk sketches, rough and unfinished, but bearing that boldness of outline which stamps them as the work of a cunning hand in its youth; his earliest attempts at portraiture in oils, rough again, but wearing still more markedly that mysterious 'something' which raises them far above the 'finniking' work of an ungifted hand. And so, step by step, I trace his progress through studies of living models, and friends, till I come to his first 'accepted' picture, whence dates his success. Between that and the portraits whose paint is scarcely dry, there are few landmarks; and their paucity speaks eloquently of the painter's skill.

'That will do, I think,' says the artist suddenly. 'How's that floor now?' and he backs across the studio to inspect his handiwork at long-range.

I turn from the 'Portrait of a Lady,' and look. The polished parquet floor, down which the painted piano threatened to slide a few minutes ago, is now level as that on which I stand; but how the thing has been done, or where the brush has been applied, I can't for the life of me discover.

'What!' exclaims the artist. 'You don't see? Why, look here! All I have done is to deepen the shading there at the angle of the wall, and throw up the light just here. Simplest thing in the world!'

No doubt it is, like everything else, when you know how to do it; but I don't, and am still trying to probe the secret of the optical illusion wrought by a few deft brush-strokes, when there is a knock at the door, and 'the photographer' is announced.

'Ah!' says the artist, throwing aside his paint-brush and rubbing his hands, 'I've been waiting for him. We have to do the Duchess before we nail her up, and must get to work at once before the light goes.'

'Her Grace the Duchess of —' is gazing benignly at us from her easel; and while the photographer prepares his apparatus, we arrange the portrait in the best light. It is a dainty operation this of photographing a picture: the canvas offering a plane surface, the camera must be adjusted exactly square with it; let one side of the portrait be more remote than the other from the lens by half an inch, and that side will appear 'drawn out' in the photograph. Therefore, the preliminaries take up some little time.

'Tell us when you are going to expose,' says the artist to the photographer. — 'We must remain quite still while the process is going on,' he explains to me. 'This floor is a trifle shaky, and the least vibration would spoil the lines.'

Accordingly, when the photographer declares himself ready, we betake ourselves to the tea-tray in the far corner of the room; and have settled down comfortably before he removes the lens-cap. I had imagined that a picture could be photographed in the few seconds required to take a living subject, and am astonished to hear that the 'exposure' must extend over at least half an hour.

'Half an hour when the light is good,' says the artist, pouring out tea; 'but we shall give Her Grace forty minutes this evening, as it's rather dull.'

The time passes quickly enough over tea, cigarettes, and chat. The artist demands my indignation with one of his clients whose behaviour has been most unreasonable from an artistic point of view. 'He gave me sittings for a month last February,' he says; 'and I told him I thought the picture would be finished in time for exhibition last year. Well, as it happened, my hand was out, and it wasn't finished in time; and he was disappointed about that. Then I had a lot to do, and kept it by me for a while, he having gone back to Scotland in the meantime. When I took it up again, I found I wanted a few more sittings, and asked him to come down for a day

or two. I got him down; but he wasn't at all pleased about it. And then, what d'you think? He said I had kept him waiting long enough, and he would be glad if I'd name the day I could send him the picture!'

I try very hard to look surprised at such conduct, but fail utterly. Not being an artist, my secret sympathies *will* lean towards the client who has been waiting over a year for the completion of his order; for there is the picture staring me in the face, destined for the 'New Gallery,' where it will spend another four months out of the owner's reach.

'People *are* so unreasonable,' continues the artist plaintively. 'What can it matter waiting a few months? They will get their pictures eventually.'

'What are you photographing the Duchess's portrait for?' I ask, by way of turning the subject; for the artist has worked himself into a quite unnecessary state of irritation.

'Her friends,' he replies shortly. 'People nearly always ask me to have their portraits photographed before they leave the studio; and a precious bother it is when I am pressed for time.'

At length the photographer replaces the lens-cap and wheels his camera aside.

'Come!' says the artist, jumping up; 'to work! We will begin with the Duchess: lend me a hand to lay her flat on her face on the floor and nail her up.'

It does not sound a respectful way of treating a Duchess; but under the artist's directions I spread a sheet on the floor and help him to lay the picture face downward thereon. 'Nailing up' is a very simple process: it consists of removing the wooden buttons which hold the canvas on its stretcher into the frame and substituting nails for them. The wedges at the corners of the stretcher are tapped home till the canvas is almost as tight as a drum-head, and the picture is then ready for its labels.

'Don't you pack them at all?' I inquire, as visions of priceless pictures rattling loose in a van over the London streets rise to my mind's eye.

'Not allowed,' replies the artist. 'They would not be received if sent in a case.'

'Aren't you afraid of accidents?' I ask, aghast.

'They don't often come to grief,' he answers carelessly; 'but I once saw a picture of —'s' (naming a famous R.A.) 'which had been pricked all over with a nail or gimlet or something. But *that* wasn't an accident; it was done intentionally, out of spite or mischief; but by whom, no one knows to this day.'

The Duchess is 'nailed up' now; so we restore her to the easel and turn to the 'Portrait of Miss W—.'

'Hold her up a moment whilst I put the sheet straight,' says the artist. 'She is standing on her head; but it doesn't matter.'

With a duster in each hand, to avoid tarnishing the new gilding of the frame, I stand, studying the curious effect of the light as it strikes through the canvas, showing up the flesh tints like a transparency. Suddenly I see something which draws an involuntary 'Oh!' from me.

'What's the matter?' asks the artist.

I feel myself growing pale as I break it to him. 'There is a hole in this picture—a ragged cut, an inch long.' I look round fearfully, half expecting to see the artist sink fainting on the floor.

But he doesn't do anything of the kind. He says calmly: 'Ah! Just wait till I've lighted my pipe, and I'll put it to rights.—Now, where is it?'

I point out the hole, which seems to have been made by a broad knife, close to 'Miss W——'s' shapely nose. It looks very serious; but in two minutes the artist has put with his palette knife a large varnish plaster on the back of the canvas, and only the closest scrutiny can discover the blemish in front. I don't know why it should be so; but the awe with which I regarded the artist's masterpieces is a little toned down by this trifle.

'Van's at the door, sir,' says William, the studio factotum, at this moment.

'Tell the man to wait,' replies the artist dreamily. He is absorbed in contemplation of his 'Portrait of a Lady,' and has no ear for mundane things. 'I must do it,' he says at last aloud to himself. 'There is something the matter with her knees.' He takes up his palette, and is beginning to dabble on it. I take him kindly but firmly by the arm.

'Look here,' I say; 'the van is waiting, and the pictures must be in by eight to-night. We have four more to nail up; and you have the labels to write for the whole lot. Is there time to do any touching up now?'

The artist put his paint-brush in his button-hole and looks at his watch. 'A quarter to seven!' he says in dismay. His palette is discarded, and in two seconds more he is at his desk scribbling 'labels' as fast as his pen will travel.

'Number One,' he says, writing. ('I always number them in the order I want them accepted, you know; if they take One, Two, and Three, they may reject Four if they like. You see?') ('Go on!' I interpellate.) 'Name—Portrait of H. G. the Duchess of —. That's right. One railway luggage label to hang over the front of the picture, and one to stick on the back of the frame. Get the paste-pot, like a good fellow, and stick them on.'

I obey; but as soon as I leave the artist's side, he is out of his chair muttering something about 'that woman's knees.'

William comes in again to say the vanmen are growing impatient.

'You will be late!' I cry, as I see the artist, brush in hand, before the 'Portrait of a Lady.' 'Can't you do what you want on varnishing-day?'

'Varnishing-day' is that on which exhibitors are admitted to the Academy to put any final touches they wish to their pictures. I haven't the least idea what or how much the artist has to do to those 'knees;' but I do see very plainly that if some one does not save him from himself, his whole array of pictures will be shut out as 'too late.'

It is no time to stand on ceremony. I summon William, and with his aid, forcibly remove the lady with the defective knees from her easel and lay her on the floor to nail up. The artist goes

unwillingly back to his desk to finish the labels, and at half-past seven everything is done. The men are called in, and in spite of the artist's 'help,' succeed in stowing the pictures safely in the van.

'I daresay they'll get up to Piccadilly by eight o'clock,' he says cheerfully, as the driver starts off his horse at a gallop. 'But if they don't, they don't.'

'And they'll be shut out?' I inquire.

'I suppose so,' replies the artist light-heartedly. 'Come in and have a pipe before you go. That woman's knees haunt me,' he adds with a sigh.

THEN AND NOW.

IN fables of the Golden Age

No more delight our poets seek,
For, now the North has waxed so sage,
The Goth is wiser than the Greek.

Before the might of Learning's powers,
The myths and wisdom of the Past
Have perished like the autumn flowers
Before the icy northern blast.

The scalpel and the microscope
Demand the laurel of the lyre:
Alas! what later bard can hope
To wake for these the ancient fire?

Sweeter it is to shut our eyes
To all that we have lived among,
And seek in dreams the sunny skies
And hills that saw the birth of song;

The time that held the Poet's name
As holy, and his native vale
Heard sweeter notes than ever came
From any thorn-stung nightingale;

When every youth whose soul was moved
To poetry from early years,
Was by the Muses well beloved,
And held in honour of his peers;

And every maid with mind above
The level of the vulgar throng,
Was priestess of the Queen of Love,
Or sibyl of the Lord of Song.

PRICE 1½d.

SMALL HOLDINGS.

THE overcrowded condition of our great towns, largely traceable to the migration from the country of the agricultural labourer, and the consequent increased competition for employment in town-life, taken in conjunction with the depopulated state of the rural districts, presents a social and economic problem which for some time past has attracted considerable attention. There appears to be a great and growing interest in the subject of Small Holdings, more especially since it is being dealt with in the British Parliament by the Government of the day. Unsatisfactory features of town population, such as the question of the 'unemployed' and similar evils, are held to have an immediate connection with the state of the land; and it is generally agreed that the existence of a numerous and prosperous peasantry conduces to national safety; while the more general distribution of land in Great Britain would have a most beneficial effect on the contentment of the people.

There is also practical concurrence in the view that an increase of small cultivators would be a distinct national and social gain; but opinions differ in regard to the economic advantages. The balance of evidence appears to be favourable to the greater productiveness of small holdings over large ones, and this is probably due to the industry exhibited by the small cultivator, who, even if only a tenant, has a direct personal interest in the results to be obtained.

There seems to be no doubt that landowners are now generally willing to devote land for the purpose of small holdings, the demand for which is unquestionably active in England and Wales, though less so in Scotland. In the latter country, it is believed that the rural population would more readily accept small tenancies; and even in England and Wales the ambition of small cultivators is apparently a good deal in that direction. This may be due to the fact that ownership entails certain responsibilities, which cannot be thrown up at any moment without perhaps entail-

ing a considerable loss; while a tenancy, on the other hand, gives comparative independence, with no prospect of any serious sacrifice on relinquishment.

It should be noted that this question of Small Holdings is distinct from that of Allotments. An allotment has been defined as a piece of land held and cultivated by a man who gains his living by weekly wages, and who cultivates such land with the primary object of supplying his family with vegetables and similar articles. Small holders—that is, holders of not less than one acre and not more than fifty acres—may be divided into two classes—one getting a living from the land by raising produce for sale; the other partially employed in some other occupation, but devoting spare time and money to cultivating land. The one relies on the land for subsistence; the other uses it as an additional means of subsistence.

Owing to the absence of trustworthy statistics, it is difficult to determine whether there has been of late a reduction in the number of small owners and cultivators of land. The consensus of opinion is, however, that until quite recently there has been a considerable diminution, the process having been checked by the difficulty in letting large farms, and perhaps by public opinion having changed in favour of small holdings. Up to the year 1851, the agricultural population was increasing; but from that year to 1881 it diminished; while the number of farmers, according to the census returns of 1881, is shown at almost exactly the same as in 1851, notwithstanding that three million acres have been added to the farmed area of the country. The number of farmhouses formerly inhabited in connection with small holdings, but now utilised to a large extent by agricultural labourers, confirm the inference that such holdings have been acquired by capitalists, in pursuance of the policy of consolidation which prevailed prior to the recent depression. Changes in methods of cultivation have conduced to a like result. For instance, the conversion of land into pasture entails the provision of build-

ings for wintering stock; and small owners, unequal to the outlay, sold their land to adjoining proprietors who possessed the necessary buildings. Recent experience has greatly modified this practice of consolidation, and many landowners are anxious to revert to smaller farms, but are debarred by the heavy expenditure necessary in providing buildings, which they are unable to afford, and which would not yield a sufficiently remunerative return.

Up to thirty years ago it was the avowed policy of leading statesmen to preserve as far as possible the practice of hereditary succession to handed property. This has been carried out directly by the law of settlement, and indirectly by the different taxation of real and personal property, the law of primogeniture, advances made by State aid for improvements, and the difference between the publicity of bills of sale and the private nature of mortgages. It will be observed that in all these cases the tendency of legislation had been to relieve the landlord from the necessity of finding ready-money, with a consequent disinclination on his part to sell land. The object has been to prevent the dispersion of large estates, and small holdings absorbed from time to time in such estates have remained attached to them; and thereafter, if purchasable at all, only in large quantities.

The enclosure of common and waste lands is another legislative cause for the diminution. Commonable rights, such as pasturage, fuel, and wood for repairs, are manifestly of extreme value to the small cultivator, and such rights necessarily ceased on enclosure. The labouring population, to some extent from ignorance, but mainly owing to poverty and consequent lack of representation, have been practically ignored in the settlement of enclosures. Actual commoners no doubt were recompensed by the possession of a freehold; and the sale of lands to pay enclosure expenses tended to increase the number of small owners, though probably only temporarily. On the other hand, the small owner, unconnected with a manor, and unable to prove a true prescriptive right, who had utilised an adjacent common for pasturage and so forth, lost his benefits on enclosure without receiving any compensation whatever. Between 1760 and 1867 nearly seven and a half million acres were thus enclosed; and although public interests have probably been promoted by the improvements effected, the practice has deprived the agricultural labouring class of facilities for and incentives to small cultivation.

An obstacle in the way of increasing the number of small holdings is found in the legal expenses incidental to land transfer, which are practically prohibitive to the class of persons from whom the would-be purchasers are drawn. Simplification of title with lessened cost would, it is believed, have a beneficial effect on the multiplication of small ownerships.

The existing facilities may be dismissed in a few words. Those afforded by legislation are the

provisions of the Building Society and Industrial and Provident Societies Acts. The terms of the Building Society Acts are general; and although the prevalent impression is that they apply only in towns, there seems to be nothing to prevent their being taken advantage of for the acquisition of small holdings. As a matter of fact the measures have been of very little avail for agricultural purposes.

In considering the further facilities to be afforded there are important objects to be kept in view. The intending occupier must be assisted by loans on reasonable terms if he is eventually to become owner; and the land must not only be available in different districts, but must be eligible for small cultivation and in plots of various sizes, to meet the varied requirements of the class of holders it is desirable to attract. For the State to undertake and administer transactions for the creation of small holdings would be an impossibility without a large staff of officials, involving heavy expense. Centralised management would probably fail to estimate local demand, to select suitable land, and successfully decide between conflicting applicants. These conclusions point to the local authorities as the instrumentality through which the increased facilities should be afforded.

It appears to be unnecessary to give local authorities compulsory powers for the purchase of land, as sufficient can doubtless be obtained by voluntary agreement. As regards the disposal of the land, it is unquestionably to the ratepayers' interest that a system of ownership should be adopted in preference to that of tenancies. For the local authorities to embark on a landlord's responsibilities would mean either losses in bad seasons by remissions of rent, or in not yielding to pressure for reductions they would become unpopular landlords, whose action would contrast unfavourably with that of private owners. Then, again, the system of purchase would obviate to a great extent the difficulty as to providing buildings. An owner will make every effort to supply himself with what is necessary, and gradually secure sufficient accommodation for his purpose. At the same time he will be providing additional security for the advance made to him.

Turning to the financial aspect of the scheme propounded by the Select Committee on Small Holdings, it is that five million pounds of public money should in the first instance be lent to local authorities in Great Britain, out of which they may advance to intending purchasers of land sums not exceeding three-fourths or four-fifths of the purchase-money. The suggested method of repayment has certainly the merit of novelty. It is not proposed that principal and interest should be repaid by fixed annual instalments, but that a principle to some extent analogous to the Scotch feu should be adopted. Repayment is to be effected on a plan which will allow of a periodic reduction of charge until it has reached a small proportion of the original amount, and this unpaid portion will be represented by a quit-rent or feu in perpetuity. By this system the owner will have in view successive reductions in his liabilities; while the local authorities will, by the time the repayment takes the shape of quit-rent, be almost able to pay their debts to the State, with the advantage of

being the perpetual holders of that rent in return for the use of their credit.

The scheme offers unexampled facilities to a section of the community which has fair claims to consideration, and it is recommended as affording a practical and unobjectionable way of meeting the demand for land nationalisation. The novelty of the proposals, however, makes it expedient that legislation should proceed tentatively and with caution. A measure on the foregoing lines has recently been unanimously read a second time in the House of Commons, and, subject to amendment in detail, will doubtless become law.

Another contributor writes to us from England on the practical aspect of small holdings :

So much has been written and argued on this subject, that, from a theoretical point of view, it would seem almost exhausted. But the writer having had practical experience, desires from this point to give some information. Eight years ago he became possessed of a property of about six hundred acres in a ring-fence, and at the end of five years the whole farm was thrown on his hands in a bankruptcy. There were heavy charges on the land in the way of taxes, rates, and mortgages ; but it was tithe-free. As no tenant could be found to hire the farm, the landlord let off what he could of it, and succeeded in the first four months of his efforts in getting enough taken to cover all the charges, amounting to about one hundred and seventy pounds.

With one exception, every tenant had started in life as a working-man, and with his savings he entered on the holding. The occupations varied from three to forty acres ; and the first set of tenants were four in number. The holdings have gone on increasing till there are now fourteen tenants. Some have done so well that they are taking more land ; and each year shows a wider margin of cultivation.

The land is chiefly arable, and the rent for most of this is £1, 6s. 8d. an acre, rates and taxes free, though some portions let for as much as £2, 5s. Only one of the tenants has a house ; but the buildings on the farm are reserved for their common use.

The tenants are chiefly labourers with savings, or else petty village tradesmen keeping a horse and cart or pigs. Two of them also are cow-keepers ; and to encourage this, special provision is made in the agreements for the growth of sainfoin in the fields, which, though the fact is not generally known, is a wonderful butter-producing forage. Sainfoin will last seven years in the land ; and when fed, instead of being constantly mown, will become the basis of an excellent meadow. The tenants all hold by written agreements as yearly tenants, and their rent is made payable quarterly. They are allowed to sell wheat straw and clover hay ; but in consideration of this, are bound to bring no charges on leaving, under Part Three of the first schedule of the Agricultural Holdings Act, 1887.

The working of the system so far has covered about half the property, and the gross rent for the holdings will amount for the ensuing year to £420. Three years ago they were only £176 ; two years ago, £196. It is believed that in three

years more they will reach £500, which was the rent of the property in 1886. It must not be imagined that there have been no drawbacks in this. Four of the tenants threw their holdings up at the end of the first year. Fresh tenants, however, are coming forward for them.

The initiatory work of mapping-out and measuring the land required no common care. Care, too, had to be exercised in the admission of tenants, and caution as to letting them have more land than they could manage. But the experiment has now gone on so far that the writer believes he has the elements of a self-improving village ; and that in time to come the young men will look forward to being small farmers under him, and find in their small holdings a useful employment for their savings.

The landlord himself farms one of these holdings, and he finds that by corn-growing alone he can pay the rent and cost of cultivation and get a fair profit also. He has done so even with wheat ; and in August last year he estimated that three acres of oats, and one of wheat, the total cost of growing which up to harvest had been ten pounds, would give him a return in grain and straw of over thirty pounds.

It is not generally known that in the present day, when the low price of wheat is put forward as a plea for lowered rents, wheat straw fetches such a high price that it alone will pay the rent and rates of the land which grows it. And it is observable that these small tenants look on their wheat as their special paying crop.

In conclusion, it must be added that the rents are not merely payable, but paid ; and the quarterly system of payments is found to work well.

DUMARESQ'S DAUGHTER.

BY GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,'
'THIS MORTAL COIL,' ETC.

CHAPTER XXV.—AND AFTER.

At the garden gate, Haviland Dumaresq met them, with that strange far-away look in his wandering eye which, as Psyche knew—though she knew not the cause—surely and certainly foreboded headache. His glance was dim and his step unsteady. At sight of them, however, he roused himself with an effort ; and raising his hat with that stately old-fashioned courtesy of his, which gave something of princeliness to Haviland Dumaresq's demeanour at all times, he invited Mrs Mansel to leave the pony standing at the gate, while she came in herself for a cup of tea in their little drawing-room.

'He won't stand,' Ida said ; 'but perhaps I can tie him ;' and with Dumaresq's help she proceeded to do so. Psyche could no longer contain her news. 'Papa, Papa,' she cried, 'have you heard what's happened ? It's all right ! Khartoum's relieved, and—Mr Linnell's safe again.'

It was the first time since the painter's departure that she had so much as mentioned his name to her father. Haviland Dumaresq started with surprise at the unexpected sound and at Psyche's blushes. The news seemed to rouse him and quicken his dulled sense. The far-away look

died out from his eyes, as he answered with a gasp that to Psyche said much: 'I'm glad to hear it; very glad to hear it. That young man's danger has weighed upon my soul not a little of late. I've thought at times perhaps I might have been in some degree answerable for having sent him out on that fool's errand. But all's well that ends well, thank goodness. Military events matter little as a rule to such as me. The silly persons by whose aid kings and statesmen play their deadly game of skill against one another count for not much individually on the stage of history. We reckon them by the head; so many hundreds or so many thousands swept off the board. Well, what's the next move? Check, Kaiser! check, Sultan!—But with this young man, it was a different matter. He had burst into our horizon and crossed our orbits. The comet that swims once distinctly into your ken interests you far more than the crowd of meteors that career unseen through the infinity of heaven.' He rang the bell for the one tidy maid-of-all-work. 'Maria, tea!' he said with a lordly gesture, in the voice in which a sovereign might give commands for an imperial banquet to chamberlains and seneschals.

'The government must be infinitely relieved at this success,' Mrs Mansel remarked, trying to break the current of the subject; for this narrow and somewhat provincial insistence upon the fate of the one young man whom they all happened to know personally vexed her righteous Girtonian soul by its want of expansiveness. Why harp for ever on a single human life, when population tends always to increase in a geometrical ratio beyond the means of subsistence?

'Yes,' Dumaresq echoed, away up among the clouds still, but bringing back the pendulum with a rush to Linnell once more. 'No doubt; no doubt.—And I'm relieved myself. I, too, had sent my own private Gordon to the Soudan unawares; and it's cost me no little in mental expeditions to raise the siege and release him unconditionally. But no matter now, no matter now.—It's all over. He'll come back before long—and then I'll be able to pay him at last for the portrait he thrust upon me, uncommissioned, before leaving England.'

Psyche glanced up at it where it hung on the wall—that portrait of her father that she had so loved and watched through these weary months long—that portrait into which, as she often fancied, Linnell had poured the whole strength and energy of his pent-up nature. Ida Mansel's eyes followed hers to the picture. 'It's a most striking piece of work, certainly,' the Girton-bred lady remarked with condescending grace. 'Not niggled and over-elaborated, like so many of Mr Linnell's performances. As a rule, our friend seems to me to walk backwards and forwards too much while he's painting a canvas. I often advised him to sit more still. If you watch any of the great masters at work, I always say, you'll see them seated so close at their easels, and so certain of the value of every particular touch, that they never need to look at the total effect they're producing at all. That's art: that's the master's way of working. Corot said there were certain pictures of his which he never really saw in any true sense of the word till they'd been signed and framed and sold and

paid for. How much better that than this perpetual niggling!'

'I think Mr Linnell paints beautifully,' Psyche cried all aglow, her heart beating hard in righteous indignation at the bare idea that any one could venture thus coldly to criticise her divine painter at the very moment when he had just escaped from that deadly peril of his life in Africa. 'And as to niggling,' she went on, emboldened by love into something that dangerously approached art-criticism, 'it seemed to me, when I watched him at work, every touch he added to the pictures, and especially to Papa's, brought them one degree nearer to truth and nature.'

Mrs Mansel looked up with half-contemptuous surprise. This country-bred girl, who had never even seen an Academy or a Salon, far less the Vatican or the Pitti Palace—this village child give *her* lessons in æsthetics! 'You may niggle and niggle away as long as you like,' she answered coldly, 'but you can never get the thousands of leaves that quiver on an aspen, or the myriads of tiny lines and curves and shadows that go to make up one human face of ours. Not mechanical accuracy and embarrassed detail make the great artist: a judicious parsimony of touch and wealth of suggestion are what go to produce true pictures.'

Psyche gazed up at the portrait reverently—and was silent. In the matter of mere technique she felt herself wholly unfit to pit her own criticism against Ida Mansel's; but as a faithful exposition of all that was best and greatest in Haviland Dumaresq's face and figure—the man himself, and the soul that was in him, not the mere outer body and husk and shell of him—she felt certain in her own heart Linnell's picture was a triumphant success and a veritable masterpiece. And all the world has since justified her. The philosophic depth, the logical clearness, the epigrammatic power, the proud reserve, the stoical heroism, the grand self-restraint and endurance of the man—all these were faithfully mirrored or delicately suggested in the endless lines of that admirable portrait: not a shade but spoke Haviland Dumaresq's character; not a tone of expression but helped to swell the general sense of a forceful and self-sufficing individuality. To look upon it one could almost see those proud lips part, and hear that calm and measured voice say in haughty self-consciousness, as once to Linnell: 'I must go through the world in my own orbit, come what may. I move on my circuit, undeterred and unswerving.'

Ida Mansel, indeed, with her Girton-bred precision and her cultivated narrowness! She to pretend to sit in judgment upon such a soul as Charles Linnell's! Could she see in original or in portrait either those traits that Psyche admired the most? Could she understand the real granite greatness of Dumaresq's character, or the piercing insight with which Linnell had read it in his face and impressed it in imperishable colours upon his canvas? Did she know what the highest side of art was aiming at, at all? 'The worst of this cut-and-dried modern higher education,' Psyche thought to herself, falling for the nonce into that hereditary trick of unconscious generalisation, 'is that it educates women beyond their natural powers, and tries to raise them into

planes of thought for which nature and descent have never equipped them beforehand.'

But what, in her happiness, did she care for such strictures? Her painter was safe, and she could afford to laugh at them.

'It's a very good portrait, though,' her father said, taking up the cudgels half unconsciously for his daughter's lover. 'I don't pretend to understand its technical qualities myself, of course—art, I suppose, can only be adequately judged or understood by those who themselves have essayed and appraised its practical difficulties: but if I know how to read my own character (and I think I do, from an objective stand-point), Linnell, it seems to me, has managed to put it very cleverly on canvas. In considering a portrait'—

But even as he spoke, he was interrupted by Reginald Mansel's sudden incursion, holding in one hand an evening paper, and all agog with ill-suppressed excitement at the strange and unexpected tidings contained in it. Psyche knew in a moment what their neighbour had come for. He had just learned the news of the relief of Khartoum!

'Seen to-night's *Pall Mall*?' he asked with emphasis as he burst in with the eager face of a man who comes as the bearer of important information.

'No,' Dumaresq answered. 'But we've heard the news already, for all that. Mrs Mansel and Psyche brought it from Melbury. I'm glad they've succeeded at last in getting there.'

Mansel stared back at him in mute surprise. 'Glad?' he exclaimed, bewildered. 'Glad? Glad of what? I know you're little interested in military affairs, and push your horror of war to an extreme; but, hang it all, Dumaresq, you'll admit yourself this is going a little too far for anything. Glad that the Mahdi's got into Khartoum! Glad that our people have all had their throats cut by those rampant savages!'

Dumaresq clutched the paper with a thrill of astonishment. 'Had their throats cut?' he cried, gasping. 'And by those savages, too?—Why, what do you mean, Mansel? They told us all was well at Khartoum.'

Mansel shook his head as he pointed with his finger to the latest telegrams. 'No, no,' he answered testily. 'That's all wrong, all unfounded. Here's the genuine news from the seat of war. Wilson's steamers have got up to Khartoum, only to find the city taken, and Gordon and every Christian soul in the place massacred in cold blood by the Mahdi's people.'

For a minute or two Dumaresq, Mrs Mansel, and her husband all gazed together at the fatal telegram. Absorbed in the news, they forgot all else. The philosopher wrung his hands in horror. 'Poor Linnell!' he cried, half under his breath. 'I acted for the best! I acted for the best! But I did wrong, perhaps, in dismissing him so abruptly.'

Mrs Mansel turned round to look after her friend. 'Goodness gracious!' she exclaimed, with a little scream of horror, 'just look at Psyche!'

They turned and saw. The shock had unnerved her.

Psyche was sitting bolt upright in her chair.

Her cheeks were pale and white as death. Her bloodless hands lay motionless on her knees. Her eyes were staring wide open in front of her. But she saw nothing, heard nothing, felt nothing, knew nothing. She was cold as if dead. Had the shock killed her?

That self-same evening, in Chancery Lane, at the office of Messrs Burchell and Dobbs, family solicitors, the senior partner in that flourishing firm looked up from his perusal of the *St James's Gazette* and remarked reflectively: 'I say, Dobbs, that poor client of ours, C. A. Linnell—you remember—must have been one of the fellows murdered in this Khartoum massacre.'

Dobbs glanced aside from his *Echo* and murmured in response: 'By Jove, so he must. He was out there, wasn't he? I'm sorry for him, poor fellow! A first-rate client! He must have been worth us four hundred a year.—And I say, Burchell, consols'll go down to some tune on this news too, won't they?'

'Fallen already,' his partner answered, consulting his tape and pursing his lips up. 'Stock exchange feels these pulses so instantaneously.—Look here,' and he rang the electric bell at his side: 'Brooks, will you bring Mr Linnell's box to me?'

The clerk brought it; and Mr Burchell opened it deliberately and glanced over the will. 'Aha!' he said, laying it down with some obvious unction. 'Precious lucky young woman, whoever she may be, Miss Psyche Dumaresq! Sounds like an actress: some casual love of his. Jolly glad she'd be this minute if only she knew the good luck in store for her. I thought I remembered it. Miss Psyche Dumaresq! Linnell's left her every blessed penny!'

'No!' Mr Dobbs replied, screwing up his mouth and laying down his *Echo*.

'Yes, every penny, to "Psyche, daughter of Haviland Dumaresq, Esquire, of Petherton!"'

'The family'll dispute it!' Mr Dobbs exclaimed, scenting prey upon the breeze and whetting his appetite.

'They can't!' his partner responded with cheerful certainty. 'There are none of them left. There's nobody to dispute with her. Sir Austen was the only relative Linnell had living; and Sir Austen was out at Khartoum along with him. Both of them had their throats cut at once, no doubt.—Precious lucky young woman, Miss Psyche Dumaresq.'

And all the time, Miss Psyche Dumaresq, unconscious of her luck, and most other circumstances, was sitting white as death in her chair at Petherton, with her open blue eyes staring blankly in front of her, and her dead numb hands hanging down like a corpse's.

'Shall you write and inform her,' Mr Dobbs asked, with his fat face screwed up, 'or wait for details and further confirmation? It's more business-like, of course, to wait for details; but promptitude often secures a new client. And eight thousand a year's not to be sneezed at.'

'No good,' Mr Burchell responded, still scanning the will and shaking his head. 'I have Linnell's own express instructions not to write to her about it till a year's elapsed.—Dumaresq—Dumaresq—let me see—Dumaresq. There's a fellow of the name writes sometimes, I think,

in the *Westminster* or the *Fortnightly*. His daughter, no doubt: perhaps she jilted him. And a precious lucky thing for Miss Psyche Dumaresq.'

THE BLUE-COAT SCHOOL.

ABOUT half-past twelve o'clock in the day there is generally a small crowd to be found in front of some railings in Newgate Street, gazing earnestly through at the Blue-coat boys at play. The Blue-coat boys! What dweller in London is not familiar with their odd though scarcely picturesque little figures? Dressed in their long blue coats, with a narrow leathern girdle round the waist, their knee-breeches, yellow stockings, and low shoes, they appear, but for their bare heads, almost exactly to-day as they did in the reign of Edward VI. We are so much accustomed to them, that the thought seldom strikes us how strangely out of keeping they and their school are with this nineteenth century of change and reform. Buried in the heart of the great city, Christ's Hospital has yet survived the destruction which has befallen so many similar institutions, and remains a dignified old-world building, lost in the midst of dingy streets and dingier shops and offices. How long it may still be left in peace is a matter of doubt. Already there are more than whispers that soon the love of reform and the greed of gain will drive the school from its ancient home into the country. Then the Hospital buildings will be swept away, and the funds of the school enriched with the rents obtained from their site.

Quite recently the building was threatened with destruction by a fire which broke out in one of the dormitories. The boys' brigade did good service in keeping down the flames until the arrival of the engines, and in a short time the fire was extinguished. This seemed like a beginning of the end—a warning of what was to come. So I determined to seize an early opportunity of visiting the quaint old place, before the power to do so was taken away from me for ever.

Standing in the playground and watching the boys careering madly around, I could not help wondering on what plea the destruction of the school could be accomplished. Others of the same kind have been doomed on the ground that their situation was unhealthy. But this excuse will not hold in the case of Christ's Hospital. The quadrangle which forms the playground is large and open, and the boys are as healthy and high-spirited as the heart of a parent could desire.

'It seems a pity,' I thought, 'that a place so interesting should disappear. This was the school of Charles Lamb and of Coleridge, and of many others with names as widely known. Its history is marked from its earliest beginning not only with the names of eminent men who here have learned and played in their boyhood, but also with those of kings, statesmen, writers, architects, who from time to time have given their assistance in adding to its glory.'

A bell ringing sharply recalled me from my historical reminiscences to the present. The bell was rung to summon certain of the boys to lay the cloth in the Hall for the one o'clock dinner. Soon after a second bell rang to warn all the

boys to wash their hands. This necessary operation several of the young scamps performed in an unauthorised manner at the pump in the playground, drying their hands on their pocket-handkerchiefs. Then a bugle-call sounded through the quadrangle, and soon the whole school was assembled under the eye of a drill-sergeant. At the word of command, they formed into little companies, the band struck up a stirring march, and the mimic army paraded round the playground. Each company had a small standard-bearer, who carried a very little flag with the number of the squad upon it. The band was a brass one, fully equipped down to the big drum, the musicians being all boys of the school; and very well they played, too, an occasional wheeze notwithstanding. Little boys acted the part of music-stands, and held themselves straight and stiff under the ordeal. But the moment they were released, off they went with a whoop and a slide.

It is well known that caps originally formed part of the Blue-coat boys' costumes. These were discarded about thirty years ago, though for what reason I could never ascertain. Often it had struck me that their bareheaded condition must be extremely dangerous in case of a hot sun; but as I watched them filing past into the Hall, this fear was effectually allayed. Such mats of hair were far too thick for any sun's rays to penetrate. Another peculiarity about the boys, very noticeable in these days of weak-eyed school-children, was the almost total absence of spectacles, and I wondered what could account for this.

Some of the boys wore badges like large white medals on their right or left shoulders. These are the mathematical, otherwise known as the 'King's boys,' because their side of the school was originally founded by Charles II. 'King's boys' are taught navigation, and are bound to go to sea when they leave school. As is the case in most old grammar schools, the main subject taught in Christ's Hospital is classics, hence the head boys of the school are called 'Grecians.'

When the boys were at last all assembled in the Hall, a beadle locked the door. A Grecian mounted the pulpit on the right-hand side of the room and read a fairly long grace. Then the door was unlocked, and babel commenced. The dining-hall was built in 1825, and is considered to be the second finest in London, second only to Westminster. At one end of it is an organ gallery, reached by a narrow crooked stair, which is open to visitors after grace has been said. From it a very good view of the curious scene can be obtained. The Hall is long, narrow, and lofty; and when somewhere near eight hundred boys are collected together in it, it will be easily understood that the sound which arises to the roof is no murmur. In spite of the numerous windows, the light is very dim, which increases the singularity of the scene. There are said to be several fine pictures in the Hall; but their faded colours together with the dim light rendered them almost indistinguishable from the gallery in which I stood.

No fewer than seventeen long trestle-tables were laid for the dinner. At the end of each stood a matron, whose duty it was to carve for and serve the boys around her board. Waiting

at table was done by a number of boys told off for the purpose. Monitors marched up and down between the tables the whole time to maintain some small amount of order, though their efforts were largely in vain. These poor creatures had to get their dinner when they could. Such is the price of honour! 'Laying the cloth' must be here a very simple matter, as all articles not absolutely necessary are dispensed with. The tables are covered with cloths more or less white, but generally less, and bearing marked traces of the kind of handling they receive. Three-pronged steel forks and black-handled knives are the only ones in vogue, and the place of tumblers is taken by white delf articles like mugs without handles. Food there is in plenty, and the waste of it by these thoughtless youngsters very great. Where bread is so plentiful, what does it matter if crusts are left uneaten, and crumb is employed in making neat little pellets with which to sting other boys' ears?

As a rule, the dinner consists of one course, so the meal is soon despatched. Then a scene of indescribable confusion follows. The boys swoop down upon the tables, and in the twinkling of an eye everything is cleared away. Small boys carry off the salt-cellars and water-mugs in baskets almost as large as themselves; the table-cloths are bundled up in a manner which would make an ordinary housemaid lift up her hands in horror; and the important process of clearing away is over. Out rush the boys helter-skelter; no forming into line and no marching this time.

During several Sundays in the year—that is, from Quinquagesima to Easter Sunday inclusive—what are called 'Suppings in public' are held in the Hall. On these occasions tickets of admission are issued to the public by the governors of the school. The supper consists of bread and cheese and beer, the cheese being placed in wooden bowls, and the beer drunk from wooden piggins. Visitors are not confined to the organ gallery, but walk between the tables, watching the boys at their food. This sight may be very interesting, but is it not also degrading for the boys in its close resemblance to the feeding-time in a menagerie?

The wards where the boys sleep are a curious sight with their rows on rows of little beds and almost total absence of any other furniture. I should not think extremely restive youngsters would manage very well with those beds, they seemed so very narrow. The boys make their own, which looked tidy enough, covered and tucked up all round with their blue coverlets. But I didn't inspect appearances below the counterpane. At the foot of the bed is a small box, in which the owner keeps his cakes and all those miscellaneous articles so dear to a boy's heart.

The Grecian of the ward is promoted to the dignity of a study, a little box of a place by no means big enough to swing a cat in. Here he sits enthroned in solitary grandeur, and keeps watch over the smaller fry in the ward, who get into mischief at the slightest opportunity. Each ward has its own linen room, and the sight of the piles of yellow stockings lying there awaiting repair is enough to make one shudder. The matron and her maid are responsible for the

darning and patching of the holes which somehow manage to come into all boys' garments. Think of doing all the mending for a family of about fifty boys, ranging from eight to fifteen years of age!

But the lavatory crowns all. It consists of a row of taps placed about two feet above the ground, and a trough into which the water runs. This is where the boys perform their morning ablutions, the only method they can adopt being to stoop and place their heads under the tap, letting the water run over them. A very primitive method of washing one's self, and a somewhat uncivilised one! Really, when I considered this thing, and indeed the extremely rough and uncouth method of living altogether, I could not but think that a change, if it brought about a reform in many of the domestic arrangements of the school, would not be entirely a matter of regret. It passed my comprehension how parents could voluntarily send their delicately-nurtured children to such a place.

'That may be all very fine,' possibly it is urged; 'but what can you expect in a charity school, where the children are taken almost from the streets? It is not in the least likely that the boys are accustomed to many elegances and luxuries at home, and so they won't miss them at school.'

This would be all very true if the Hospital had been kept to the original purpose for which it was instituted; but this is not at all the case. Presentations are in the hands of the governors, and what more natural than that they should misuse their power? Abuses crept in almost from the time of the founding of the school, and to-day the rich reap the benefit of the endowment as much as the poor, if not more. It is not right that such things should be.

At the present time the Hospital enjoys an income of about sixty thousand pounds, derived from various sources. Part of this sum is bestowed on boys leaving school in the form of exhibitions and scholarships to the universities and of apprentice fees.

Not the least of the objections, which can be urged against the manner in which the school has been conducted, is the small proportion of its benefits which is enjoyed by girls. Originally, as all old records show, boys and girls stood on an equal footing. Now, there are about one thousand boys on the foundation and only ninety girls. Such a contrast speaks for itself. A scheme, however, is, I believe, on foot whereby girls will be restored to something like their former position.

Apocryphal of the time when the Hospital was really and not nominally a school for boys and girls, a quaint story is told by Samuel Pepys, the well-known worthy of Charles II.'s day. In writing to a Mrs Steward, Pepys says: 'One thing there is indeed that comes in my way as a governor to hear of, which carries a little mirth with it, and indeed is very odd. Two wealthy citizens are lately dead, and left their estates, one to a Blue-coat boy, and the other to a Blue-coat girl, in Christ's Hospital. The extraordinariness of which has led some of the magistrates to carry it on to a match, which is ended in a public wedding; he in his habit of blue satin, led by two of the girls; and she in

blue, with an apron green, and petticoat yellow, all of sarsnet, led by two of the boys of the house, through Cheapside to Guildhall Chapel, where they were married by the Dean of St Paul's, she given by my Lord Mayor.'

Down in the quadrangle near the entrance is a little place which the boys call their 'tuck-shop.' This is presided over by a man who is privileged to sell sweets, &c. to the boys of the school. His father was a Blue-coat boy years ago.

Over the entrance-gate of the school stands a statue of Edward VI., who is generally accredited with being the founder of the Hospital. To the face of this image, time and weather, together with the original sculptor, have given an expression of smug and sanctimonious self-complacency, very grotesque, and somewhat suggestive of what boys would call a 'sneak.' How much longer will this funny little figure be permitted to preside over the fortunes of the old school? At present even the authorities do not seem to know. Great changes are, however, expected by all in the near future. Let us hope that, whatever they may be, the claims of the poor of both sexes will not be neglected.

MRS HARRINGTON'S DIAMOND NECKLACE.

By DENZIL VANE.

IN TWO CHAPTERS.—CHAP. I.

MRS HARRINGTON, of Harrington Hall, Grass-shire, should have known better, her friends told each other, than to throw a young, handsome, attractive, but penniless man, into company with a romantic girl of eighteen, who enjoyed the double privilege of being an heiress and a beauty. There was certainly no doubt about Gladys Harrington's claim to the latter title; she was tall, gracefully formed, elegant in all her movements, and she had the most radiant complexion, and the largest and softest brown eyes it is possible to imagine. As to her wealth, that also was beyond dispute. Though the Harrington estates were entailed on her half-brother, a boy of ten years old, the young lady would inherit, on attaining her majority, a fortune of forty thousand pounds; for Squire Harrington had been not only a large landed proprietor, but the owner of extensive collieries in the north of England.

Left a widow soon after the birth of her son, Mrs Harrington had lived a very retired life, devoting herself to the education of her children. Society in Grass-shire had for some years busied itself in discussing the probabilities as to the second marriage of the rich and still young widow. But now popular attention was turned to her step-daughter, Gladys; therefore, when it was noised about in the county that Mrs Harrington had been so imprudent as to engage a tutor under thirty years old to educate the heir of all the Harringtons, instead of selecting some learned graybeard or solemn-faced M.A. on the wrong side of fifty, popular opinion was all against her.

'I should think a woman with any knowledge of the world and of human nature would have foreseen the inevitable consequences of bringing such a man as Mr Ralph Cunningham into daily

association with an impulsive, unsophisticated girl like dear Gladys,' remarked Mrs Lamprey of St Kilda's Grange. She was the happy mother of six marriageable but unmarried daughters. Ill-natured people smiled, and whispered to each other that even a 'detrimental' such as Mr Ralph Cunningham would not have been an unacceptable suitor for the hand of any one of the Miss Lampreys, honest Squire Lamprey being a comparatively poor man, and his daughters neither pretty nor attractive. Besides, eligible young men were scarce in Grass-shire.

'Yes, and dear Gladys is so—so very unconventional,' added Mrs Smalman, the Rector's wife, to whom the remark recorded above was addressed. 'Perhaps it is the result of her singular bringing-up. She has lived too much alone, poor dear child; and her step-mother is not altogether the right sort of woman to have the care of a girl like Gladys. Mrs Harrington is so—so unsympathetic. Do you know, dear Mrs Lamprey, that sometimes I feel quite—quite uncomfortable when she looks at me with those curious bright gray eyes of hers?' finished the Rectoress with an affected little shiver.

And so the busybodies of the neighbourhood talked, while events at Harrington Hall were slowly ripening to the climax which every one declared to be inevitable. Gladys and her little brother's tutor saw a great deal of each other, for the heiress had a taste for English literature, and Ralph Cunningham was always ready to assist her in her studies. Together they read Keats and Shelley, Tennyson and Browning, and selections from Rossetti and Swinburne. Now, when two young people of suitable age and of equal personal attractions discover that their tastes are identical; when a young man of six-and-twenty and a charming girl of eighteen bend day after day over volumes of beautiful poetry; when the aforesaid young man has the delightful task of pointing out favourite passages in his favourite poems to an appreciative and intensely sympathetic listener who has glorious eyes and a divinely responsive smile, it is not difficult to guess that admiration will speedily blossom into love.

Before Mr Ralph Cunningham had been domiciled at Harrington Hall two months, the calamity predicted by the wiseheads of Grass-shire occurred. One day, when Ralph was initiating his charming pupil into the beauties of the 'Epipsychidion,' a glance was exchanged, a word or two was spoken, which changed the lives of both. Ralph, who was an honourable young fellow, had not intended to reveal his passion; but at six-and-twenty, one cannot be always on one's guard, and he had read something in Gladys' eyes which had, so to speak, drawn those daring words from his heart. Gladys, with the enthusiasm and carelessness of the future characteristic of eighteen, had gone at once to her step-mother and declared her intention of marrying Mr Ralph Cunningham.

Mrs Harrington, who, for some reason known only to herself, had taken a violent dislike to the tutor, was, however, wise enough not to make a scene. She did not order Mr Cunningham out of the house, or send Miss Gladys off in disgrace to school. She only darted one glance of contempt at the girl's glowing face, only folded her lips together in an expression that was not exactly

pleasant, and then gravely said: 'My dear Gladys, you are just eighteen, and Mr Ralph Cunningham is the only really agreeable man you have ever met. Do you think you will admire him as much ten years hence as you do now?'

'I shall never, never care for any other man. I will marry him or be an old maid,' cried Miss Gladys.

'Very well, my dear; you cannot marry without my consent for three years. I should fail in my duty if I gave it under the present circumstances. I do not approve of Mr Cunningham as a suitor for your hand. I believe him to be entirely unworthy of your affection. When you are of age, you can please yourself, and bestow yourself and your fortune on any adventurer or fortune-hunter you please.'

'Oh mamma, how dare you imply that Ralph is a fortune-hunter!' Here a sudden burst of passionate weeping followed; and Mrs Harrington, who hated scenes, calmly swept out of the room, leaving Gladys to brood indignantly over her words. There, an hour later, Ralph found her with flushed cheeks and eyes full of tears. He had very little difficulty in drawing from her all that had occurred.

'Gladys,' said Ralph gravely, 'I see but one course open to me. As a man of honour, I cannot remain here unless Mrs Harrington'—

'Oh Ralph, what is to become of me, shut up here alone with mamma! If you go, this house will be like a prison. I shall die of wretchedness.'

'Then, darling, marry me at once, and'—

'I cannot—at least not yet. When I am twenty-one I shall be my own mistress. Besides,' she added with one of her brightest smiles, 'I should forfeit my fortune if I married you now—and—and I want to give my money to you.'

The simplicity of her manner was in such strange contrast to the wisdom which seemed almost worldly, that Ralph was fairly dumfounded. Gladys, like most of her sex, was at once impulsive and timid, simple and cunning—a mass of contradictions, and yet was most lovable in spite of them all.

'You dear little wise woman,' cried Ralph, clasping her in his arms, 'I will be guided entirely by you. If you bid me stay here, I will stay. If you command it, I will wear my chain, and go on teaching Freddy his Latin grammar for three mortal years.'

'And bear mamma's frowns too?'

'So long as *you* smile, dearest, all other women in the world may frown and I shall smile.'

'That sounds almost like a quotation from one of our poets; is it?'

'No; it is all my own,' retorted Ralph with a laugh. 'Then,' he went on in a more serious tone, 'there is to be a sort of armed neutrality between Mrs Harrington and myself—unless she dismisses me,' he finished gloomily.

'She will not do that. Mamma is a very clever woman; she will not take any step which might drive me—to—to'—

'Marriage?' suggested Ralph.

Gladys nodded, and then laughed with such evident enjoyment and glee, that Ralph was once more puzzled by the strange complexity of this mere child's character.

And so matters went on at Harrington Hall

for several weeks. Mrs Harrington behaved with studied courtesy to the tutor, who, on his side, strove to look and act as if those momentous words had never been spoken between Gladys and her step-mother. To all appearance, he was only Freddy's paid instructor, and Miss Harrington's honorary Professor of Literature. The readings from the poets were continued; but master and pupil talked more than they read.

Sometimes, the curiously-still, malicious expression of Mrs Harrington's eyes as they met his across the breakfast or dinner table woke an indefinable dread in Ralph's breast. He had an uncomfortable feeling that Mrs Harrington would stick at nothing in order to sow dissension between him and Gladys. He dreaded he knew not what. It was like living on the slopes of a volcano; any moment a torrent of lava might overwhelm the fair seeming of their lives.

One night, on retiring to his own room, Ralph saw something on the carpet that startled him almost as much as the footprint on the sea-sand did Robinson Crusoe. It was only a tassel of jet and steel beads; but a cold shiver of apprehension stole over Ralph as he picked it up and placed it on the dressing-table. That evening at dinner Mrs Harrington had worn a black satin gown ornamented with precisely similar tassels.

'What could have been her motive in coming to my room?' thought the tutor. 'That she has done me the honour of paying me a domiciliary visit is, to my mind, conclusively proved by this small memento.' Here he picked up the bunch of beads and examined it meditatively. 'I daresay she has ransacked my possessions; but the question is—Why? Did she expect to find love-letters from Gladys? If so, I fear she was disappointed.'

For quite half an hour Ralph stood holding the tassel in his hand, ruminating on the extraordinary circumstance that had brought it into his possession; then suddenly bethinking himself that, as it was not yet eleven o'clock, he might get a letter or two written before going to bed, he went to the writing-table where stood his desk and opened it leisurely. 'I may as well put this out of sight,' he thought, smiling as he dropped the 'memento' in the pen-tray inside the desk. 'It would be rather good fun to return it to Mrs Harrington in the morning. I wonder what she would say?'

Having written his letters, he still felt disinclined for bed. Old habits of night-study still survived from his college days. There were half-a-dozen or so of his favourite volumes in his portmanteau; he determined to select one and read until he felt sleepy.

But in turning over the contents of the portmanteau he made a second discovery that startled him a good deal more than the former one—a discovery which brought out cold beads of perspiration on his forehead. His worst forebodings had been realised. Sleep was out of the question for that night, and Ralph spent the long hours until the day dawned in meditation that was neither agreeable nor profitable, for he had found out the motive of the strange domiciliary visit on the part of Gladys' handsome step-mother. But the discovery brought him new food for

thought, for it opened up a prospect that filled him with dismay.

At breakfast the next morning, both Mrs Harrington and Gladys seemed as calm and self-possessed as usual; they greeted the tutor with more than their customary graciousness, and though Ralph watched the elder lady narrowly, he could detect no change in that handsome impassive face of hers. 'What a grand actress the woman would have made!' he thought. 'Not the quiver of an eyelash betrays her!'

It needed a strong effort on his part to talk naturally during the progress of the meal, and once or twice he caught Gladys' eyes fixed inquiringly on him. He resolved to take her into his confidence, for he felt that it would be impossible to hide his secret from her; for the intuition of love had enabled her to find out that something troubled the man she loved.

'Woman's wit may find a way to baffle woman's wit,' he thought with a smile as he followed Gladys into the garden after breakfast. 'Wise mother, wiser daughter—to paraphrase the oft-quoted Latin line.'

Gladys' counsel seemed to dispel the cloud of anxiety and depression that had enveloped Ralph during the night. An hour later he passed into the study with a serene brow and devoted himself as usual to his tutorial duties.

The young master of Harrington Hall was a delicate and docile child, and Ralph, who had all a strong man's tenderness for those weaker, mentally or physically, than himself, always treated his gentle little pupil with a kindness that bordered on indulgence. And the boy had attached himself to Ralph with an affection so strong that his mother's jealousy had been aroused, and so fuel was added to the fire that had been lighted by Gladys' avowed preference for the penniless tutor.

'Promise that you will never leave me, Mr Cunningham,' said Freddy, suddenly looking up from his Latin grammar with a wistful look in his big brown eyes. 'I couldn't bear to learn of anybody else; and mamma says I needn't go to school until I grow big and strong like other boys.'

'What put that into your head, my boy?—I have no intention of leaving the Hall at present.'

'Oh, I don't know—only mamma said something that made me anxious,' replied the child, flushing up; 'and—and I had a horrid dream about you last night.'

'Come, my boy; surely you don't believe in dreams, you know the stuff they're made of—too many sweets and too much cake,' answered Ralph, trying to laugh.

But Freddy's little face was still grave, and a frightened expression came into his eyes. 'I dreamt about mamma too,' he whispered, looking round with a scared look, painful to see. 'I don't think mamma likes you, Mr Cunningham,' he added; 'and—and sometimes her eyes frighten me—even when—when she kisses me and holds me so tight in her arms.'

'I don't wonder,' thought the tutor as he remembered a certain cold, malicious glitter that sometimes lighted Mrs Harrington's fine eyes. But aloud he bade Freddy attend to his lessons and think no more of such an unimportant thing as a nightmare dream.

Tutor and pupil worked on steadily until nearly mid-day, when both received a most unexpected summons from Mrs Harrington's own maid, a tall, slender, and very quietly but elegantly dressed woman of about thirty-five, who had long been in service at the Hall.

'My mistress wishes to see you in the saloon, sir, and she bade me tell you to bring Master Harrington with you,' she said in her usual low and respectful tones.

'Certainly,' replied the tutor, rising with a smile.—'Come, Freddy.'

'The curtain is about to rise on the second act of the comedy,' he said to himself as he took the child's hand and followed the maid to the saloon, a large and splendid room, that served as an inner hall, and into which most of the rooms on the ground-floor opened. There he found not only Mrs Harrington and Gladys, but every man and woman who lived under the roof-tree of Harrington Hall.

'I see that Madame contemplates a *coup-dé-théâtre*,' he thought, rapidly exchanging glances with Gladys, who looked a trifle pale and anxious. 'The scene is well arranged; but I fear the "great situation" she contemplates will not make the effect she aims at.'

LACE AND ITS VARIETIES.

At the present time there is a strong tendency towards the artistic in all things connected with daily life. It is considered, and there is wisdom in the idea, that beauty added to an object does not detract from its usefulness, but rather increases it. Articles in every-day request do not serve their purpose less truly if they please the eye, and by grace of form and beauty of colouring educate the nature to find something of the artist's pleasure in the ordinary things which make the setting and framework of daily life. This strong artistic impulse has shown itself in some directions in a reaction in favour of mediæval types in articles both decorative and useful. Old china, ancient jewellery, antique furniture, are eagerly sought after; and old Lace, after having been consigned almost to complete oblivion, has once more reappeared out of the buried past, to delight an age which dotes on antiquity with its fragile filmy tissues.

The airy network of the spider's web may have first suggested to Barbara Utman, the wife of a German burgess, the idea of Pillow-lace, which was invented by her about the middle of the sixteenth century at St Annaberg, in Saxony, where she lived. It was at first called Bone-lace, from the bone-pins which were used to twist the thread round in forming the pattern; and becoming exceedingly popular, it soon spread into the Netherlands, and thence to France.

Long, however, before the date of Barbara Utman's discovery, the Flemish nuns in their convents near Ghent had discovered Point-lace; and in the end of the fourteenth and beginning of the fifteenth centuries, much of this beautiful and truly artistic lace was produced. This triumph of mediæval needlework was, however, scarcely so much an invention as a development of a separate inferior art called 'Lacis.' This was a variety of cut or drawn work, in which

a pattern was formed by drawing out threads from a loose coarse fabric, and then fastening the loosened threads together with a needle. Many books of patterns for laces and needle-point are still in existence, spreading over the whole of the sixteenth century. Of these the most ancient is the German Model-Buch, which bears the date of 1521. Vinciolo, a Venetian, also published a book upon lace in 1592, in which the transition from laces to needle-point is very clearly shown. His patterns are exceedingly complex and beautiful; and Venice, his native city, soon became famous for a peculiar variety of point-lace called Point de Venice, a rose or raised point which supplied a favourite material for the large ruffs then in fashion. Point de Venice continued to be the favourite wear of the fops and dandies of the period until Colbert introduced the manufacture of point-lace into France in the reign of Louis XIV., when Point d'Alençon very soon equalled, and then surpassed its far-famed Italian rival.

Lace having been once introduced into France, became extremely popular there, and was profusely worn at the magnificent court of Louis XIV. Even at the duels which were then so frequent, it was considered in the best taste to appear upon the field of combat in a shirt elaborately trimmed with rose-point, or Point d'Alençon. Vast collections of this beautiful and costly material were to be found not only in the convents, but also in the families of the nobility. The Marquis of Cinquars, one of the most worthless of the favourites of Louis XIV., left behind him not only an unrivalled selection of lace ruffs, collars, and cuffs, but also three hundred pairs of long boots trimmed round the top with ruffles of rose-point.

The reign of the Grand Monarque was emphatically the golden age of lace in France. In 1679 the king gave a fête at Marly, and in order to encourage the new manufacture, gave orders that each lady of the court on retiring to her room to change her dress should find placed ready for her use a costly toilet of lace. The portraits of the fine ladies of the period appear covered with it; it shades the worn pensive features of the neglected wife of Louis's youth, and softens the stately severe beauty of the uncrowned wife of his age. Madame Maintenon was partial to it, and the needles of the little maidens at St Cyr were kept busy upon its beautiful filmy webs.

Nor was the taste for lace confined to women only; men in that lace-loving age were quite as much its votaries as the softer sex; and one famous cravat, the Steinkirk, which was profusely trimmed with lace, owed its name to the famous battle in which Marshal Luxembourg defeated William of Orange.

The patroness of the Scotsman Law, brusque, honest Madame Palatine, the mother of the Regent Orleans, was a great lover of lace, and when in a more than usually good humour, often made a present of a set of Point d'Alençon or Venetian Point to one or other of her ladies of honour. Lace was so much the universal rage in those days that even clergymen decked themselves out in it. Fénelon, the pious Archbishop of Cambrai, had four dozen pairs of costly ruffles; and even the public executioner—Monsieur de

Paris, as he was called—when he ascended the scaffold in pursuance of his vocation had a point-lace breast frill, and ruffles falling over his velvet suit.

Coverlets for beds were made in Venice Point, all in one piece, and sometimes cost with the trimmings of the sheets as much as four or five thousand crowns. So great was the rage for linen trimmed with lace, that the trousseau of a daughter of one of the *ancienne noblesse* sometimes cost as much as one hundred thousand crowns; and five thousand crowns worth of lace and linen was quite an ordinary outfit.

With the reign of Louis XIV. this profuse extravagance in lace came to an end in France, although it still held its ground to a certain extent during the two subsequent reigns. Marie Antoinette cared little about lace; she preferred India muslin; but her husband, Louis XVI., was fond of it; and the year before he perished on the guillotine, owned fifty-nine pairs of ruffles of Point and Valenciennes lace.

The Revolution suspended for a time the manufacture of all kinds of lace in France, and extinguished for ever the production of Point d'Argentin. Point d'Alençon was more fortunate, and revived under the fostering care of Napoleon. Josephine was fond of it; and the Duchesse d'Abrantes in her *Memoirs* gives in amusing detail an account of her trousseau, in which she revels in glowing descriptions of the finest lace.

Louis Napoleon, following the example of his uncle, bestowed much attention on the lace-manufacture of Alençon, which had found a dangerous rival in Brussels Point. Point d'Alençon is one of the most beautiful point laces of modern times; it is made solely by the hand with a fine needle upon parchment patterns, which are coloured green as being a good tint for the eyes. It is worked in pieces ten inches long, which are afterwards united by a skilful worker.

Bobbin or pillow lace, Barbara Utman's invention very much improved, was made on a revolving cylinder with a cushion, on which the pattern was pricked out with pins, round which the worker twisted the thread. This lace was early carried to great perfection in Flanders and Brabant. Nothing could be more beautiful than those old pillow Flemish laces, and they were very popular in France, where they were known as Point d'Angleterre, coming by this English name, to which they had no title, because they were first smuggled from Flanders to England and then resmuggled into France.

The best Brussels lace is made in the city of that name; and of late years the manufacturers there have set themselves very successfully to imitate Point d'Alençon. The lace they make is at a little distance exactly like its French rival, and costs a very great deal less. The best Brussels Point made by the hand costs about six pounds per yard, while a yard of Point d'Alençon of the same width costs about fifteen. On a close inspection, it must be confessed that the French lace has the advantage of greater fineness and a more careful finish; but in elegance of design and in the wonderful perfection of the raised flowers and figures, the Belgian lace is equal if not superior to its far-famed rival.

Little Flemish girls begin at the age of seven

to learn the art of lace-making; and a great deal of very fine lace is still made by the nuns in the Belgian convents. The lace is made in small pieces, which are distributed among many workers, and these when finished are joined together by skilful hands. Other Brussels laces are partly point and partly pillow laces, such as the Point de Medici, the Point de Flandre, the Point Duchesse, and the Point de Paris.

The flax from which the exquisitely fine thread is spun which is used in the manufacture of lace is largely grown in Brabant, St Nicholas, Tournay, and Cambrai. It is almost all steeped at Courtrai, on account of the superior clearness of the waters of the Lys; and the thread of the finest quality is spun underground in partially darkened rooms, or rather cellars, because the dry air above is apt to cause it to snap. It is so extremely fine that it is felt rather than seen, and the spinner as she works in the semi-gloom closely examines the thread from time to time, and stops her wheel if she perceives the slightest inequality in it. Drearier, more unwholesome work it is difficult to imagine. The damp dark cellars are so arranged that only a single powerful ray of light shall fall upon the wheels. Health and eyesight speedily fail; the hands, perpetually numbed with cold, are soon crippled with rheumatism; and premature old age attacks the worker before youth itself is past. But the wages are high, and the ranks of these Flemish thread-spinners are always full.

The ground of Flemish lace was formerly made either by hand or on the pillow. The hand-made ground was very much more expensive than the other; but it was much stronger and more durable, and could easily be repaired without showing the join. Now the ground of Brussels lace is very generally machine-made; and it is only on special occasions, such as the preparation of a royal *trousseau*, that the hand-made ground is resorted to.

The city of Malines or Mechlin is, or rather was, at one time as famous almost as Brussels for a lace of its own, less rich and heavy, but wonderfully effective and elegant. In the reigns of Mary and Anne this lace was very fashionable in England; and it continued in favour during the reign of George I., who was fond of wearing a Mechlin cravat.

Somewhat similar to Mechlin was the beautiful and durable pillow lace known as Valenciennes. In the early part of the last century this was peculiarly a French manufacture, and many thousands of people were employed in the lace-trade of Valenciennes; but it was extinguished by the Revolution, or rather it was transferred from France to Belgium, where it still flourishes. Valenciennes is a very durable lace, and owing to this quality, immense quantities of it are often handed down as heirlooms in great families. It was, in the days of its glory, a very costly lace, the quantity necessary for a lady's head-dress often costing, according to breadth and quality, from a hundred to a thousand guineas. It required a very long time to make; to produce a pair of ruffles took a woman who was a good worker ten months, working fifteen hours a day; and it was, besides, so prejudicial to the eyesight, that no lace-maker could work at it beyond the age of thirty. The laces of Lille,

Arras, and Bailleul were similar to Valenciennes, but were neither so fine nor so elaborate, and cost much less.

In England, lace has long been made in the counties of Bedford, Buckingham, and Northampton. In Bedfordshire there is a tradition that the manufacture of lace was introduced into the county by Catharine of Aragon, who brought the art from Spain. In the reign of Charles II. Flemish lace-makers came over and settled in England; but they could not obtain flax of the requisite quality from which to spin the exquisitely fine thread required, and the lace they produced was very much inferior to the Flanders lace. Devonshire also became famous as a lace-making county, and its Honiton lace is unquestionably the best that has ever been made in England, although it is only equal to a second or third rate Brussels lace. The old Honiton ground, which was made on the pillow, went out of fashion when bobbin-net was invented, and is now superseded by modern guipure, on which the Honiton sprigs are sewed.

The Devonshire lace-workers were, unfortunately for themselves, old-fashioned and prejudiced. For a long time they clung obstinately to heavy clumsy patterns, which had been in date from the infancy of the art; but now a spirit of progress has taken possession of them, and they have obtained from the authorities of South Kensington a number of beautiful designs. The discovery of bobbin-net, which annually consumes a large quantity of Scotch cotton thread, produced a great change in the history of lace; and shortly afterwards a still greater revolution was caused by the adaptation of the Jacquard loom to lace-making, a manufacture which was speedily introduced into Nottingham on a large scale. Some of these machine-made laces imitate most faithfully the costliest needle-point and pillow-lace, and the better classes of them have portions of the work executed by the hand.

Lace head-dresses, or what were called heads of lace, were very fashionable in England in the reigns of Mary and Anne, and the ladies of the court sometimes paid very large sums for a fine head of French or Flemish lace; but the extravagance in this fragile article of luxury was never carried to the same ruinous extent as in France. It was, however, profusely worn during what may be called the lace epoch, and was even coveted as an article of adornment after death. Mrs Oldfield, the celebrated actress, left instructions that she should be laid in her coffin arrayed in a very fine head-dress of Brussels lace, in a shroud of Holland linen with lace tucker and ruffles, and a pair of kid gloves. Yards of the costliest Point d'Angleterre and Mechlin laces were wrapped around the corpse of the beautiful Aurora von Konigsmark before she was laid in her grave at Quedlinburg; and many of the mummies found in the catacombs of the Capuchin convent at Palermo are swathed in the same costly funeral robes.

Dr Johnson disliked lace; and shortly after his epoch, although owing to no influence of his, but rather to the tyranny of Fashion, lace almost ceased to be worn or valued in England; till in course of time laces of great value were so slightly esteemed that they were considered little better than so much valueless rubbish. Mrs

Bury Palliser tells a story of a lady who had some very fine old lace which she bequeathed to some young-lady friends; but on the legatees going to take possession of the bequest, they found only new lace, and asked the maid of the deceased, an old Scotchwoman, where the old lace was. 'I'se warrant it's a' there,' was the reply of this sagacious abigail, 'barring a wheen auld black ragged duds that I flung on the fire.'

Another lady's-maid, a painstaking and cleanly soul, ashamed to present to its new possessor a coffee-coloured but priceless legacy of rare old lace, sewed it together and put it into a strong soap-lye to simmer all night on the fire. In the morning she was surprised and dismayed to find that it was reduced to a jelly.

So low did lace fall, that many old ladies still alive remember dressing out their dolls in fragments of costly Point d'Alençon and other equally rare laces; while many specimens of old point were preserved from destruction only by being locked up in the cabinets of those to whom all relics of antiquity were dear. Lady Blessington was a famous collector of this sort, and left at her death a very large accumulation of valuable old lace. Lady Morgan and Lady Stepney were also noted lace-collectors, and often quarrelled over the merits of their respective hoards. Nowadays, the subject of lace-collecting is better understood: the laces are arranged in careful order; and magnificent collections of the best examples of every kind of lace have been formed. And what is of more interest to the manufacturers of the article is, that Fashion, so fathomless and irresponsible in its caprices, has again smiled upon lace; although lace of the rich heavy quality which Van Dyck delighted to paint and the Venetian beauties loved to wear, has not yet reappeared, and perhaps never will.

HABITS OF AND LEGENDS ABOUT STORKS.

ONE of the things that we looked forward to with the greatest eagerness on our first visit to Holland was seeing a stork's nest. Our disappointment on finding that there was not one on any of the houses at the Hague was bitter. The love of tidiness has at last conquered the universal affection that the Dutch, in common with so many other nations, have for these birds, and the nests in the towns have become rare. Still, the birds are carefully protected, and many breed every year in the country districts. A pair come every spring to the little Zoo at the Hague and nest in a small tree overhanging one of the ponds. We did not discover where the two that generally frequented the fish-market nested. These were the tamest birds we ever saw. The market was small and crowded; but the birds stalked gravely about among the fisherwomen from Scheveningen in a quiet dignified way. They never tried to steal any of the fish, but contented themselves with the numerous scraps which the fisherwomen threw them.

No bird has been so widely respected as the stork in the past; and to none in the present is such careful protection afforded. From Algeria to Denmark, from Spain to Russia, storks are

honoured and loved. In France alone, of all countries in which they breed, have they been persecuted. The provinces of Alsace and Lorraine formed an exception: the German population here were always true to the national feeling for the birds.

The ancient Egyptians extended to storks the reverence with which they regarded so many creatures. This has been attributed to the great use of the birds in destroying snakes; but we think it is very doubtful whether this had any real weight. Men sometimes, though not often in England, have legislated for the protection of wild creatures whose part in the scheme of Nature they saw was beneficial to themselves; but it requires something more to inspire that feeling of reverence and love which has from the earliest times been felt for the stork.

Even if utilitarian motives influenced the Egyptians, the Teutonic races must have had other reasons; for poisonous snakes have never been common in Central Europe. Storks have represented to them that permanent family life which has been the basis of all their early social polity and morality.

Affection and respect due from man to wife, industry and self-devotion from parents to children, and intense attachment to their home, have in all ages characterised the German race. All this they saw exemplified in the stork. True, had they searched for them in other creatures, they would have found many other such instances; but the 'piety'—to use the word in its Latin sense—of the storks was before their eyes. The birds, by nature bold and confiding, preferred building their huge nests in the neighbourhood of dwellings, and their confidence was rarely misplaced.

Perhaps the fact that the stork was one of the first harbingers of spring led to the earliest liking for them. Messrs Erckmann-Chatrian, in their '*Contes des Bords du Rhin*,' give a striking picture of the excitement in the village when the storks appear. The old man who comes in hurriedly to announce their arrival—the crowd under the church tower on the top of which the bird has settled—the old woman thanking '*le bon Dieu*' that He has allowed them again to see the return of spring, are vividly described.

In Holland, Denmark, and Germany, numerous legends and superstitions have gradually arisen concerning the storks. The best known is that it is they that bring the babies—probably a story told so often to children, that at last it was believed by their elders to be part of the good luck that a stork's nest near a house will bring. Grimm's and Hans Andersen's fairy tales include many in which the bird plays a part. 'They are good tenants,' say the Schleswick farmers, 'and pay their rent every year; sometimes an egg, sometimes a young bird.' This refers to the way in which not unfrequently an egg or young one falls from the nest—probably from pure accident, for the birds are devoted parents; but the country-people have considered it as an acknowledgment of their being but yearly tenants.

They arrive in Holland about the 1st of March, and in Denmark almost as soon. In Poland, where they are common, the first come about the 20th of March, the male birds preceding their mates by a few days. The same nests are used

for an immense number of years; and each season the birds add to the pile, until the owner of the house, if they build on one, is obliged to remove a considerable part of it, for fear of the roof giving way. The birds either live for a great age, or else have something approaching to a law of succession, for the same nest is often tenanted every year for a great length of time. We heard of one in North Holland which had never, in the memory of any one on the estate, been without a tenant, yet only that one pair nested in the village. As the male bird comes first and takes possession of the nest, it seems as if the same bird must have returned for at least sixty years; yet could any bird of passage live to such an age?

Sparrows and wrens not unfrequently build in the stork's huge pile of sticks, a nest within a nest, which we rarely see in England. In Holland and Denmark a common mode of inducing storks to take up their abode is to fasten a cart-wheel on the top of a tall pole erected in some field. At the village of Luitsedam, near the Hague, there is one of these, which is regularly tenanted. Closer to the town, in the plantations round the house of one of the gentry, there is an enormous nest. It is placed at the top of a large silver fir, the leading shoot of which has been broken by the wind. At Wassenaar, a village some miles off, where immense quantities of bulbs are grown, a pair yearly rear their young ones on the church tower.

The story of the bird that perished in the great fire at Delft rather than desert her unfledged young, is well known. The storks that continued to feed their nestlings through the fearful bombardment of Strassburg in the late Franco-German War also deserve a place in history. There are two pictures, photographs from which we saw when at Strassburg, of the nest before and after the Prussian shells had poured into the town. It was placed on a large chimney-stack on one of the highest houses. The first picture shows the four young ones comfortably seated in it, one old bird standing close by while her mate is flying down with his crop heavy with the results of his fishing. In the second picture the roof of the house has been pierced by shells; an entire house close by has been burnt out, half the chimney-stack destroyed, and the nest is hanging down in a perilous manner. One of the young birds has perished; but the shells have spared the remaining three, and the parent birds are still at their post.

The birds often assemble in large flocks at the end of August, before commencing their southward migration. On the 20th of August 1880 we saw one of these flocks in the great meadows by the Elbe near Wittenberg. Sometimes they hold at these assemblies what the Germans call a 'Storchgericht,' a trial and execution of one of their body. Mr Dresser, who had the good fortune to see one of these curious meetings in Holstein, is of opinion that the unfortunate bird then killed was a weak or injured one which could not accompany the main body in their migration, and was therefore 'extinguished.'

Dutch, Germans, and Danes all ascribe these executions to some offence given to her mate by the female stork. Numerous stories are told of the offended husband collecting his friends and killing, with their help, the guilty wife. On one occasion when a goose's eggs had been sub-

stituted for the stork's, the female and young goslings were, it is said, killed by a flock of storks that the male bird had summoned. Probably the whole story is pure invention, for a pair have been known to hatch and rear the young of the black stork, whose eggs had been substituted for their own.

It must have been the Dutch who first asserted that storks would never nest except in republics and free countries. 'But this,' says Willughby, writing in 1676, 'we found by experience to be false, having observed them in the territories of some Princes in Germany.' Great numbers breed in the Dobrudscha and Turkey, where Turks, Bulgars, and Greeks unite in protecting them. In Thessaly they have been venerated from the earliest times, for Pliny says that to kill one there was a capital offence; the life of a stork was worth as much as that of a man. He adds that this was due to their use in killing snakes; but Pliny's facts are far more trustworthy than his theories, though even the facts are not always to be relied on.

Storks never seem to have been common in Italy. Apparently the two great routes of migration are by Spain and North Africa; or Turkey, Asia Minor, and Palestine, and though a few travel over Italy, none stay there to nest.

There are very few allusions to them in Latin authors; but one of these is interesting. The birds have a curious custom of snapping their bills, making quite a sharp noise. Young and old birds, both during and after the breeding season, constantly do this. In the writings of Persius there is a reference to this habit. 'There are,' he says, 'three favourite ways of deriding a man—by putting the hands beside the head like asses' ears; by putting out the tongue like a dog; and snapping the fingers against the palm of the hand like a stork's bill.' The first two methods of mockery are plain; but what was the cause of the last?

The regularity of their migrations furnished Jeremiah with a rebuke against the Jews: 'The stork in the heaven knoweth her appointed time,' &c. Canon Tristram, when in Palestine, saw thousands moving slowly northward. 'They were scattered,' he says, 'over hill and valley, moving a few miles a day—not in flocks, but singly or in small groups.' Few stay there for the breeding season, and these are never molested. Its Hebrew name, Chasedah, signifies pity or mercy, and is probably derived from the affection which the stork has for its young.

The eggs are from three to five in number, and both birds share in incubation, though the female is the usual occupant of the nest.

England is beyond the ordinary range of the stork, though hardly a year passes without one or two being seen on the east coast, and generally, alas! shot. Unlike the bittern and ruff, it was no more common before the fens and swamps of Cambridge and Lincolnshire were drained than it is at the present day. 'Mine honoured friend, Sir Thomas Brown of Norwich,' wrote Willughby, two hundred years ago, 'says that it is but rarely seen on our coasts.' There is, we believe, no record of its nesting in England; and the impossibility of protecting a migratory bird precludes the hope of its being introduced into the country.

But while there is no known record of storks having ever nested in England, it is not improbable that they occasionally did so, from the fact that they at one time nested as far north as the capital of Scotland. Bower, an ancient Scottish chronicler who resided near Edinburgh, states that in the year 1416, storks came and nested on the roof of St Giles' Church, in the High Street of that city. They remained a year, he says, and departed to return no more; and 'whither they flew no man knoweth.'

Apart from the interest attaching to the stork, it is a remarkably picturesque bird; its snowy body contrasting with the bright red beak and legs and black quill feathers of the wings, make it a striking object. The flight is magnificent, bolder and more buoyant than that of a heron. Like most large birds, its powers of flight show best when it is at a great height. When we were on the Bastei rock, in Saxon Switzerland, a pair passed overhead, flying southward. Though high above us, we could clearly see the black pinion feathers; and as we watched the powerful beat of the wide-spreading wings, we thought of the angels in Zechariah's vision who had 'wings like the stork.'

VERS DE SOCIÉTÉ.

SOCIETY Verses are for the main part minikin and dainty little poems, lightly dwelling on the whims, affectations, and caprices of the passing hour. Love forms the theme of many of these little poems; but love is in the background, and propriety and courtesy are always to the fore. The writer of Vers de Société is delicately ironical; his scorn is but the petulance of a graceful humming-bird. His playfulness is oftentimes tender, and its subtlety gives the greater effect to his light and airy satire. The world he lives in is a world composed of fragile china shepherds and shepherdesses; he must needs be delicate in his treatment of them, or, by one false step, he will demolish a whole group of his pretty models. Above all, the writer of society verse must let no sorrow or sadness creep into his verses. His first object should be to please and to divert; he will hide a tear as he rattles his cap and bells; or, by an artfully wrought conceit, disguise, and possibly conceal from the view altogether, the more grave and serious side of things. The side he shows us of the medal is the bright side; he may himself see the reverse, but it is his business to present the best face.

It must not be at all supposed that because this kind of verse is fanciful and *légère* that it is by any means the easiest of construction. There is certainly no great thought or mighty image to be found in these verselets; they differ from sonnets in this respect. A sonnet has been described as 'an epic in fourteen lines'; and it is an indication of the feeling of the times that sonnet-writing is giving place to society verse. Sonnets are governed by hard and fast rules, and the muse is fettered in shackles of iron; but in society verse this is perhaps even more so, and the verses are polished and repolished till they become dainty and fastidious. They must sparkle with a well-restrained wit, and must never

approach in the slightest way hearty mirth and rollicking fun. To raise the loud boisterous laugh by his buffoonery—that is the business of the parodist; but the writer of society verse must not be clad as a harlequin at a pantomime; he must be elegantly attired in court dress, with silken hose and prettily-pointed shoes; and his delicate white hands, with their slender fingers and rosy nails, must taper like those of a courtly lady.

The humour of vers de société must be quaint in its conceit. The author of pretty rondeaus and ringing villanelles may perhaps see gross abuses in the very heart of society; he may see rank weeds and poisonous flowers growing here and there in the very midst of the Eden of the fashionable world; but he will only give his readers glimpses for one instant of these evils, and his satire must be elegant, graceful, and delicate. He can only administer his criticisms in homeopathic doses; his productions must not be reflective, but crisp and sparkling. Vers de société, according to the definition of Mr Frederick Locker, no mean authority, should be 'short, elegant, refined, and fanciful, not seldom distinguished by chastened sentiment, and often playful. The tone should not be pitched high; it should be idiomatic, and rather in the conversational key; the rhythm should be bright and sparkling, and the rhyme frequent and never forced; while the entire poem should be marked by tasteful moderation, high finish, and completeness.'

Although vers de société is in its purest forms only an adaptation from the French, who have since the troubadours and the days of Villon excelled in the light and fantastic style of versification, Herrick and Waller and Sir John Suckling have left us many specimens of fanciful English society verse; but we must come down to writers only recently dead to find modern specimens of this school, such as Præd and Tom Hood and Thackeray, though these are not strict in their adherence to the French forms. Living writers afford the best specimens of this new English school of verse, and among the foremost ranks are such names as Andrew Lang, Austin Dobson, Edmund Gosse, and Dr Macdonald. As a specimen of the vers de société spirit, the following, from the facile pen of Mr Henry S. Leigh, is worthy of quotation:

THE TWO AGES.

Folks were happy as days were long
In the old Arcadian times;
When life seemed only a dance and song
In the sweetest of all sweet climes.
Our world grows bigger, and, stage by stage,
As the pitiless years have rolled,
We've quite forgotten the Golden Age
And come to the Age of Gold.

Time went by in a sheepish way
Upon Thessaly's plains of yore.
In the nineteenth century, lambs at play
Mean mutton, and nothing more.
Our swains at present are far too sage
To live as one lived of old:
So they couple the *crook* of the Golden Age
With a *hook* in the Age of Gold.

From Corydon's reed the mountains round
Heard news of his latest flame;
And Tityrus made the woods resound
With echoes of Daphne's name.

They kindly left us a lasting gauge
Of their musical art, we're told ;
And the Pandean pipe of the Golden Age
Brings mirth to the Age of Gold.

Dwellers in huts and in marble halls—
From shepherdess up to queen—
Cared little for bonnets and less for shawls,
And nothing for crinoline.
But now simplicity's *not* the rage,
And it's funny to think how cold
The dress they wore in the Golden Age
Would seem in the Age of Gold.

Electric telegraphs, printing, gas,
Tobacco, balloons, and steam,
Are little events that have come to pass
Since the days of the old *régime*.
And, spite of Lemprière's dazzling page,
I'd give—though it might seem bold—
A hundred years of the Golden Age
For a year of the Age of Gold.

Some of the best examples of this æsthetic school of verse may be found in Austin Dobson's *Vignettes in Rhyme*, and Andrew Lang's *Rhymes à la Mode* and *Ballades in Blue China*. We cannot forbear from quoting a charming one from this latter book :

There's a joy without canker or cark,
There's a pleasure eternally new—
'Tis to gaze on the glaze and the mark
Of china that's old, and that's blue ;
Who'd have thought they would come to us, who
That o'er loot of an empire would hang
A veil of Morrisian hue,
In the reign of the Emperor Hwang ?

These dragons—their tails you remark,
Into bunches of lotus flowers grew—
When Noah came out of the Ark,
Did *these* lie in wait for his crew ?
They snorted, they snapped, and they slew,
They were mighty of fin and of fang,
And their portraits Celestials drew,
In the reign of the Emperor Hwang.

Here's a pot with a house in a park,
In a park where the peach-blossoms blew,
Where the lovers eloped in the dark,
Lived, died, and were turned into two
Bright birds that eternally flew
Through the boughs of the May, as they sang ;
'Tis a tale was undoubtedly true
In the reign of the Emperor Hwang.

ENVOY.

Come, snarl at my ecstasies, do,
Kind critic, your tongue has a tang,
But a sage never heeded a shrew
In the reign of the Emperor Hwang.

The following elegant and charming *morceau de poésie* is from the pen of Austin Dobson :

Oh ! Love's but a dance,
Where Time plays the fiddle !
See the couples advance—
Oh ! Love's but a dance !
A whisper, a glance—
'Shall we twirl down the middle ?'
Oh ! Love's but a dance,
Where Time plays the fiddle !

Though only eight lines in its entirety, and one of those lines occurring three times, and another one twice, yet in spite of its artificiality, in spite of its limited space it manages to convey to the mind a flash of a pretty picture even if only for an instant. It will be noticed with what grace

and subtleness the conversational is introduced in the sixth line.

A most finished poem, and rising to a very high level above the average standard of these pretty lilting rhymes, is that entitled *Expectation*, by Edmund Gosse :

When flower-time comes and all the woods are gay,
When linnets chirrup and the soft winds blow,
Adown the winding river I will row,
And watch the merry maidens tossing hay,
And troops of children shouting in their play,
And with thin oars flout the fallen snow
Of heavy hawthorn blossoms as I go :
And shall I see my love at fall of day
When flower-time comes ?

Ah, yes ! for by the border of the stream
She binds red roses to a trim alcove,
And I shall fade into her summer dream
Of musing upon love—nay, even seem
To be myself the very god of love,
When flower-time comes !

Is not this a complete summer dream in verse ? We can fancy as the lines run on that we are listening to the soft plashing of the river stream against its tufted banks ; we can see the poppies in rich patches amidst the waving corn ; and we can smell the delicious fragrance of the new-mown hay as it is wafted on the gentle breeze that bears to us in fitful lullabies the song of the light-hearted mowers.

Vers de société, although it has much in it to commend it, lacks earnestness, and it is this lack of earnestness, this mere conforming to conventional forms, and dealing only with fleeting topics, that will give to it no great duration. Its superficiality is a sure sign of its short-livedness. Alas ! the pretty poems that have served to divert us during the long winter days of this life will be put on the shelf when we have passed into the great land of sunshine, and our great-grand-children will regard them much as we regard the curious old-fashioned china shepherds and shepherdesses ; and new songs will be sung then, the old old tale of love will still be told, but new eyes will brighten to hear it, and the telling will be ever fresh.

MOONLIGHT ON THE LAKE.

In the autumnal gloaming sad and chill
The moorland mere in silent slumber lay,
Unruffled were its waters, darkly gray,
And all its sentinel reeds stood stiff and still ;
The peewit's last good-night fell clear and shrill,
The west was dusky-brown with dying day,
When came across the heather, far away,
The gleam of moonrise o'er the distant hill.

Like flame that flashes through the cannon-smoke
A full moon climbed above the swaying firs—
The rushes felt that herald-breeze of hers ;
They whispered to the water that awoke,
Athwart its face a golden ripple broke,
And the Queen kissed her nightly worshippers.

THE EXPLOSION AT ROME.

BY ADA M. TROTTER.

WE were roused at a few minutes past seven on the morning of April 23d by a sensation akin to earthquake. The house rocked and shook from the foundations; windows and doors were burst open; and a few moments later, a terrific explosion took place, which drew us all to the window, for the sound of glass falling and smashing in every direction led us to imagine a bomb had exploded at our very doors. But our first glance showed us that the scene of disaster was at some distance from us, for over the Quirinal Palace a dense column of smoke arose, assuming the form of a gigantic pine-tree, afterwards wind-driven to St Peter's, where it obscured the mighty dome from our view. As the crowd saw the position of the cloud, one thought seems to have dominated all hearts—fear for the safety of the King. That the explosion could have taken place at a distance did not occur to any one who had just experienced the severe shock with its accompanying roar.

When we had ascertained that no bomb endangered our lives at our doors, we had time to notice the scene around us with no little appreciation of its unique quality. People in all stages of toilet leaned from the open windows; while others, dressed or only half-clothed, rushed about the streets, gesticulating, calling, shrieking, and gabbling wildly. No one knew more than his neighbours; but then the sensations felt by all at this live moment were so extraordinary, that none could be silent; so every one talked, and naturally no one listened. The servants in our house ran about the corridors, almost in convulsions with terror, praying, imploring protection from the Madonnas which they clasped to their breasts. For the moment it was bedlam within doors and out. The papers afterwards gave graphic accounts of the heart of Rome at this moment. Streets were black with a mass of people, men, women, and children, in every stage

of deshabelle, directing their steps towards the Quirinal, fearing to find the palace a ruin.

Meantime, the King, who was dressing when the shock came, rushed out in his shirt sleeves, got a cab (report says), and dashed off towards the Porta Portese, divining at once what had happened. He was there by half-past seven, so it will be seen that he must have gone at full speed—in fact, he was one of the first to arrive upon the spot.

The crowd finding at last the true cause of the shock, now struggled to make a way to the gate, a 'motley crowd'—civilians, soldiers, firemen, monks, Sisters of Charity, beggars, workmen, and ladies and gentlemen of all nationalities. It was a sight, perhaps, to be seen only once in a lifetime, this human mass, pouring out of Rome towards the scene of disaster. Arrived there, we find the King the central figure, encouraging the wounded, organising workmen, and when a woman's form was seen beneath the ruins, even tearing away the débris with his own hands in the excitement of the moment. He drew near to the heart of his people this bright April morning, utterly forgetful of self, unconscious of fatigue, moved to tears by the suffering of the brave soldiers, King only by virtue of his power to lead on this terrible field of battle.

The Powder Magazine—which contained two hundred and sixty-five tons of powder, without counting an enormous amount of shells, bombs, cartridges, and other explosives—was situated about a mile and a half beyond the Porta Portese. Now that the accident has happened, the question arises naturally enough, 'Why was such a large quantity of combustible material permitted so near to the city?' To most this question now is to 'shut the door when the steed is stolen,' says an Italian paper.

The inquiry into the cause of the disaster is not yet made at the time I write. The impression given by the leading papers seems to be that it was an accident, not as some thought at first, deliberate design of anarchists. The most credible account—from the *Roman Times*—runs,

that the magazine had been opened the previous day in order to air the contents—that the action of the air combined with the rays of the sun had inflamed the powder into combustion, with disastrous result. It relates that a short time before the catastrophe the captain in charge heard a noise as of sacks of walnuts being moved. He guessed the cause, called all his soldiers out, and ordered them to leave the fort; whilst he, thoroughly aware of the danger, coolly remained until assured that his men were in safety. A few moments later the explosion ensued, and the Powder Magazine was blown to the winds, leaving nothing but a heap of charred ruins to mark the spot where it once stood. And alas for Captain Speccemela!—his men got safely away; but he was caught, thrown down, and so battered, cut, and torn, that no hope is entertained of his recovery. [He has since died.] Among the wounded soldiers, too, there is a corporal whose courage and calmness are the talk of the hour. He was one of the last to leave the fatal spot, and was badly injured. It was found necessary to amputate one leg, which was torn to pieces. He refused to take chloroform, and bore the agony of the operation without uttering a word of complaint. When told that if he did not take chloroform he would suffer terribly, he quietly remarked: 'A soldier should not fear pain!' That was a Roman's reply!

And now for an instance of courage which almost rivals the fable of the sentinel found at his post at Pompeii. When the sentry who guarded the Magazine was ordered to leave the spot, he hurried out with gun and baggage. He threw himself flat on the ground when the explosion took place; and when it was all over, though horribly injured, took up his gun and walked back to his post, where he was found by the first rescue party. The King, who, as already said, was one of the first on the field, found the brave soldier, dusty, black in the face, with the clothes almost torn from his body, but with his gun, presenting arms. It is said the hero is to be presented with a gold medal for valour, by request of the King.

All the buildings for a mile round the spot have been destroyed wholly or partially. Of course any in the immediate vicinity of the Magazine are razed to the ground or blown completely out of sight. Of the Magazine itself nothing is left but a heap of charred ruins. The latest information as to the number of people who suffered by the explosion gives eleven dead and two hundred and fifty wounded.

A monk was noted amongst the rescue party conspicuous for his courage and indefatigable efforts. His fine tact and administrative powers soon placed him at the head of the willing workers; he was, in fact, the brains of the impetuous crowd. Yet he was unknown and a stranger. It would be interesting to learn something more of this heroic nature; but it is buried, I suppose, in the heart of the church. How his pulses must have thrilled to be working thus once more heart to heart with the people! Nor was it an ordinary gang of workmen that was to be seen there blackened by the terrific clouds of dust and smoke. Monks, Sisters of Charity, soldiers, firemen, and civilians worked side by side with breathless anxiety, cheered on by the

King, who, as he sprang into the ruins and tore away the stones with his hands, received round after round of acclamation from the ordinary workpeople of the crowd. Not until all the wounded were carried away did King Humbert leave the spot, and then it was for the Hospital, where he presented himself. To quote an Italian paper, the *Tribune*: 'No one would know that it was a sovereign who entered the ward. His blue suit was covered with a stratum of powder, his face was black and agitated with emotion, as he went from bed to litter with words of comfort and consolation for each sufferer. His boots were soiled, his hat crushed in, &c. As he left the Hospital he was received with loud *vivats* by the people crowding behind the cordon.'

The damage done to Rome has not yet been correctly estimated. In the eye of the artist and tourist it is apparently incalculable. We hear that the rare vases of the Etruscan collection in the Vatican gallery have shared the fate of the windows of Rome. Nearly all the galleries, palaces, and churches are closed for repairs. Some have suffered more damage than others; and it seems as though the most valuable of the stained-glass windows are most hopelessly wrecked. The streets glitter with crystals; so do the aisles of such churches as one can still enter.

Only a week ago we were luxuriating in the beauty of St Paul's *fuori i muri*. We could not tear ourselves away from that superb nave with its five pillared aisles, radiant in the gorgeous flames of light shed from the coloured windows beyond. Raising our eyes we confronted the gaze of these stately Apostles in their robes of purple, crimson, and gold, their grand heads looking with ineffable peace, ineffable dignity across the shadowy aisles. And now! all are a memory, for of St Paul's not one window remains to tell posterity of the beautiful works of art our eyes that day had seen. And Moroni, the artist who created these stately figures, whose cunning hands designed these treasures of St Paul's—alas! he is now but dust, and has carried his secrets with him to the grave.

So it may readily be seen that an Eldorado of gold could not repair the damage done to Rome by this terrific explosion.

DUMARESQ'S DAUGHTER.

CHAPTER XXVI.—DESPAIR.

THEY carried Psyche up to her own room, and laid her on the bed, and tended her carefully. 'She's been affected like this more than once before,' Haviland Dumaresq said with a pang of remorse, trying to minimise the matter to his own conscience, 'though never quite so seriously, perhaps, as to-day. Poor child, poor child! It's strange how sensitive natures respond to a stimulus. She's been watching this campaign with such singular interest; and the suddenness of the shock, after such hopes aroused, shows how much she's been over-exciting herself all along about it.'

As for Ida Mansel, she held her peace, and guessed the truth, for even Girton had not wholly extinguished her feminine instincts.

They poured a little brandy down Psyche's throat to revive her, and gradually and slowly she came to herself again. She never once uttered Linnell's name, and nobody about her alluded to him in any way. 'Tell me what was in the paper!' she said, with the calm of despair; and they read it aloud to her—every word of it ungarbled. She listened with her face buried deep in the pillow. 'Is that all?' she asked, as Ida Mansel ended. And her father answered in a choking voice: 'That's all, my darling.' After which she lay a long time silent.

At last she turned round and with a terrible calmness looked up in their faces. Her eyes, though open, were singularly vacant. 'Why don't you light the candles?' she cried like a peevish child. 'It's so very dark. All dark, everywhere!' And she flung her hands about her with a curious impatience.

Haviland Dumaresq stood up in his horror. The candles were burning on Psyche's dressing-table, and the little white room was as bright as daylight. With an agonised face he looked down at his daughter. 'Don't you see me, Psyche?' he cried, all aghast. 'Look up at me, darling. Try hard. Don't you see me?'

Psyche groped out at him with extended arms. 'Where are you, Papa?' she asked quite innocently. Then she fell back in her place and burst at once into a flood of tears. She was glad she had that cloak to cover her sorrow with. Too proud to acknowledge the meaning of her grief, she could at least let it loose under false pretences. She could cry as much as she liked for Linnell now. They would think she was only crying for her own blindness.

That same evening a telegram went up to London, addressed to the greatest oculist of the day, begging him in terms of urgent entreaty to come down at once to a new patient at Petherton.

And Haviland Dumaresq had reason to bless the blindness too, in his own way, for it took him off for a while from his remorseful conscience, and concentrated his thoughts upon Psyche's condition.

All the next day, Psyche saw nothing. And the day after that, and the day after that again.

But the eminent oculist who had come down post haste from town to see her, and who came down each evening again by the last train to watch the case—so profound was his admiration of the Encyclopædic Philosophy—held out to them the happiest hopes for her recovery, after a short interval. It was a purely nervous affection, he said with confidence: functional, functional: no cataract, no disintegration, no structural disease: the merest passing failure of the optic centres. It was all in the brain, he assured them with great assurance many times over. They had every hope. There was nothing to despair about.

Every hope! No hope for Psyche. Nothing to despair about! While blank despair hedged her in and environed her! How little they know about hearts, these doctors!

At first she fancied there might yet be a chance. Not for her, of course: that was nothing; but for her painter. All was so vague and uncertain at Khartoum. Youth is loth indeed to give up all for lost. So young a love, so soon crushed out: impossible! impossible! And even the papers, the London papers, those wise, sagacious, omniscient papers, held out doubts at first as to Gordon's death. Well then, if as to Gordon's, why not also as to Linnell's just equally? She could not believe he was dead, with that day unexplained. She could not think an explanation would never come. She hoped on against hope, till all hope was impossible.

Slowly and surely her faith gave way, however. Each fresh day's telegrams brought fresh grounds for doubting that any living soul had escaped the massacre. Deserters brought in news of the two or three Europeans still held in horrible slavery in Khartoum; and Linnell's name was not among them. Day by day, the terrible certainty grew clearer and ever more clear to Psyche that her lover lay dead in the heart of Africa.

And yet, strange to say, the specialist was right. Psyche's blindness was only temporary. Hour after hour, as hope gradually sank and died out within her, her eyesight was slowly but surely restored to her. In three or four weeks, she was as well as ever—to all outer view—as Ida Mansel observed her. But her heart—her heart was crushed within her.

Weeks rolled on, and months passed by, and the fate of all who had fought at Khartoum grew from time to time more fixed and certain. Spring returned, and with it Geraldine Maitland. For that congenial companionship Psyche was glad, as far as she could be glad for anything now; for Geraldine was the only living soul with whom she could talk—not freely, but at all—about her lost painter. To her father, she never even mentioned his name: the subject was a sealed book between them. It was too awful a shadow to recognise in speech. There are ghosts one can only pretend to avoid by strenuously ignoring them in the bosom of the family. Haviland Dumaresq knew in his own soul he had sent Linnell away to his grave; but he had done it for the best; he had done it for the best. No man is responsible for the unseen and unexpected contingencies of his actions. We must be judged by our intentions, not by results. How could he know the young fellow would run away with the precipitancy of youth into danger's mouth? All he wanted was to protect Psyche. His sole object in life, now, was his daughter's happiness.

His daughter's happiness! Oh futile old philosopher. If only men and women would just be content to let each of us live his own life, undisturbed, and not scheme and plan and contrive so much for the happiness of others—how very much happier we should all be for it!

Haviland Dumaresq had meant to take Psyche up to London for the season that coming spring, and introduce her to those powerful friends of his—for he had friends, not a few, in virtue of his apostolate—by whose aid she was to make that brilliant marriage which he still wildly dreamed for her in his opium ecstasies. He had even, by superhuman efforts, provided beforehand the needful money for going into lodgings, good fashionable lodgings, for some months in town, where he might launch his Psyche upon the great world of London; and Ida Mansel, most practical of heads, had promised to find an eligible tenant meanwhile for the Wren's Nest, at the usual rate of furnished houses at the seaside in early summer. But when May came round—that smileless May—poor Psyche's heart was still so sore that Haviland Dumaresq shrank himself from putting his own plan into execution. It would only spoil her chances in the end to bring her out while this mood was upon her. After all, he thought, there was plenty of time yet. His rosebud was still so young and fresh: no need to hurry. Let her get over this girlish fancy first about a blighted heart: girls are so plastic: and then, when she'd forgotten her supposed romance—young people take a hysterical delight in imagining themselves unhappy—he could fulfil his plan of taking her up to town, and give her a fairer chance in the matrimonial lottery with the gilded youth of our teeming London.

For at Petherton, Haviland Dumaresq was a very small person; but in London, he knew, more than one rich man's son would be proud to marry Haviland Dumaresq's daughter. In that mighty mart, where everything finds its level so soon, even true greatness is more justly and generously appraised than elsewhere. The provincial celebrity sinks at once to his proper place; but then, *en revanche*, the truly great man who ranks in his shire but as a third-rate personage finds himself in London duly estimated at his right worth by a more critical audience.

So the spring and summer passed slowly away; and autumn came again, and with it the anniversary of Linnell's departure.

All through the summer, Psyche's eyes had troubled her again from time to time; but she thought very little about her eyes now: of what use to her were they? The only thing on earth she cared to see was gone for ever. They would never help her to see her painter again. For despair itself becomes at last a sort of sacred cult, a mysterious pleasure.

Still, in a certain vague indefinite way, without herself attaching much importance to the subject, Psyche dimly noticed a change in the character of the disease. Though she saw very well for most of her time, she observed that the periods of dimness were much more frequent now than of old, and the periods of total loss of vision, when they came, remained far longer and were altogether more persistent in every way than in the early stages. She recognised to herself, with a strange uncomplaining Dumaresquian acquiescence, a fatalistic acceptance of the order of the Cosmos, that she was slowly going blind, for no particular reason, but merely because the will to see was failing her.

She concealed it as far as she could, of course, from her father. She couldn't bear to vex the old philosopher's soul, to pile on that pathetic unsuccessful life one more great failure. He loved her so dearly and was so proud and fond of her. To be sure, it was only putting off the evil day. But Psyche put it off with all her might for all that. Papa was old and far from strong. Psyche knew in her heart he couldn't live many years longer. Why vex his last days needlessly with this final burden? Was it not enough and more than enough that that great soul should find itself in old age poor and broken and weighed down with sorrow without adding that last straw to complete the disaster? The pathos of Haviland Dumaresq's nobly wasted life sufficed as it stood: Psyche at least would do her best to conceal from him whatever might add to his misery.

So she strove hard to hide from him her growing blindness. If the dim fit seized her as she sat and read, she would lay down her book and remain sitting and talking without showing it in any way till her eyes began slowly to resume their function. If it came upon her when she was out walking on the downs with her father, instead of going on and groping her way, which would have betrayed her case, she would pause and pretend to be scanning the landscape, or would sit down on the turf and pull grasses by her side, while her father looked on and never suspected the reason for her wayward conduct. Now and then, to be sure, circumstances arose where it was impossible wholly to conceal the facts. She might be reading the paper aloud to her father, and be compelled by that sudden mistiness of the words to break off all at once in the middle of a sentence: or she might be walking down the quiet main street of Petherton, and find the visible world in one moment of time transformed into a vast blank of darkness before her. But even so, she noticed one curious fact. These blind fits overcame her least often in her father's presence; and by a violent effort of will, when he was by, she seemed able actually to command her eyesight. The strong stimulus of a vivid desire to save him needless pain conquered the weakness and feebleness of nerve which alone made the solid earth thus fade into nothingness before her eyes at a moment's notice.

Nay, in her father's presence, Psyche even pretended not to feel sad: she tried hard to bury her grief from his eyes: for his sake, she would still appear to be young and joyous. Though her heart ached, she would still play lawn-tennis on the Maitlands' court and still talk nonsense, hateful, light-tongued nonsense, with the mild-eyed young curate. She was her father's daughter, and could she not walk in her father's way? Had she not inherited his iron nature? Her heart might break, indeed, but no daw should peck at it. She kept her sacred sorrow locked up securely in her silent breast. And there, it succeeded in eating her life out.

With Geraldine Maitland, however, she was less careful of concealment, at least as regarded her fits of blindness. The two girls walked and talked on the downs much together; and it often happened that in the midst of their conversation

Psyche's feet and tongue would falter unawares, and she would put out her hands to grope her way before her through the thick darkness that all at once enveloped her steps. As the summer wore on—so Geraldine noticed—these sudden failures grew more and more common. On one such occasion, indeed, when they were strolling along the face of the east cliff, near the tumbling sea, the world became a sudden blank to Psyche, and she sat down despairingly on the short smooth grass, with her sightless eyes turned toward the waves and the warm sun of summer.

'What's the matter, dearest?' Geraldine Maitland asked in her sympathetic way, for Geraldine when she wished could be very womanly.

'It's all gone again,' Psyche answered with a sigh. 'Oh, Geraldine, it all goes so often now. I don't feel as if I'd strength to fight against it, even for Papa's sake, any longer.'

Geraldine's face was very grave. 'What does your father say about it, Psyche?' she asked seriously. 'He ought surely to take you up to town to a doctor.'

'Oh, no; not that!' Psyche cried, shrinking back with infinite horror. 'I don't want doctors to go cross-questioning me and torturing me any more. I can bear it all, if I'm only left alone; but I can't bear being worried and cross-examined and bothered by dreadful men about it.'

'But what does your father think?' Geraldine persisted still. 'I'm sure he ought to do something to set it right again.'

'He doesn't know—or he hardly knows at all,' Psyche answered quickly. 'I've kept it from him as much as I can. I don't want to cause him any needless trouble.'

Geraldine held her peace and answered nothing. But in her own mind she had decided at once what was the proper thing for her to do. She would tell Haviland Dumaresq that very day how Psyche fared, and would urge him to take some competent medical opinion.

That evening, Psyche took tea at the Maitlands'. She noticed the General, always bland and polite, was even blander and politer than usual in his demeanour towards her. His courtesy had in it a touch of that tender and chivalrous gentleness which old soldiers, more perhaps than any other men, know how to display on occasion to a woman in distress. Even Mrs Maitland, as a rule so painfully cold and distant, unbent a little that day to the motherless girl. She called her 'My dear' more than once, and it was not the 'My dear' of conventional politeness with which women hold one another off far more effectually than with the coldest courtesies: it was the 'My dear' of genuine feminine interest. After tea, too, Psyche observed that Geraldine slipped away for a quarter of an hour on some vague excuse, though she didn't attach much importance at the time to her sudden departure. When Geraldine returned, her eyes seemed somewhat red from crying, and she gave no explanation of where she had been, further than to say with an evasive smile that she had run out for a bit on a little private errand.

At seven o'clock, Psyche returned to the

Wren's Nest. She opened the door with a noiseless hand, and walked unexpectedly into the little drawing-room. For a moment the haze gathered over her eyes; as it cleared away she saw to her surprise her father, that strong man, sitting bowed and bent with sorrow in his easy-chair, his hands clasped hard between his open knees in front of him. Tears were trickling slowly down his bronzed cheek; his attitude was eloquent of utter despondency. On the table by his side stood a little glass bottle—quite empty. Psyche, in her sudden speechless terror, remembered to have seen it on the mantel-shelf that morning, full of those little silver-coated pellets which she somehow associated in her own mind—though she couldn't say why—with her father's frequent and distracting headaches.

'Why, father dear,' she cried, flinging one arm round his neck in an access of sudden energetic sympathy, 'what on earth does this mean? What's the matter with you, darling? And why—is the bottle—on the table—empty?'

Her father looked up at her and nodded his head slowly and despondently. 'It's lost its effect,' he answered in a very hollow voice. 'It's lost its effect altogether, I'm afraid. One after another, I've taken them in turn, and found no relief from this tremor of my nerves.—I never took so many in my life before.—I was frightened myself when I wanted another and found I'd taken the whole bottleful.—They do me no good; they do me no good now. What can I turn to, to relieve me from this misery?'

'Father!' Psyche cried, with a sudden burst of horrible intuition, 'it isn't opium? Oh, for Heaven's sake, tell me, it isn't opium!'

The old man drew her down to him in a wild spasm of remorse and affection. 'My darling,' he cried in the fervour of his regret, 'don't ask me its name! don't put any name to it! Forget it, forget it: I never meant you should know. But whatever it was, Psyche, from this day forth, for your sake, my child, I solemnly promise you, I have done with it for ever!'

There was a moment's pause. Then Psyche said again: 'Was it that that was troubling you when I came in, Papa?'

Haviland Dumaresq looked back into her deep blue eyes with those truthful eyes of his. He was too organically moral to mince a lie with her. 'No,' he answered shortly, though with a terrible wrench. 'It was *not*, Psyche.'

Again there was a pause. Then Psyche whispered very low once more: 'Has Geraldine Maitland been here this evening?'

Haviland Dumaresq groaned, but he answered, without one moment's hesitation: 'Yes, Psyche.'

Psyche drew over a chair from the wall and seated herself beside him. She held her father's hand in her own, tenderly. For three minutes those two who loved one another so strangely sat there in silence. At last Psyche looked up and said in a very low voice: 'Well, Papa?'

Dumaresq put one hand to his forehead and sighed. 'To-morrow, Psyche,' he said in a dreamy way, 'we go up to London. I want to take medical advice about myself—and I shall seize the opportunity at the same time of asking Godichau's opinion about your eyesight.'

Psyche dropped his hand resignedly. 'As you will, Papa,' she said in a very soft whisper. 'But

I never wanted to trouble you, myself, about so small a matter.'

And all that night she lay awake and cried—cried in her silent, tearless fashion.

THE ORNAMENTAL USES OF NUTS AND SEEDS.

MANY kinds of seeds, fruit-stones, nuts, and beans are employed for making necklaces, bracelets, and for other ornamental purposes in various countries. The vegetable-ivory nut, the cocoa-nut shell, and many other hard species, are carved into pipe-bowls and various fancy articles, and are susceptible of a high polish. The woody rind of the calabash fruit and of some gourds form indispensable articles of domestic use among aboriginal races in a semi-civilised state, serving all the purposes of glass and earthenware for holding water, food, and oil; drinking-cups, spoons, and snuff-boxes are also made of them; and many are painted and ornamented. Out of the small rind of the bottle-gourd are formed the drinking-cups for the Paraguay tea, and the water-vessels of India.

Some of the economic uses, chiefly decorative, of many of these, gleaned from different sources, combined under one heading, may not be without interest, as showing how widespread is the ornamental application of nuts and seeds.

The large seeds of the Necklace Tree of the West Indies, of a brilliant red hue, with a black spot at one end, have been often used for sleeve links and shirt studs. The red seeds of the coral flower are also used for ornamental purposes. The fragrant kernels of *Prunus Mahaleb* strung as necklaces are much valued by the women of Sind and other parts of India. Snuff-boxes are made in Natal and Gaboon by the natives of the seed of *Oncoba spinosa*. In the Portuguese settlement of Ambriz, Africa, the seeds of the Custard Apple are strung upon thread for necklaces; and in the Kew Museum are rosaries made of olive seeds and other fruit-stones. The dry seeds of the Sacred Lotus (*Nelumbium speciosum*), also known as the Pythagorean bean, are often strung as beads. The black nuts of *Putranjiva Roxburghii* are made into necklaces and rosaries, and are worn by the Brahmins, and also put round the necks of children to keep them in health and to ward off disease caused by evil spirits.

The seeds known as Nicker beans and Bonduc nuts, species of *Guilandina*, are often used for bracelets, necklets, and rosaries, and are very ornamental when capped and set. Baskets and other fancy articles made of them are very common in most museums. There are two species, *G. Bonducella*, the seeds of which are of a gray leaden colour or a slaty olive green; and *G. Bonduc*, which are pale yellow or orange coloured. In the Malay Archipelago these seeds are used as counters and playthings by children in place of marbles; and on the Gambia in playing a game called warree-warree. In Bombay, strung upon red silk, they are worn by women as a charm; and also in Egypt by women and children as amulets against witchcraft and sorcery. They are sometimes known as the fever-

nut, being a powerful tonic. The small round black seeds of *Canna indica* are used by the Burmese for sacred beads and by Hindus for necklaces. They are called in Guiana, buckshot, for the natives use them as shot in their blow-pipes.

The hard bony seeds of the Bladder-nut are in some parts of Europe threaded for pater-nosters and made into necklaces and chaplets. The small black soap-nuts, or kernels of *Sapindus saponaria*, take a fine polish, and are threaded as necklaces, rosaries, bracelets, and other ornaments. The Quandong nuts of Australia are frequently strung as necklaces and bracelets and also mounted as scarf-pins.

Several kinds of hard brown beans have been utilised for making bracelets and other ornaments. Their plainness and monotony are varied by gilt or steel studs and settings, and small beads intermingled with ornamental pendants. The horse-eye bean, the seed of *Mucuna urens*, is really ornamental and curious when mounted for bracelets. The large brown sword-beans of species of *Entada* have been made into spoons, snuff-boxes, small coin-cases, scent-bottles, &c. The small brown seeds, something like apple pips, so commonly used, when strung thickly together, for bracelets, work-bags, nets for the hair, and other ornamental work, are the produce of *Desmanthus virgatus*. They are frequently dyed black for effect. The bright scarlet seeds of *Adenanthera pavonina* are used as jewellers' weights in India, each being about four grains. They are also strung and made into necklaces. In the West Indies they are known as Circassian seeds.

The small shining red seeds of *Abrus precatorius* are largely used by the Indian goldsmiths as weights, each weighing about 1.75 grains. It is stated that the famous Koh-i-nur diamond was first weighed by the *rati*, a word which by some authors is supposed to have given origin to the jewellers' carat, from the Arabic *kirat*. The carat is the twenty-fourth part of an ounce, or three and one-sixth troy grains; this approximatively would be equal to two of these seeds. They are sometimes called crab's eyes, from a fancied resemblance to those objects; and in the West Indies are known as jequirity seeds, being extensively used for necklaces, ornaments for the ears, and to decorate small boxes, baskets, &c. Strung as necklaces, they are considered teething remedies for young children. The fact of their being used as rosaries doubtless suggested the specific name of '*precatorius*.'

The stone from the succulent fruit of the common bead-tree or Persian lilac is used all over India as a bead. They are perforated and strung into necklaces and rosaries. During the prevalence of epidemics of smallpox, &c., they are suspended as a charm over doors and verandas to keep off infection. The nuts of *Euonymus grandiflorus* are made into necklaces; and the red seeds of another species are strung into ornaments for the head in India; the seeds of *Gyrocarpus Jacquinii* are also made into rosaries and necklaces.

The stones of certain kinds of dates, like those of Rosetta and Burlos, being rather large, are carved and pierced to make beads for rosaries. The stones of a species of *Canarium* (often called

peach-stones) are beautifully and elaborately carved by the Chinese; and when set in gold, or separated by gold filigree beads, form exceedingly handsome brooches and bracelets. Amoy is renowned for this kind of work; and some of these beads cost a dollar each, a very large sum when the slight remuneration in China for skilled labour and the cost of native living are borne in mind.

The furrowed sculptured bony fruit of the *Elaeocarps* being freed from the pulp form handsome necklaces, which are not uncommonly set in gold or silver and sold in the shops. The hard endocarp of *Elaeocarpus serratus*, and the beads of another species, are largely exported from the Eastern Archipelago to Arabia, Persia, and India, for ornaments of all kinds, necklaces, bracelets, and rosaries or chaplets. The five-grooved and elegantly-tubercled nuts of *E. Ganitrus* are worn as a necklace by the followers of Siva in order to gain his graces and a passport to heaven. They are also supposed to preserve the health. Considerable importance is attached to the number of facets on the seeds. They are commonly known as Brahmin's beads. Those of *Monocera tuberculata* are used for a like purpose in Travancore.

Necklaces and bracelets are made of *Mimosa* seeds. At the Colonial Exhibition held in London in 1886, in the West Indian Court there was a very large display of ornamental articles made of nuts and seeds. The very hard seeds of *Symplocos spicata*, about the size of a pea, and resembling minute pitchers, when perforated, are strung like beads by the natives of India and put round the necks of children to prevent evil. The green seeds of *Dalbergia Sissoo* are worn by Santal girls as pendants from the ear. In Tahiti the natives make crowns and necklaces with the red seeds of *Pandanus odoratissimus*.

A seed much used for ornament is that which bears the popular name of Job's Tears. The old botanist Gerarde thus describes it: 'Every graine resembleth the drop or tear that falleth from the eye.' There are, however, now three or four well-marked forms of this seed met with in India, which differ from each other in shape, colour, and degree of hardness, and in the presence or absence of grooves or furrows along the length of the hardened involucre. Dr Watt of Calcutta thus enumerates them: There are three types of shape—a long cylindrical or tubular, a normal pear-shaped condition, and a flattened spheroidal form. The cylindrical grain is always of a white colour, smooth, polished, not furrowed, but constricted towards both extremities. This is collected for ornamental purposes only, and not as an article for food. The pear-shaped form varies in size and colour, pale and bluish white, gray, yellow, or brown black. The flattened spheroidal kind are often yellow, or even pink. The two principal forms are—one almost round and either white or black. This form is sometimes, though less frequently, used for rosaries and ornamental purposes, but chiefly for food among the hill tribes of India. The second form is tubular, about half an inch long. This is extensively employed for decorative purposes, the dresses worn by the Karen women being often completely covered with embroidered designs of this grain.

It is also used in Siam, and by the Naga and other Assam tribes, in the construction of earrings and other simple and elegant articles of personal adornment. Necklaces of these seeds are frequently worn; and baskets and other ornamental articles are occasionally decorated with them, especially those made in Nepal. The Angame Nagas construct elegant earrings in which a rosette of these seeds surrounds a greenish beetle wing. These grains seem to stand a good chance of coming into more general use in Europe in the construction of artificial flowers, laces, bugle-trimmings, and other such purposes, for which glass beads are now used; and possibly also in Catholic countries for the manufacture of rosaries.

The seed-vessel of the Sandbox Tree is known as Jack-in-the-box, Monkey's Dinner Bell, &c. It is from the noise caused by the bursting of the fruit that the plant gets its curious names. It is used both as a pounce-box and a letter-weight. Large walnut shells are frequently mounted with hinges and used as ornamental cases for Limerick gloves, rings, jewels, and miniature articles for presents. The nut of *Balanites Roxburghii* is employed in fireworks in India as crackers. A small hole is drilled in it, from which the kernel is extracted, and being filled with powder and fired, bursts with a loud report, so exceedingly hard is the shell. The hazel nut has lately been mounted in silver as an appendage to a brooch or bracelet for ladies.

The vegetable-ivory nut of commerce is the albuminous seed found in the drupes of a dwarf palm. From these nuts European turners fashion the reels of spindles, small boxes, and many other little fancy articles, which can be coloured with sulphuric acid.

Passing to other seeds of palms, we find several utilised for decorative purposes. Betel nuts, the produce of the *Areca* palm, are chiefly used as a masticatory by the natives of the East. They are too small to be applied to many ornamental uses; but are occasionally employed by the turner and wrought into different kinds of fancy-shaped beads for bracelets, small rosary cases, and other little fancy articles. In the Museum of Economic Botany at Kew there is a walking-stick made of these nuts, sliced, mounted or supported on an iron centre. The cocoa-nut shell after being dried and scraped forms the Indian hookah, which is used by all classes for smoking tobacco. In Malaysia, the shell, under the name of Parut, is used for children's games. It is taken between the two feet and sent as far backwards as possible by a twist of the foot. The cocoa-nut shell also furnishes drinking goblets, which, carved exteriorly and mounted in silver, are a great ornament. Small articles, as baskets, ladles, spoons, and other such domestic articles, are made of it. Beads for rosaries are also turned from the shell.

The hard mottled nuts called 'coquillas,' the produce of a South American palm, used to be imported to the extent of several hundred thousand a year, but are now scarce. They take a fine polish, and were shaped by the turner into various small ornamental and useful articles, such as knob-handles for cabinet drawers, for walking-sticks, parasols, bell-pulls,

small fancy-boxes, &c. The hard stony seeds of the Tucuma Palm and of the Macan Palm are susceptible of a high polish, and are sometimes fancifully carved into rings, 'birios' or knitting-pins, &c.

The fruit of the Talipot Palm is hard like ivory, and is extensively employed in the manufacture of beads for Hindu devotees, which are known in trade as Bazarbatie nuts. A considerable trade is done in these nuts from Bombay, the supply coming apparently from North Kanara and Ceylon. They are sometimes coloured red and sold as coral, or are made into small draughtsmen, little bowls, and other ornaments. In Europe they are now largely employed in the manufacture of buttons.

The kernel of the fruit of the Doum Palm is turned into beads for rosaries; and is also made into little oval-shaped boxes for holding snuff. These have a small opening at one end, stopped by a wooden peg. The speckled albuminous seeds of an African *Sagus* are carved into little figures by the negroes. The hard nut of the Dwarf Palm is in Algeria turned into chaplets, bracelets, and necklaces, which are esteemed for their pretty veinings of various colours.

From this enumeration it will be seen that, by skill and ingenuity, many nuts and seeds which have little or no commercial value are, however, utilised for ornamental purposes.

MRS HARRINGTON'S DIAMOND NECKLACE.

CHAPTER II.—CONCLUSION.

MRS HARRINGTON'S fine eyes had never looked more brilliant and more malicious than when they rested on the pale but composed countenance of the tutor as he quietly entered the saloon leading Freddy by the hand.

'Excuse my somewhat abrupt summons, Mr Cunningham,' she said, speaking very courteously, though there was a ring of covert triumph in her clear tones that warned Ralph that she meant mischief. 'But a circumstance has occurred which renders it imperative that I should speak collectively to every member of this household.'

Ralph bowed, but made no reply, though he could not repress the slightly sarcastic smile which played upon his lips as he noted the judicial formality of her manner.

'This morning—indeed, not more than an hour ago, I found that, probably during the night, I have been robbed of a very valuable diamond necklace. My maid, Morris, and I at once made a careful examination of the room where, as most of you know, I am in the habit of keeping my jewels. We found, much to our surprise, that the room had not been entered from the outside: the window was securely bolted, and there were no signs whatever of any evil-minded person having effected an entrance in that way. I am therefore forced to accept the other explanation of this extraordinary affair—namely, that my room was visited by some one from inside. Of course, it is just possible that the thief may have gained admittance to the house from some other

part of the premises, and found his or her way to my apartments; you, Walters, will be better able to speak with authority on this point than I can. Will you tell us if you found any door or window open this morning?'

The old butler, who had served his mistress faithfully ever since her arrival at the Hall as a bride, twelve years ago, at once declared that he could solemnly swear that no signs of burglary had been visible when he went his rounds early that morning. A look of genuine concern was on his honest countenance as he met Mrs Harrington's eye, and certainly the most suspicious woman on earth would have instantly acquitted him of having had anything to do with the disappearance of the necklace.

'Has anything else been missed? Is all the plate intact?' queried Mrs Harrington.

'There is nothing missing, ma'am. If you will examine the strong-room'—

'I am quite ready to take your word,' interrupted his mistress with a smile that strove to be kindly.

'My daughter tells me that she also has lost nothing,' she continued.

'Mr Cunningham, can you say the same?' Her cold bright gray eyes were suddenly flashed on the tutor.

'I have lost nothing,' he answered quietly.

'Then it seems that the thief was contented with my necklace for spoil.'

Here the servants looked at each other with dismay; it was clear to the meanest understanding that Mrs Harrington suspected that some inmate of the Hall was the thief. There was a low buzz of whispers as their mistress ceased speaking; the cook and butler exchanged a few words, and then the latter spoke out.

'We are all agreed, ma'am, that the fairest thing to everybody would be that our boxes should be examined. No one has left the house this morning. If, as I fear you think, ma'am, the thief is here present'—

'I think nothing of the sort, Walters; I have only mentioned the facts of the case, which I certainly think go to prove that the thief gained admittance to my apartment by the door, and not by the window. At anyrate, I intend to place the affair in the hands of a person more competent to decide on the matter than myself. Directly I made the discovery that I had been robbed, I despatched my maid to the station to telegraph to Leatherhampton for the inspector of police, who, I expect, will arrive in less than half an hour. In the meantime I desire that you will all remain in the saloon.'

The servants again exchanged glances of consternation. Such an unprecedented occurrence as this would furnish food for gossip in the servants' hall for many a year to come. Even the presence of their mistress and the uncomfortable chill that had suddenly fallen on the assemblage did not silence the hum of whispered talk among the men-servants and the maid-servants, who waited with what patience they could command for the next act in this tragedy-comedy of the mysterious burglary.

The half-hour expired at last. Mr Cunningham had throughout maintained an attitude of polite indifference; Gladys had been studiously silent; and little Freddy, who had only half understood

the scene, still clung to the tutor's hand with an expression of mingled wonder and terror in his big brown eyes. Mrs Harrington had seated herself in one of the deep easy-chairs scattered about the saloon, and made a pretence of glancing down the columns of a newspaper. Her face was pale and her lips firmly set; but the hand which held the newspaper shook slightly, thus betraying the emotion she strove so hard to hide.

The arrival of the inspector of police was a relief to every one. Mrs Harrington briefly explained to him what had occurred, and her reasons for supposing that the theft of the necklace had been accomplished by an inmate of the Hall.

'Such a suspicion is of course very painful to me,' she finished; 'but under the circumstances, Mr Inspector, though I deeply regret the necessity, I think it better for the satisfaction of all concerned, that I should accept the offer made by my servants, and request you to search their boxes.—You, Mr Cunningham,' she added suddenly, addressing herself to Ralph, 'will, just for form's sake, undergo the same unpleasant ordeal.'

For an instant the tutor's self-possession was disturbed; the colour rushed to his face, and he was about to make some protest against the indignity, when a warning glance from Gladys checked him. 'Most certainly,' he said, 'when Mr Inspector has searched the servants' rooms he is quite at liberty to ransack mine. I will remain here with Miss Harrington and the servants while the examination is in progress,' he added.

Mrs Harrington and the inspector left the saloon, and again the hum of whispered conversation was audible. Gladys, with a queer smile on her beautiful lips, sunk into the chair her step-mother had quitted, and turned her attention to the newspaper which had served that lady as a pretext for silence during the purgatorial half-hour that had followed on her strange exordium.

Ralph seated himself at some distance from Gladys, and Freddy nestled at his side with a look of puzzled anxiety on his childish face. Once Gladys looked across to the tutor; the look said plainly: 'This ordeal must be borne for my sake. I love you, and trust you; cannot you trust me?'

Ralph smiled an affirmative, and let his thoughts drift into a pleasanter channel than that of Mrs Harrington's enmity, her plot to ruin him, and the strange upshot thereof.

An hour passed; the whispers of the servants were hushed; their curiosity was on tiptoe, for in the silence that had suddenly fallen on the saloon they caught the distant sound of the inspector's deep bass voice, and the rustle of Mrs Harrington's silk dress descending the stairs. The search was over; what had been the result?

In another moment the lady and the inspector advanced to the table in the centre of the saloon. Mrs Harrington's eyes flashed full on Ralph's face, and for the moment the mask of courtesy she had hitherto worn in his presence was lifted; and hatred, rage, and baffled malice looked out at him from under her level brows.

'Have you found your necklace, Madam?' said the tutor.

'I have not; the thief has probably hidden it too well,' was her biting reply.

'On his or her person, perhaps,' suggested Ralph ironically. 'Allow me to set an example, which no doubt others will be glad to follow.—If you, Mr Inspector, will come up to my room, I will gladly submit to a personal search.'

Mrs Harrington was shamed at last. There was no mistaking the significance of the tutor's words. He had found out the abominable plot she had concocted, and he meant her to know that he had done so.

'I cannot allow such an indignity to be put upon my son's tutor,' she said, dropping her eyes.

'Mr Inspector, you are witness that I have offered to submit to a personal search; Mrs Harrington declines to avail herself of my offer.'

The inspector, understanding that there was more in the affair than met the eye, bowed respectfully to the tutor, and then asked Mrs Harrington if she desired him to prosecute any further inquiries.

'Certainly,' she answered defiantly. 'I have had a valuable article of jewellery stolen from me under most extraordinary circumstances. I wish no pains or expense spared; and I offer a reward of one hundred pounds for any information that shall lead to the discovery and apprehension of the thief.'

The inspector pulled out his pocket-book and instantly made a note of this; then turning to Mrs Harrington, asked whether he had her permission to interrogate each member of the household in private.

'Most certainly; I give you *carte blanche* in the matter,' the lady replied. 'But as the unfortunate affair has somewhat upset my nerves, I shall now retire to my own room. I leave the further conduct of the case to you with the greatest confidence.'

With this gracious speech Mrs Harrington left the saloon and remained invisible until dinner-time. The intervening hours were spent by the inspector in cross-examining the servants, in a minute investigation of the premises, and in making copious notes in regard to every item of evidence he elicited. About six o'clock the worthy official took his departure; and every man, woman, and child at Harrington Hall breathed more freely when relieved from the overwhelming majesty of the Law, individualised in that awe-inspiring personage.

When Mrs Harrington rang her bell to summon the faithful Morris to assist at her evening toilet, that valued factotum appeared in tears and with an open telegram in her hand. She had just received the distressing intelligence that her father, a respectable publican, residing at Holloway, lay dangerously ill. Would her kind mistress allow her to go up to London by the last train? She, Morris, would break her heart if 'anything happened' to her dear old father, and she, his only daughter, was not there to receive his dying blessing.

'Of course you may go. I am very sorry to hear of this trouble.—When is the next train?' said Mrs Harrington sympathetically.

'There is one at seven, ma'am.'

'Then go by that; you have half an hour to get to the station.'

'But who is to dress you for dinner, ma'am?'

'Send Jane to me; she will be able to do all I want.'

With profuse thanks and tears, Morris left her mistress, packed a small bag of necessaries, and was driven off to the station by a sympathising groom, who had long cherished an admiring regard for the comely abigail, and was believed to entertain matrimonial intentions on her behalf.

Dinner that night was a disagreeable ordeal alike to Mrs Harrington, Gladys, and Ralph. The first was slightly sulky and ashamed; the second, covertly indignant; and the third, though outwardly self-possessed, was bitterly aggrieved at the humiliating position in which Mrs Harrington's treachery had placed him.

When dinner was over, Gladys pleaded a headache as an excuse for going straight to her own room; and Ralph strolled out into the garden to smoke a cigar, a sedative which he sorely needed. But he was not fated to enjoy his 'weed' in peace, for he had scarcely established himself in his favourite nook in the shrubbery when he caught sight of a white gown through the trees, and in another moment Gladys, looking pale, scared, and agitated, seated herself at his side.

'What has alarmed you, darling?' he said, flinging away his unfinished cigar and encircling her with his arm. The poor girl was breathless and palpitating, and her eyes were dilated with alarm.

'Oh Ralph!' she panted, 'that horrid necklace!'

'Has it been found?' queried Ralph sharply.

'No; it is gone—really and truly gone, this time. When you brought it to me this morning and explained my step-mother's wicked plot to disgrace you, I was tempted to fling the miserable thing into the lake there. But I remembered how she valued it: it was one of my father's wedding presents to her, and is worth two or three thousand pounds, I believe; so I hid it away in my dressing-case, as I told you I would. But just now, when I went to look if it was safe, I found that it was gone.'

'You locked your dressing-case, of course. Has the lock been tampered with?'

'I think not; but you know how careless I am about keys and things. When I changed my frock at luncheon-time, I probably left the keys in the pocket. At anyrate the necklace has been taken from my dressing-case by some one. Oh Ralph, it seems as if my step-mother is to be punished for her cruelty to you! Just think what a wicked thing—to go to your room and hide her miserable diamonds in your portmanteau, and then to get up that wretched comedy in the saloon, hoping to disgrace you before the servants and every one, because she was determined to—to part us.'

'But, dearest, this is not a time to ponder Mrs Harrington's misdeeds. The question is, who has taken the diamonds, and how are we to recover them?'

'Perhaps mamma has taken them herself. She would be quite capable of purloining my keys and—'

'Hush, hush, Gladys; don't be hard on her.'

'You may forgive her, but I never can,' cried the girl passionately. 'Just think what your position would have been had you not found that tassel of beads!'

'You would have believed me innocent, Gladys?'

'I? Oh Ralph, darling, of course I would! I would stake my life on your honour and truth. But think of the cold, stealthy treachery of a woman who could creep into your room and deliberately plan a thing so wicked and so mean!'

'My dear girl, do try to be calm. That necklace must be found. Do you think any one could have overheard our conversation this morning?'

'It is just possible; we were sitting on this very bench,' said Gladys, looking round at the shrubs, growing thickly on three sides of the seat, which was placed in a sort of alcove of closely-cut laurels and yews. 'A path leading to the stables runs just at the back. Could any of the servants— But no; I don't believe any of them is capable of theft.'

'I think we shall be forced to assume such a possibility,' said Ralph gravely. 'The first thing to find out is if any one has left the Hall during the afternoon or evening. I scarcely think that a thief would attempt to hide the jewels in the house after this morning's affair.'

'No one has left, I am sure, except Morris, mamma's maid.'

'Hum! Do you know why she left?'

'She had a telegram from home summoning her to her father's sick-bed.'

'Do you know anything of Morris's antecedents?'

'Oh Ralph, surely—surely you don't suspect her! Why, she has been years at the Hall, and my step-mother has the greatest confidence in her.'

'Didn't Mrs Harrington say this morning that Morris was the messenger she despatched to the station to telegraph to Leatherhampton for the inspector?'

'Yes; but'—

'Then, my dear Gladys, I think we have a clue; but for the present we must keep our suspicions to ourselves, and wait the course of events. Meanwhile, I shall do a little detective-work on my own account.'

During the next two or three days Mr Inspector paid frequent visits to Harrington Hall; but no further evidence was elicited, and the diamond necklace robbery still remained enveloped in mystery. Ralph's amateur detective work had, however, not been equally barren of result. On the morning following Gladys' discovery of the real theft, he paid a visit to the station, and learned from the telegraph clerk that Mrs Harrington's maid had despatched two telegrams on the previous morning, one to London, the other to Leatherhampton. Ralph tried hard to get a sight of the telegraph forms; but the man declared that to allow such a breach of official discipline would be as much as his place was worth.

On his return from the station Ralph confided to Gladys the result of his inquiries; and the two conspirators decided to follow up the

clue thus obtained, and to place the affair in the hands of Mr Jonas Lynx, a noted private detective in London. While the country police were leisurely deliberating on what steps to take in regard to the Harrington Hall burglary, the experienced Mr Lynx had discovered the whereabouts of Miss Julia Morris, had satisfied himself that the respectable Mr Morris of Holloway was a purely mythical personage, and that the place where Miss Morris was living was the temporary headquarters of a gang of light-fingered gentry with whom she was closely connected—her brother being a distinguished member of the Fraternity of the Skeleton Keys and Crowbar. He also identified that clever young woman as one Sarah Brown, who, fifteen years before, had picked oakum in one of Her Majesty's jails for a term of twelve months. Three days later Ralph was informed that Miss Brown, alias Morris, had been arrested at Liverpool when about to go on board the screw steamer *Hawk*. The diamonds, however, were not in her possession, the stones having probably been unset within a few hours of their appropriation, and sent over to Amsterdam, where they were placed in the right hands for sale. At anyrate, Mrs Harrington's diamond necklace ceased to exist, and that amiable lady thus paid dearly enough for her treachery.

But the consequences of her malicious deed did not end with the loss of the jewels. Not only was she compelled to appear in court and give evidence against her former maid, but she suffered untold agonies of mind lest Morris should divulge the fact that the diamonds had been stolen not from Mrs but from Miss Harrington's dressing-case, and that further revelations might be made. Morris, however, perhaps in the hope of using her knowledge for the purpose of extorting blackmail from her late mistress when her term of penal servitude was over, discreetly held her tongue; and therefore only Mr Lynx, Gladys, and Ralph knew the whole story of the Harrington Hall burglary. Many of the details could only be surmised, but it seemed probable that Morris, in passing through the shrubbery on her way to the stables, had overheard the conversation between the lovers, and perceiving that even if she were found out, how unlikely it was her mistress would venture to prosecute her for the theft, had conceived the daring idea of abstracting the necklace from Miss Harrington's dressing-case.

Yet another retribution was in store for the unhappy Mrs Harrington. Gladys suddenly assumed a violently bellicose attitude towards her step-mother, and threatened to tell the true story of the robbery to her guardian, Lord Roseford—a gentleman who was universally respected in the county for his almost fastidious ideas of honour.

'You have shown no mercy to me; I will show none to you. Give your formal consent to my marriage with Ralph, and I promise to keep your wicked secret. If you refuse, I will go straight to Lord Roseford and beg him to find some other home for me than Harrington Hall.'

'You undutiful child, how dare you speak to me so!' moaned Mrs Harrington, quailing before the flashing eyes of her step-daughter.

'It is your own fault. If you had not tried to ruin the man I love, I would have waited

three years for him. Now, I mean to marry him in three weeks.'

What could the unhappy woman do? Gladys was thoroughly roused; she was quite capable of making an *esclandre* that would be the talk of Grass-shire for years.

In the end Mrs Harrington did what most women in her position would have done—gave in; and Gladys kept her word. Three weeks later the following advertisement appeared in the first column of the *Times*: 'On the 17th July, at Harrington, RALPH CUNNINGHAM, M.A., late Fellow of St John's College, Oxon., to GLADYS, only daughter of the late Giles Harrington of Harrington Hall, Grass-shire.'

And Mrs Lamprey said to Mrs Smalman: 'What a dreadful *mésalliance*; but I always knew what would be the result of Mrs Harrington's imprudence in throwing that Mr Cunningham with poor, dear headstrong Gladys!'

SOME OLD TAVERN WAYS.

Shall I not take mine ease in mine inn?

THE spread of luxury and comfort, so strikingly apparent nowadays, is nowhere more so than in those establishments which take the place of the inns and hostleries wherein our forefathers tossed off their sack and canary, swore royster-ing oaths, and exchanged many a broken head. The modern 'restaurant' or 'wine-bar,' or even plain 'public' with its garish mahogany, stained-glass and gilding, its plenitude of tankards and glasses, its imposing array of gas-lamps, or it may be electric light, and last, but by no means least, its bevy of sirens skilled in the arts which captivate the lounge, are strikingly different from the old-world tavern with its gable roof, innumerable apartments, paucity of furniture, and busy lads in white aprons. Our ancestors were evidently made of sterner stuff. They went to a tavern to drink, and cared little for surroundings provided the wine were good and the service ready. Take for example, the inventory of the 'stock in trade and furniture of a tavern in Bishopsgate' in 1612, a house boasting the appropriate sign of 'The Mouth,' and a very thirsty mouth too, no doubt. First come the drinkables: '7 hhds. of Orliance wine, £17, 10s.; 1 butte of Malligo, £17; 1 runlett of sherry sacke containing 16 gallonde, 32s.; 1 hhd. of old clarett, 16s.; 2 dusson and 8 bottles of ale, 5s. 8d.;' and so forth. Next the contents of the various rooms: 'The Percullis: 1 long table with a florine, one oyster table, one little cubbord table and one court cubbord, one old wyne stoole, and a payre of playing-tables, 24s. 8d. The Pomgranatt: 1 olde table with a florine, 3s. 4d. The Three Tuns: 1 little standynge carpenters table with 2 stooles, 2s.;' and so on, with little variation through the 'Crosse Keys,' 'The Wyne,' 'The Kings Head,' and other chambers. The 'boarded partitions' belonging to these apartments are valued at 20s.; but in strange contrast to these beggarly appointments we read of '15 small drinkyng bowles of silver, one brode bowle and 2 beakers, one greate saulte, a trencher saulte and 2 silver spoones weighing 154 ozs. at 3s. 10d., £37, 4s. 4d.'

To sit on a hard bench in a room whose sole

remaining furniture was an equally bare and unsightly table, and drink out of silver goblets, strikes one to-day as a strange anomaly. In 'The Barre' are found the measures of the hostelry: '2 gallon pottes, 5 pottle pottes, nyne quarte pottes, 8 pynte pottes, one half-pint potte and a gylle potte.' Only one solitary half-pint measure to nine of a quart capacity! Truly, an indication that 'short drinks' were not much in favour with the gallants who frequented the 'Mouthe,' swaggering in with a clatter and noise much at variance with the semi-maudlin state in which, if contemporary chroniclers are to be trusted, they staggered out again after their repeated potations.

The custom of naming the different rooms is familiar to all who have read our Elizabethan writers. Who does not at once recall those immortal scenes at the 'Boar's Head' in which that magnificent old scoundrel Jack Falstaff played so prominent a part? How the madcap Prince and his companion Poinso so sadly perplexed the unfortunate Francis with his everlasting 'Anon, anon, sir,' and his interjected orders to 'Look down into the Pomegranate.' It was customary, it seems, to have small windows or loopholes between the various apartments, for what reason it were perhaps hard to say, unless to facilitate that interchange of compliments customary between parties who were using different chambers in the same tavern. These courtesies usually took the form of the present of a piece of sugar wrapped up in white paper which the waiters kept ready to hand. Our forefathers were fond of correcting the acidity of their wine by this addition, and it was quite the correct thing to send by the drawer one of these packets to the neighbouring apartment if any friends or acquaintances were there.

There is a story anent 'Rare Ben Jonson' worth giving here. He was at a tavern when Bishop Corbet came into the next room. Ben called for a quart of *raw* wine, and gave it to the tapster: 'Sirrah,' says he, 'carry this to the gentleman in the next chamber, and tell him I sacrifice my service to him.' The fellow did so. 'Friend,' says Corbet, 'I thank him for his love; but prithee tell him from me that he is mistaken, for sacrifices are always burnt'—an allusion, of course, to the practice of heating wine, so frequently met with at this time. The spectacle of the bishop and the playwright exchanging compliments and bandying jokes in a tavern shows that the union of 'Church and Stage' was not such a far-off dream even in those early days. Manners differ, however; and it is scarcely likely that we shall hear of the Bishop of London and Mr Irving discussing the question over a bottle of wine at a Strand bar.

It seems to have been expedient, if not necessary, to cultivate a certain acquaintance, not to say familiarity, with the 'drawers'—attendants whose duty, as is obvious from their title, was originally to draw the wine from the casks, but who were probably after a time merely waiters, fetching and carrying to and from the cellar. Dekker, in his *Gull's Hornbook*, says: 'Your first compliment shall be to grow inwardly acquainted with the drawers to learn their names and dive into their inclinations. The use which you shall make of this familiarity is, that if you want

money five or six days together, you may still pay the reckoning with the most gentlemanlike language: "Boy, fetch me money from the bar." Does not Prince Hal declare: 'Sirrah, I am sworn brother to a leash of drawers, and can call them all by their Christian names. They call drinking deep, dying scarlet. But sweet Ned, to sweeten which name of Ned I give thee this pennyworth of sugar, clapped even now into my hand by an under-skinker.' Bishop Earle, in that curious little collection of satires which he calls *Micro-cosmographie*, has a satirical word to say of the tavern and its attributes. 'The drawers are the civilest people in it, men of good *bringing up*, and howsoever we esteem of them, none can boast more justly of their *high calling*.' He is very severe, though not unduly so, judging from many other accounts we have of the habits of Jacobean times. 'The tavern is a degree above an alehouse, where men are drunke with more credit and apologie. It is a broacher of more *newes* than hogs-heads, and more jests than *newes*, which are sukt up here by some spungie braine. Men come here to make merry, but indeed make a noise. A melancholy man would finde heere matter to worke upon to see heads as brittle as glasses, and often broken. A house of sinne you may call it, but not a house of darknesse, for the candles are never out.'

What was chiefly drunk in these bare and comfortless rooms, with more mirth and laughter perchance than accompany our more decorous meetings? Sack—that favourite beverage, whose identity has puzzled almost every commentator on the period—of course comes first. The word at once brings before us the 'fat knight,' that mountain of ribaldry and wit, who towers above all his compeers on a footing not to be easily shaken; dissolute, dishonest, unctuous, plausible, yet withal jolly and lovable Jack Falstaff. He seems to have been everlastingly imbibing sack. Was he not tauntingly called 'Sir John Sack-and-Sugar?' (An epithet, by the way, bestowed in certain parts of the country on an evil spirit in the times when witchcraft and devilry were believed in.) Did not the tavern bill surreptitiously abstracted from his pocket contain nearly eight shillings debited to the account of his favourite beverage, while bread was ignominiously dismissed for a solitary halfpenny! 'Oh, monstrous,' indeed.

What, then, was this 'sack?' From the constant mention of sugar in connection therewith, one may not unnaturally conclude it to have been an acid wine; but beyond this, there is little to go by. Its price some two years after Shakespeare's death was, according to Peacham, two shillings a quart; but its precise character seems veiled in obscurity as thick as the fumes to which it doubtless often gave rise in the craniums of too ardent devotees. We know that the Bard has committed an anachronism in allowing Falstaff sack at all, since, until the time of Henry VIII., the vintners sold no wines but 'white and claret,' all others being dispensed by the apothecary for medicine. This, however, is but a trifle compared with the gain we have in those glorious scenes from which we have quoted. It has been supposed to be a corruption of *vin sec*; or so called from being carried in a sack, 'as the Spaniards do;' or, according to Ritson, 'a liquor

compounded of sherry, cider, and sugar.' But whatever it may have been—and space precludes such discussion here—certain it is that it held high favour for generations, and quenched the thirst of many a noble gentleman and many a ruffling blade from Tudor to Stuart. Claret, Alicante, Brown, Bastard, were all favourite drinks of the time, the first-named apparently little esteemed, judging from the low price.

The use of sugar and spices with wine was not confined to sack. Our worthy ancestors were very sweet-toothed old fellows, and loved to modify the taste of the grape by infusing all manner of appetising accessories. Here are a couple of receipts for compounding tasty beverages, both taken from an unpublished manuscript of 1611: 'Raw wine prepared with honey and spices, called Clared, is made often of ten parts of whyte wine, one part of honey with a sufficient quantitie of cinnamone and ginger.'—'Raw wine prepared with sugar and spices, called *Vinum Hippocraticum*, commonly Hippocras, is usually made of ten parts black wyne, five of white, one of sugar, cinnamon, ginger, cloves, and a little musk(!). This kynde of artificiall wyne is a very pleasant drink, and is to be drunk after meat.' What digestions they must have had!

But such devices were legitimate, and indeed looked for. The tavern customer of the seventeenth century liked to have his palate tickled by these mysterious concoctions; what he did not bargain for were some of the nefarious and artful manœuvres resorted to by the unscrupulous vintner, of which we will briefly notice a few. Does not our old friend the hero of Gadshill exclaim with indignant emphasis: 'Here's lime in this sack too! There is nothing but roguery to be found in villainous man.' Putting lime into the wine seems to have been a pretty constant practice, as one finds it frequently referred to by the old authors. Sir Richard Hawkins notices the fact that 'since Spanish wyne came into vogue, they are for conservation mixed with lime;' which caused dropsy and other dire disorders, not forgetting our old enemy 'the gouttes.' It seems also to have been used with ale, judging from Robert Greene's remark that 'a Christian exhortation to Mother Bunch would not have been amiss, that she should not mixe lime with her ale to make it mightie.' When Bardolph desired an engagement as tapster from Dame Quickly, do we not remember that he quoted in his own favour his ability in 'frothing and liming?' the former process consisting in surreptitiously introducing a modicum of soap into the glass or tankard, in order to produce a goodly 'head' on the liquor.

But these are by no means all the dodges practised on unwary tipplers. There is extant a curious little tract of great rarity, called: 'In Vino Veritas, or a Conference betwixt Chip the Cooper and Dash the Drawer, discovering some Secrets in the Wine-brewing Trade,' which, though somewhat later in date (1698) than the period we have been glancing at, may serve as a fairly accurate picture of the state of affairs for some time previous to its publication. Under the influence of the contents of their master's cellar, these two gentlemen give some very instructive and curious hints as to the mysteries of their craft. We learn how good

wine was 'lowered' and eked out with 'Freeze, a sorry cider;' how raw beef was thrown into 'fretting wines' for them to feed upon; how a 'Brother of ours that lives not far from Ludgate Church, boasted that he had drawn Champagne, Burgundy, Chablais, and other curious and costly wines out of the very same cask!'—a feat reminding us of the conjuring entertainments of our boyhood, when that wonderful gentleman in evening dress poured all sorts of liquors from a single bottle.

Then, too, it seems to have been the custom to 'tip' the drawer a few pence to procure better wine, 'whereas, alas! we must draw such as our master orders;' so the too generous drinker might have kept his money for some better purpose; and no wonder the speaker confesses that 'a brazen face is essentially necessary to our profession,' and that 'we drawers laugh loud and long at those poor animals that resort to our houses.'

To give the vintner his due, however, we must take it that his customers also had their faults, and that the trade was not without its drawbacks. Dekker's advice, that 'no man counterfeit himself drunk to free his purse from the danger of the shot,' points to a rather shabby custom of trying to obtain refreshment at the very low price of nothing, a custom prevalent, he says, 'amongst gentlemen.' It is to be feared he was rather a bad judge of the article. He gives two other admonitions—namely, 'Not to look at the bill, look only at the total;' and 'At your departure, to kiss mine hostess or to accept the courtesy of the cellar' (that is, a complimentary glass); with which recollection of social amenities as practised in the days of King James, we take our leave of the subject and close these notes.

THE OLD STUDIO.

By THOMAS ST E. HAKE.

IN THREE CHAPTERS.—CHAP. I. THE MASTER.

A CERTAIN house, standing on the Thames' bank above Battersea Reach, was a noted landmark for many years. From its pointed gables and stacks of crooked chimneys, down to its terrace by the river-side, it showed signs of antiquity, and with it neglect. There were deep cracks and wrinkles in the brick walls; and the terrace balustrade was crumbling, like a row of old teeth, and fast falling to decay. A green mossy coating covered the stonework; and in the crevices there were weeds and coarse blades of grass. At the corner of the terrace was a notice-board leaning over the water as on crutches; and upon this board was written, in washed-out letters, 'To be Let on Lease.' With the light of the sunset upon it, exposing all these weak points to view, the house would scarcely seem to have a long lease to run. Its windows were thickly coated with dust, except the two large terrace windows. These were as scrupulously clean as the spectacles on the face of an old person.

When the sun had set and the remaining light upon the river was fast ebbing like the tide, these terrace windows were thrown open. The interior, as it now appeared, was a large and lofty studio—a studio crowded with pictures—some in their frames and some without; some turned towards

the walls; and others partly hidden by pieces of antique furniture and statuettes. Standing in the midst of this *débris* was a tall handsome man of forty or forty-five. His sensitive face—indeed, his whole attitude—showed him to be deeply absorbed in giving the last touches, with hand and soul, to the life-size picture of a young girl. His look was fervent: it expressed something more than artistic ardour for the work almost achieved. He seemed to worship the picture as much as though there were actual life in the eyes, half shadowed by their own dark lashes; in the half-parted lips that seemed on the point of speaking. The pretty head in this painting was thrown back, and rested on the high arm of an old chair into which the girl had sunk. The hands were clasped behind the head, and the white arms were half hidden by the masses of auburn hair. This figure was so delicately draped, so masterfully conceived in every detail of light and shadow, that it seemed to symbolise the twilight that still lay in the western sky.

The last touch had been given; the brush had been thrown aside. A troubled look now came over the artist's face. He turned his eyes towards a corner of the room where a quantity of drapery was arranged, where a quaint oaken chair stood in the foreground with tigers' skins lying about. It was the look of one who saw something beyond the old chair and the drapery around it: it was the look of the poet who in his fancy had placed the figure there, just as it reposed in the painting before him. He stood with his head bent and with a look of tears in his eyes before this empty chair, as though something that he loved was gone out of his life and yet was in some way present. A knock at the hall door startled him. It was now dark, and he hastened to light the chandelier and to draw the heavy curtains across the windows. This done—though not before the knock had been repeated—he went out to open the door. A young fellow came quickly in, and received a warm welcome from the artist. As they crossed the hall—a dark echoing place, with a great winding staircase—the artist placed an arresting hand playfully on his friend's shoulder and said: 'Stay, Fenwick; not so fast. You are always so impatient'—

'Of course I am, Millward,' was the reply. 'I have come on purpose to'—Fenwick stopped abruptly; they had entered the studio while speaking, and the picture had caught his eye.

'Who is she?' Fenwick said at last, and in a tone almost of supplication, as he glanced at the artist and then round the room.

A slight shade came over Millward's face, but he made no answer.

'I recognise her,' Fenwick went on, his eyes resting once more upon Millward's painting, 'in nearly all your pictures; and I have often asked you who she is.—Ah!' he added, laughingly, 'she's some lady of title, I suspect—some lovely princess, whose incognita you have sworn to preserve; for you seldom show any one except me any work that has this face in it!—Have I made a shrewd guess this time?'

Millward shook his head and drew a deep sigh, which he made no effort to conceal.

'Then why not introduce me to your beautiful model? Why, she must have been here a thousand times! How is it I've never seen her?'

Millward laughed in rather an odd way, as Fenwick thought, and raising the window-curtain, looked out eagerly upon the river, but only for a moment. Sinking back into a seat, he replied: 'My dear Fenwick, what motive could I have for keeping you and any model of mine apart?'

Fenwick was on the point of answering, when the sound of oars on the river, close under the window, reached his ear. Millward had risen, and again drawing a fold of the curtain aside, glanced out, and then turned to his friend. 'Excuse my leaving you,' said he, hurriedly. 'It's old Gunning come to take me on the river.'

'You won't be long?'

'No.'

'Then I'll amuse myself while you're away,' said Fenwick, 'by studying your picture.' He threw himself as he spoke into a chair in front of Millward's painting and lit a cigarette. 'By the bye,' he added in his laughing way, 'why not bring back the model with you?'

He regretted his words the moment they were uttered, they appeared to produce such a painful effect upon Millward. His face grew deeply troubled; he looked round the studio distractedly, tried to speak, then turning away, went quickly out.

Fenwick watched him cross the terrace. It was now bright moonlight on the river. A boat had dropped alongside, and a man who looked like an old sailor was securing the boat against the strong ebb-tide. Millward took his place in the stern, and the boatman began to pull up stream. Fenwick noticed that his friend looked eagerly about him as the skiff made gradual way against the current. Re-entering the studio and again seating himself before the picture, Fenwick looked at it long and earnestly.

For some years past John Fenwick had been Millward's pupil; and ever since the day he had come to him, and had caught glimpses of this lovely face peeping out among the many pictures that had always crowded the studio, he had felt great curiosity about the original. But the pupil could never persuade the master by any device to even speak of this model; and Fenwick would long ago have been convinced that the model had no existence—none outside the artist's brain—had not some new picture periodically filled him with wonder and unutterable delight. For Millward constantly reproduced her, not only with all the maturing beauty of face and form—just as a young girl would mature as days went by—but he seemed to gain greater mastery over his art. The girl that Fenwick now looked upon in this picture was a maiden of twenty or twenty-one, in all the perfection of her womanly beauty. But a strange surmise—a very strange one on Fenwick's part—had suddenly come to him. He had often watched the master, when he knew him to be too deeply abstracted to be conscious of being observed, giving some life-touch to a painting of this mystic girl; and then it was that the thought flashed upon him, as Millward's far-off look would return to the canvas, that the spirit of this beautiful model was in the studio, visible only to the master.

Fenwick sat there, before the painting, pondering these things. If he could but conjure up such a vision—if such a beautiful shadow-form

would only but once appear to him! This picture of Millward's, this marvellous work, had awakened in him a deeper and more passionate love of art. This was his ideal—the model he sought for everywhere. With such a model to paint from, he might even aspire, some day, to produce a masterpiece, as Millward had done.

He took up a pencil and opened a sketch-book, seized with a sudden and irresistible impulse to make some beginning; and he soon became so absorbed in his work, so impressed with the idea of a spirit-model wandering about in this old studio, that he never heeded when the sound of oars came faintly in from the river. A momentary thought occurred to him that Millward was coming back; but as the sound gradually ceased, the recollection of it also ceased, and this pencil-sketch held possession of his fancy. It was soon finished—an excellent conception, one that might develop on canvas into a work of art in which the master would discover something, perhaps, more than mere promise of future greatness. But how could it ever come to that—ever come within sight of his ambitious design, unless a model comparable with Millward's could be found?

Impossible! He threw down his pencil and sketch-book in despair. He had half risen from his seat with the intention of lighting another cigarette, when a slight movement of the window-curtain caught his eye. In another moment a young and shapely hand, with long expressive fingers, grasped the folds and held them back. And scarcely had Fenwick decided to conceal himself behind one of the numerous objects of art that encumbered the studio, when the curtain was lifted still higher, and the figure of a girl with a face like the one in Millward's picture came timidly in with the moonlight.

AT A NORTH-COUNTRY HORSE-FAIR.

NOTWITHSTANDING the inroads of modern monthly auctions and the facilities of carriage to city markets, the ancient institution of local fairs for the sale of farm-stock of all kinds still survives and flourishes in certain districts of Scotland. Regularly yet, as the accustomed day returns, farmers and dealers from far and near gather at their immemorial place of meeting to do business or to see what is going on. One may wonder how the date is remembered. No advertisement of the approaching function appears to be made; nevertheless, as if by intuition, early on the morning of the wonted day the roads of the neighbourhood begin to be alive with wayfarers of all sorts making for the wonted spot, and the fair never fails. It can be understood how the recurrence of a great gathering like Falkirk Tryst on Stenhousemuir should be memorable enough; some of the stock which appears there for sale has to be on the road for weeks beforehand. But lesser gatherings are attended with as much regularity, and the fact would seem to illustrate how far habit in a quiet existence may become a second nature.

There are sheep-fairs and cattle-fairs and feeding-fairs, the last being a half-yearly market for the engaging of servants. But a character all its own belongs to the horse-fair. Its tone is racier than that of the others, horse-dealing being pro-

verbially a business requiring peculiar shrewdness, and affording plentiful opportunity for sharp practice. Half an hour at a gathering like that of the Moss o' Balloch gives one a glimpse of some curious customs and some odd types of character, with a breath of an atmosphere quite of its own sort.

A noisy scene it is, between the shouting of rustic jockeys, the neighing and trampling of beasts, and the vociferations of the motley crew of camp-followers who manage to make a livelihood at such gatherings in a hundred nondescript ways. One has to keep his eyes about him, or in an unsuspecting moment he may be knocked over and trodden into the turf by some wildly-galloping cart-horse exhibiting its action. Since early morning the constituent parts of the fair have been coming in. First of all, the refreshment vendors—decent innkeepers of the neighbourhood who have obtained a field-license for the day—busied themselves with erecting their canteens of rough boards. Then the amusement providers, some of whom had encamped on the ground all night, began to set up their rough booths and stands of all sorts. Presently the beasts began to arrive, rough-coated nags mostly, in strings of a dozen or twenty, each string led by a wild cateran of a groom, mounted without saddle on one of the steeds. Last and most important, the sellers and possible buyers themselves put in an appearance—old farmers jogging along comfortably behind easy ponies, and young fellows, vain of their turn-out, who endeavoured to come upon the ground with some show and dash—and by eleven o'clock the business of the day is in full swing.

Foremost in the field are the dealers, a race of quick, sly wit, shrewd and voluble, leading a somewhat rough and haphazard life. Worth more, as a rule, than they seem to be, some of these loud-voiced, broad-shouldered men tramping about heavy-shod and whip in hand among their beasts, may be tenants each of half-a-dozen farms, and be able to put upon the market six or seven score horses of all sorts. Each man's turn-out is ranged by itself, generally a motley array. Every other minute some one of the steeds will be picked out from the row and sent trotting, galloping, and capering about the field, to show its paces before a possible customer, a good deal sometimes on a lucky day being made by the ragged hangers-on who act as grooms and jehus. Horses for sale are known by the fact of their wearing rope halters; while a wisp of straw plaited into the tail intimates that an animal has changed owners.

It is somewhat amusing to watch a couple of dealers or a dealer and some bluff old farmer on the point of completing a bargain. The intending purchaser has cautiously gone over the points of the horse—lifting its feet one after another to inspect the hoofs, examining its teeth to make sure of its age, and finally watching it trot and gallop down the field. As the animal is being led back at a walking pace the farmer turns slowly round. The dealer's hand goes up in the air: 'Twenty-five pound! Say the word.' 'Twenty-four,' says the farmer doggedly. 'Split the difference—twenty-four ten and she's yours.' 'Done, then!'

The dealer spits in his palm, and the two men's hands come smack together, the bargain being

completed by that occult proceeding. Forthwith the money is paid, the expectant groom receives his 'consideration,' and the steed is led away by its new owner.

All bargains of course are not quite so promptly concluded. Occasionally the two men will be seen standing for several minutes, each with hand in air ready to seal the transaction, but haggling over the difference of a few shillings, and perhaps doing no business after all. Sometimes, though not so often as might be supposed, an adjournment to one of the neighbouring canteens assists or celebrates the changing hands of stock.

As might be expected, the gentler sex is conspicuous by its absence from the field. Exceptions to the rule, however, there are. A good woman here and there, a widow perhaps, carrying on her husband's farm, may have come to purchase a dairy pony. With skirts tucked well up out of the mud, these managing women, pretty certain as to what they want, may be seen stepping energetically out and in among the animals, taking no advice unless themselves assured of its reason, and by no means getting the worst of a bargain when it comes to actual business.

A few gentlemen's coachmen may be observed making purchases for their masters' stables; and, investors of a very different class, hucksters of the countryside and small 'merchants,' here and there hang about to pick up anything cheap enough for their purpose. One of these, a coal-merchant, one year bought a steed for a pound; but afterwards considered himself badly aggrieved, as he purchased one at next fair for seven-and-sixpence.

But besides the actual sellers and buyers in such a scene, there is always a motley crowd of hangers-on, the peculiar race who make it their business to attend fair after fair in continual succession throughout the country, practising devices of familiar antiquity, and getting a living by their wits anyhow. There is the 'cheap-jack,' whose voice can be heard all day from his cart hectoring his crowd of rustic customers with a strident 'Sold again! 'Alf a crown for the next lot!' who sells or 'gives away' more watches in an afternoon than many jewellers do in six months, and whose rapid transference of hard-earned money from other pockets to his own in exchange for utterly worthless trifles affords a striking illustration of the advantage possessed by brains over mere muscle.

There are shooting-galleries, presided over by young ladies of fascinating aspect, insinuating address, and picturesque if somewhat faded attire—young ladies who, amid all their rude surroundings, are perfectly well able to take care of themselves. 'Aunt Sally' is in evidence in all her glory, ready to undergo any amount of ill-treatment for a modest consideration, even rewarding, woman-like, her most skilful attackers with gifts of brown-paper cigars and other valuables. There is the invariable cocoa-nut man, ever ready to demonstrate the ease with which a nut may be thrown through the hole in his board, and equally ready with a consolatory and encouraging word to his customers when they miss. And wandering minstrels of all sorts—tatterdemalion pipers, fiddlers, and penny-whistle players—seeking to inspire at once the patriotism and

the generosity of the crowd, are to be both seen and heard about the field.

Naturally at a horse-fair there is not so great a gathering of the showman element as at a feeing-fair, the great patrons of the shows, the farm-servants, being present in fewer numbers, the inspiring influence of their sweethearts being lacking, and the occasion altogether being a less jovial one. Nevertheless, somehow, a sprinkling of the minor caterers of amusement always appears, and without the presence of these the function would want one of its characteristic features.

A strange rude life they lead, these Bohemians of the hedgeside and the country byways; and the peep behind the scenes which is here and there afforded by their rough-and-ready camping arrangements suggests curious speculation upon the advantages of a contented spirit. Something of romance still lingers about these people and their ways. Among them yet, mingling with the various flotsam and jetsam of civilisation, is to be found a remnant of the Ishmael Romany, that dreamy-blooded, passion-haunted race, doomed to wander the earth with a destiny unfulfilled and to disappear. And under the primitive rag tent and within the curious houses on wheels lingers yet in actual fact the material of many a strange story.

People travel far to east and west every year to study types and manners; but in many a corner like this near home, if time were given to the study of it, it would still be possible to discover things sufficiently quaint, interesting, and suggestive.

A SUMMER SOLITUDE.

BROAD slopes, robed regally in purple ling,
Where green moist moss and scented thyme lie hid;
And harebells hang the wind-stirred grass amid;
And ferns and foxgloves fringe the peat-stained spring.

Here flames a yellow tuft of furze, and there,
A narrow patch of vivid colour shows
The ant-built hillocks where the cistus grows;
And ruddy bracken starts up everywhere.

The scattered sheep stray singly o'er the waste;
Above, the plover sounds his plaintive pipe;
Out yonder rise a pair of startled snipe,
And seek fresh shelter with a timid haste.

And far out west there gleams the wide gray main—
A silver glory where the sun-sprite spills
His subtle charm—and 'neath the northern hills
Faint smoke goes up of cities of the plain.

A silent solemn place and holy ground,
Where God speaks in a still small voice, which they
Hear not who hurry by; but those who stay,
And hearken, catch the tender whispered sound,

And hearing, gain a strange, strong peace of heart;
A new sweet patience for the pains of life;
A calmer courage for its stern fierce strife;
A conscious power to do a nobler part.

LESSONS, MY DEARS!

BY MRS WALFORD.

A FAMILIAR figure of the present day is the pale-faced, lanky, all-shoulder-and-elbow school-girl just entering her teens. Her frocks are in a chronic state of requiring new 'false hems'—the modern substitute for the tucks to be let down, which were the bane of the last generation—and between her faintly-discernible waist and obtrusive waistband there exists a vast and hopeless gulf. She is tolerably sure to have cold feet and hands. She almost invariably runs to a pink nose, if not to pink eyelids. Usually, she is rather silent. If not haunted by the ghosts of Lessons past, she is brooding over the looming shadows of Lessons to come; if not chewing the cud of good or bad marks already received, she ponders deeply over what of these the future may have in store. Away from the desk or the piano she has no real existence.

Moreover, as her mind seldom wanders outside the narrow precincts which bound her own little world, she is—unless possessed of an exceptionally forcible character—still less of a listener than a talker.

See her at the luncheon table, for instance. At luncheon she appears; it is her dinner, and too often her one solid meal in the day—but it is not honest hunger—would it were!—which prevents her finding anything worthy of her attention in the conversation held by her elders. We will suppose—it is rather a wild supposition, but still it does sometimes happen that the luncheon table is the centre of really interesting talk on notable topics—we will suppose that it has chanced to become so on an occasion; does our solemn-visaged little wiseacre pay any heed to what is being said? Not a bit of her. It is not her business. She has not been given that conversation to learn; and she is stolidly averse towards acquiring knowledge in any other form than through the legitimate channel of

her daily tasks. Those she has got to worry through, and that is enough for her.

Enough? It is a vast deal too much, and that is the simple truth about the matter. The poor little head and brain are already fully charged to the brim—the intelligence as it were met and provided for. The girl is being 'taught' everything, and nothing is left for her to learn of herself. Is it likely that she can manifest the slightest desire to put forth hand or foot in devising paths on her own account, when she is being made to march in the regulation step from morn to night along the hard highway?

She is 'being educated'—that is to say, she has been put into a mortar and is being pestled into shape. From that shape every original bias has to be eliminated. It is like the gristle which the careful cook picks out and throws away when mincing her beef; your true-born *chef* wants none of it, neither does the parent nor guardian want any girl-gristle; they want a nicely minced-up young lady, moulded to pattern. All extraneous interests, all curiosity regarding the great world or its ways, all unorthodox sympathies, all special yearnings and aspirations, come under the head of 'gristle' in the process now being gone through—in the drone, drone, drone of 'Lessons' from one hour to another.

'Lessons, my dears,' is read in the eye of the governess, as morning by morning she sails out of the dining-room at the conclusion of family prayers; and 'Lessons, my dears,' the same eye announces again in the first pause at the close of the luncheon-dinner. Meekly the poor preceptress departs, and meekly follow the little flock. *They* have no digestions to be considered; no pause for health's or pleasure's sake need be thought of for *them*.

Oh yes; they have their daily walk—an hour in the morning, an hour in the afternoon; perhaps in the summer-time they may even stroll outside again in the cool of the evening. But Lessons must be *first*, of course. So says mamma,

with calm unconscious air. Your British matron is so very unconscious, so absolutely innocent of committing the very slightest offence against her own flesh and blood, nay, she is so entirely convinced that she is doing the very best she can for them in every possible way, by thus ordaining and inculcating the doctrine that 'Lessons must be first, of course; that it is almost a hopeless task to endeavour to undeceive her.

Lessons must be first—before everything. Well, perhaps not before religion; but certainly before food, exercise, fresh air, sleep. The drowsy head must be shaken up from the pillow at an early hour—long before papa, or mamma, or any elder folks in the house are astir; and the fretful, shivering, starved, and only half-roused school-girl set to practise in a room in which, if it be mid-winter, a fire has just been lighted; or at other seasons has not been lit at all! In some exceptionally careful households there may be accorded before this ordeal a glass of milk—cold and heavy on the stomach at that hour; but the good, warm, nourishing breakfast which should always precede brain-work in the case of every growing girl, is either delayed until she has accomplished her hour's study, or not given at all. The mind is gorged—the body is starved.

And so on throughout the day. The parent who considers that during the brief hours of winter sunshine it is as well to curtail the morning tasks to a single hour or so, and postpone the principal tuition to the afternoon, by which time the sky is apt to cloud over and raw mists to steal over the face of the land, has, in the eyes of her acquaintances who are *educationists* proper, a very poor idea of developing mental culture. They 'wonder at her'—behind backs. They consider she 'does not do her daughters justice.' And one speaker will narrate how many hours a day her dear girls are closeted with their 'Fräulein;' and another will cap the recital with the extra dose administered by her 'Mademoiselle;' while the pale drawn faces and the round stooping backs of the unfortunate objects of their tenderness, count for nothing as compared with Adela's proficiency in music, or Ethel's fluency in French.

The doctor, he knows. He knows the meaning of those listless movements and lack-lustre eyes. But of what avail is his knowledge? He may gently hint at the necessity of the chest expanding and the muscles developing; but he will be met by the cold rejoinder, 'My daughters have abundance of exercise; they have a backboard in the schoolroom: they are not great eaters by nature!'

It is hard in the teeth of 'Lessons, my dears,' which is written on every line of the matron's visage, to insist on it that the slow, formal walk is *not* exercise, that the backboard is *not* rest, that healthy hunger has to be inaugurated—sown, as it were—and is not a genuine product of poor enfeebled soil.

Now, that the girl in her teens has much to learn, and that she has arrived at the age for receiving instruction, no one will think of denying. She ought undoubtedly to get rid of a certain amount of ignorance through the direct medium of schoolroom routine; but may a word be here put forth to suggest that it is but a very

small portion of knowledge which can be deliberately, as it were, injected into the young, and that the real, the useful, the principal lessons they need, and by which their future lives will be guided, are not to be found under the head of 'Lessons, my dears?'

A girl ought to be taught to think, to observe, to reflect; but if she is given no time wherein to exercise these powers, if every day and every hour is so filled up, so portioned out, and so settled for her by authority, how is she ever, in homely phrase, to 'feel her feet?' Her powers both of mind and of body are undermined by the constant wear and tear of endless tasks. She is enfeebled and incapacitated. Her faculties are warped. Intelligence itself, when driven between the shafts unceasingly along one beaten track, will cease to gaze with any interest elsewhere. Turned loose upon a common full of flowers and grasses, the same becomes straightway no better than a wilderness.

Holidays bring but a partial benefit in the above cases. The body may recuperate itself, but the mind cannot. What is the little maid to do? How shall she pass the time? She cannot be always at play; she wearies of doing nothing; yet she has no energy for doing anything. To read would be purest drudgery: to draw, to sing, to cultivate a single accomplishment would all savour of the hated 'Lesson' hours. She can fancy nothing—settle to nothing.

Hard-worked and hard-driven as she has been throughout her young career, she has never been taught one thing, and that is to *employ herself*; with her it has ever been either 'Lessons, my dears,' or else—idleness.

Is there anything to be done? There is this. Curtail the hours during which schoolroom rule is all in all. Permit some intervals of real leisure—not enforcing *anything* to be done in these. Leave them to be dealt with by their owner herself. Surely she has a right to own some little bits of her own life here and there. When not worn out by ceaseless tasks, she will fill them sensibly enough, if she is a sensible child; and if not, she will at least fill them as well as you, her guardian, could do in such a case. Don't take all the 'go' out of her with endless supervision. She wants to go her own way and follow her own bent, at times. Consider that the time will come when she will *have* to do this, and why not prepare and train for such a time? You will not always be at her elbow; draw away from it once in a while, now.

And as for that eternal 'practising,' can anything be said to check or moderate this pest? In how few cases is there any real result; how few are musicians by nature.

It may of course be replied to this that even a little musical ability may be useful in after-life, may cultivate the ear, and teach appreciation, if nothing else. Granted, but that is not the point. Enough musical tuition to acquire these can be surely gained without hours and hours spent in drumming scales, and rendering and re-rendering difficult passages of 'pieces' never destined to delight any mortal ear. It makes one's heart ache to see the victim to these going through her daily drudgery, and to know how valueless it is.

As for the hideous folly of enacting that it

shall be gone through fasting, and at an hour of the day when Nature is at her lowest ebb, requiring a fillip instead of a drain, this is a matter which requires stronger language and more eloquent denunciation than the present writer dares to give.

DUMARESQ'S DAUGHTER.

CHAPTER XXVII.—MEDICAL OPINION.

THE great London doctor to whom Haviland Dumaresq submitted his case in due form next day, shook his head gravely when the famous thinker detailed his symptoms to him with some very small mental reservations. For we none of us tell the whole truth to doctors. Even a philosopher can hardly be trusted to make a clean breast of it to his medical adviser; and Dumaresq, though he admitted in part the opium, glided gently and gracefully over that painful part of the subject. But Sir Anthony Wraxall (for it was no less a man than that celebrated physician) didn't need to be told to what extent his patient had persevered in the baneful practice. 'Even you, Mr Dumaresq,' he said with a smile, 'who know so well how to regulate the lives of all the rest of us, can't be trusted at a pinch to regulate your own! Why, I quote you every day to my lady patients as the great authority on these questions of nerve; yet your own nerves have gone to pieces bodily. "Physician, heal thyself," is a very old cry. I feel its sting myself.—Well, well, we must see what we can manage to do for you.'

'Not much,' Haviland Dumaresq answered gloomily.

Sir Anthony gazed hard at him from those keen small eyes of his—eyes like a ferret's, overhung with the heavy black beetling eyebrows,—eyes that seemed to peer through you outright into the profoundest depths and recesses of your being. 'You're right,' he answered. 'Quite true, Mr Dumaresq. With you I may drop professional reserve. No use in prophesying smooth things to the thinker who worked out the scheme of the Encyclopædic Philosophy. I won't pretend to give you the little prescription which in rather less than no time will make another man of you. You're very well aware that broken-down machines can't be restored by pouring a few drops of oil on their bearings. You're one of us in all essentials, and you know far more about your own case, no doubt, than all the rest of us put together. I can only aid you by my diagnosis. And I'm afraid I can tell you very little in that respect that's likely to please you.'

Haviland Dumaresq's lip trembled. It was curious to him to note, however, even in this moment of deep despondency, how much more everybody thought of himself and his work in proportion as they approached nearer to his own high level. A country doctor would have treated him at best (if indeed he knew the cosmical philosopher's name at all) as a mere dabbler with some superficial knowledge of animal physiology: Sir Anthony Wraxall, the greatest London consultant of his day, treated him at least with the deepest respect as a high collateral authority on

his own subject. Dumaresq smiled a grim smile of satisfied appreciation. Recognition is dear to the very greatest of men. 'I thought as much,' he answered, in his calm impassive way. 'I felt, myself, things couldn't go on like this much longer. The machine's worn out, you say. Then you don't hold out much hope for my life? The mechanism can't work at such low pressure for any time worth speaking of without stopping altogether.'

Sir Anthony Wraxall shook his head ominously. 'Not for three months certainly,' he said, 'if you still continue to ply it with opium.'

'But I've left off opium,' Dumaresq answered with perfect confidence.

'Since when?' Sir Anthony asked, peering deeply once more into his patient's widely dilated pupils, which still bore evidence of a recent overdose.

'Since yesterday,' Dumaresq replied in his coldest tone and with consummate gravity.

If any other man had said such a thing to him, Sir Anthony Wraxall would have laughed outright, and been amply justified in so laughing. But the voice in which Dumaresq uttered those simple words, with all the earnestness of his stoical nature, meant a great deal; and Sir Anthony understood it. 'I see,' the great consultant answered with a very grave face. 'You have promised, no doubt?'

And Dumaresq, nodding his gray head solemnly, made answer with infinite weight: 'I have promised.'

'In that case,' Sir Anthony said more cheerfully, taking it for granted at once from the man's mere look that the resolve was enough, and that Dumaresq would do exactly as he intended, 'I think I can guarantee you, with moderate care and a change of climate, from eighteen months' to three years' respite.'

Dumaresq's face was statuesque in its repose; he never changed colour or moved a muscle. If sentence of death had been pronounced for that day, he would never have betrayed it in his facial expression. But his heart was very sore for poor Psyche, for all that. If he must die so soon—and leave Psyche unmarried—he would feel he had indeed thrown his life away for nothing. But still, three years is a very long time. Much may be done, with energy, in three years. Psyche had still the world to choose from. How many men would be pleased and proud to wed Haviland Dumaresq's daughter, and his guileless Psyche!

'What climate?' he asked with Spartan brevity, sparing his emotions, to economise the great doctor's rigid quarter-hour.

Sir Anthony rubbed his hands together reflectively, as if grinding out wisdom from his palms between them. 'What you want,' he said with oracular calm, 'is rest, change, variety, an open-air life, sun, sea, and freedom. "The palms and temples of the South," you know, and all that sort of thing; you languish for the purple seas, as our other great man has somewhere phrased it. The Riviera's not exactly the place for you; overdone, overdone; too much noise and bustle and vulgarity. What you want, with your highly-strung nervous temperament, and your wide delight in natural contemplation, is Egypt or Algiers; quiet, solitude, novelty. The Oriental

world will perhaps be new to you—though you seem to have exhausted universal nature.'

'I have never been in the East in my life,' Dumaresq answered gloomily; for how he was to raise the money to go, without trenching on his tiny reserve for Psyche, he hadn't at that moment the remotest notion.

Sir Anthony's face brightened up. 'That's well,' he said, with professional cheeriness. Your great doctor makes a point of putting the best face on everything. 'The newer the scene, the more likely to suit you. Novelty and stir of Oriental life—camels and Arabs and sands and date-palms—pyramids and temples and sphinxes and Memnons—the bustle of the bazaars, the calm of the desert—that's the kind of thing to rouse and stimulate you. Hire a dahabeeah and go up the Nile; or rent a villa at Mustapha Supérieur. Don't work, don't think, don't write, don't philosophise. Let that teeming brain of yours lie fallow for a while. Ride, drive, play whist, talk gossip, drink tea, skim the *Saturday Review*, or the last new novel—I can recommend Ouida—and don't bother yourself in any way about anything or anybody. A good French cook, generous diet, sound champagne, and a comfortable carriage, will give the machine a new lease of life for an extra twelve months or two years at any rate.—You've been living too sparingly of late, I feel sure. Pulse is low and circulation feeble. Change all that; make yourself comfortable wherever you go, and treat yourself to every luxury you've a mind to.' He snapped his mouth to and looked very wise. 'Tis a professional way of announcing to your patient in polite pantomime that (with a little formality of cash transfer) this interview may now terminate.

As for poor Haviland Dumaresq, in his Spartan poverty, he fingered in his pocket those hard-earned guineas he was to pay so soon for this sapient advice, and wondered to himself where Sir Anthony thought the money was to come from for the dahabeeah and the villa and the comfortable carriage, the champagne and the cook and the generous diet. Did he really believe the Encyclopædic Philosophy was a modern Golconda, or was it a part of his stereotyped professional humbug to treat every patient as a potential Midas? Dumaresq and Psyche had come up to town that morning by third class from Petherton; and by third class they would go down again to their home to-morrow. A dahabeeah was to them as practically unattainable as a royal yacht; a villa at Algiers was as far beyond their means as Windsor Castle or the Winter Palace.

Sir Anthony glanced at him once more with inquiring eyes as he stood there doubtful. 'But mind, no opium!' he added sharply in a sudden afterthought.

The old stoic stared back at him with profound majesty. 'I have spoken,' he said, and made no further answer. Sir Anthony saw his mistake at once, and with practised tact bowed a hasty apology.

Dumaresq laid down the guineas on the table, and went out again to Psyche in the bare little anteroom with his heart very sad and his spirits sinking. He knew, of course, it couldn't possibly be Egypt; but somehow or other he must manage

Algiers. He had only three years left to settle Psyche in! That one thought alone monopolised his soul. No time to waste upon foolish flirtations with penniless painters now! He must find some rich man to make his darling happy!

'What did he recommend, Papa?' Psyche asked, all tremulous, as they went sadly down the steps together.

'Ten thousand a year and a brand-new constitution,' her father answered, with an unwonted touch of cynical bitterness. 'These great doctors are all alike, Psyche. They could cure us at once, if only we'd be millionaires of twenty-five to please them.' And in deference to his medical attendant's advice, he hailed a hansom—an unheard-of luxury—and drove off at once to the famous oculist's.

The famous oculist, in his turn, after examining Psyche's eyes from every possible point of view, dismissed the poor girl herself to the waiting-room, and held back her father with a courteous waive for a moment's consultation. 'Mr Dumaresq,' he said in a very respectful tone, 'of course you know as well as I myself do what's the matter with this poor young lady. It isn't her eyes themselves, properly speaking, that are at fault at all. It's mere functional disuse of the optic centres. The retina and lenses are as right as ninepence. All she needs is to rouse herself—to rouse herself. Internal causes—I call it that. With an effort of will, she could see as well as ever she saw in her life again, I assure you.'

'So I thought,' Haviland Dumaresq answered, still unmoved, but trembling inwardly in every nerve. 'As this is professional, I won't hesitate to mention to you, in strict confidence, that my daughter's affections have been very severely strained of late.'

'I guessed as much,' Dr Godichau replied, letting his *pince-nez* drop with a sudden movement from his eyes gracefully. 'Well, we all know the two best prescriptions medical science can propose for that. First, change of air. Next, change of affections. A new scene, in fact,—and a new lover.'

Haviland Dumaresq drew himself up stiffly. He approved the advice, but not the expression. 'I propose to take my daughter abroad,' he answered somewhat curtly, with his grand air. 'I wish to give her change of scene and fresh ideas. I shall take her out into an unaccustomed society, where she may have opportunities of forgetting her unfortunate fancies, whatever they may have been, and of forming perhaps new friends and new attachments.'

'One nail knocks out another,' Dr Godichau answered with French sententiousness.

Haviland Dumaresq wondered in his own soul why all oculists have invariably a distinct want of sensitiveness. Could it be, he asked himself, because they have so often to operate painfully on the eye, and the eye is the most delicate of human organs? 'Well, I'll try to throw her into fresh surroundings,' he went on coldly, unheeding the specialist's ill-timed remark. 'Sir Anthony Wraxall, whom I've just been consulting on my own account, advises me to spend the winter in Algiers. Would Algiers, do you think, suit my daughter?'

'The very thing!' Dr Godichau exclaimed

with the common medical air of profound conviction. 'What the young lady wants is rousing—taking out of herself: engaging in the concerns of humanity generally. If once you can persuade her to use her eyes—to look about her and feel an interest in things—it'll be all right. Her sight'll come back again. Nothing's more likely to have that result than a totally new Oriental society. At Algiers, she'll be compelled, against her will almost, to look at the Arabs and the mosques and the fresh forms of life that unfold themselves like a panorama before her. The young lady's never been out of Europe, perhaps?—No; I thought not. Then nothing could be so good. I was going to advise a trip to Italy or Spain; but Africa's better, Africa's better. Take her there by all means. And if you can find a new nail to knock out the other, so much the luckier of course: so much the luckier.'

Haviland Dumaresq went back to his shabby little hotel in the Strand that day fully determined in his own mind upon two things: to go to Algiers, though the trip should cost him the savings of a lifetime; and to find that rich husband for Psyche within the next eighteen months, before he himself should be finally incapacitated for providing for her future.

And all this time, the senior partner in the firm of Burehell and Dobbs, family solicitors, was going about London chuckling silently to himself at the untold wealth already potentially possessed, under the will of the late C. A. Linnell, deceased, by that lucky young woman, Miss Psyche Dumaresq.

But as for Psyche herself, she felt almost happy when her father told her they were to go to Algiers, for then she wouldn't be separated for the winter from Geraldine; and Geraldine was now her only confidential and sympathetic friend in her great sorrow.

LAMP OILS.

THE introduction by the Home Secretary of a Bill entitled 'The Inflammable Liquids Bill,' dealing with the storage, transit, and sale of Lamp Oils, has brought into prominence the extraordinary development of the trade in petroleum, paraffin, naphtha, and other hydrocarbons. When Mr Gladstone, in the course of his last visit to Midlothian, inspected the works of the Pumpherston Oil Company, near Uphall, and was shown the method of extracting pure white oil from flinty rock, and of utilising by-products formerly considered waste and unprofitable, he said that in the political world it was common to speak of revolutionary movements, but that when he learned what was being done in industrial centres, he felt the phrase would be much more apposite if applied to the changes continually going on in trade and commerce. The remark is a true one. The growth of national movements, which sometimes culminate in revolutions and the fall of dynasties, undoubtedly attracts more attention than the discovery of a natural law, or the application to the service of humanity of substances of which the great round world is composed;

but in the long run, it is by those who 'scorn delights, and live laborious days' that the most lasting benefits are achieved. It is not necessary to depreciate the labours of others when we claim the laurel wreath for those who in solitary places, or amid the din of industrial life, have worked out great problems, or devised means for increasing the commonweal, and hail them as heroes and benefactors. Caxton, Stevenson, Arkwright, and others are the real revolutionaries; and the works they planned have done more to affect the lives of the people than all the acts of statesmen from Magna Charta to the present day.

We speak of mineral oil as if it were a new discovery. This is only partially accurate. It is certain that its properties were known in the days of Miltiades (490 B.C.); and it is conjectured that it was largely used in times much more remote. In Persia it was employed in the temples of the fire-worshippers and the palaces of the wealthy. Large quantities were sent to distant countries, and an export tax imposed, from which the Government derived a considerable revenue. The legend of the fire which came down from heaven and lit the altars of the Zoroastrians probably had its origin in the discovery of a naphtha spring.

But it is only during the last forty years that the development of the trade in petroleum or rock-oil has taken place. In 1847 the late Dr Young ('Paraffin Young' he was familiarly called) had his attention drawn to a curious liquid exuding from the ground at Alfreton, Derbyshire. He distilled a portion, and obtained an oil suitable for burning in lamps. The supply was soon exhausted; but the experiment he had made led him to believe that a similar product could be obtained from the distillation of coal. A few years later he experimented with a rich gas-coal found near Bathgate. He was successful. It was afterwards proved that other chemists had preceded him; but he was undoubtedly the first to construct apparatus for the manufacture of oil on a commercial scale. In course of time, shale, which had been often met with, but was looked upon as a mineral of no value, was used in place of coal. Since then, the industry has increased by leaps and bounds, and has now become one of the most important in the country.

In 1859 petroleum was discovered in America and Canada. It was obtained in liquid form by boring. Some of the wells were extraordinarily prolific, the oil rushing into the air in a stream so powerful as to defy the control of those engaged in searching for it. One illustration may be given. While drillers were at work, an unexpectedly strong rush of oil occurred. In vain they endeavoured to stem the torrent, which shot into the air in a solid column forty feet high. Every light was promptly extinguished save one, four hundred feet distant, from which no danger was apprehended; but the spirit or benzene, which is always present in crude petroleum, was ignited, and immediately converted the column into a roaring pillar of fire. An appalling catastrophe was the result. Every one within a certain radius was literally burned up. The owner of the well was by the explosion thrown a distance of twenty feet. He was with difficulty rescued, but only lived a few hours.

The experience of thirty years in the oil dis-

tricts has taught drillers how to deal with gushing wells; and accidents which were frequent in the early days of the trade are now scarcely known. In the process of refining, the light inflammable spirit is removed and Lamp Oil thereby rendered comparatively safe. By Act of Parliament all imported petroleum must not flash—that is, give off inflammable vapour—under seventy-three degrees Fahrenheit close test, which is equivalent to one hundred degrees Fahrenheit open test. As the temperature of oil in this country could not under normal conditions reach one hundred degrees Fahrenheit, the risk of explosion is not great. There is, however, danger to be apprehended from the storage of large quantities in populous centres, such as the banks of the Thames and the Mersey. In the event of fire breaking out in one of the warehouses adjoining a petroleum depôt, the consequences might be terrible, particularly as the ordinary means of extinguishing flames are useless when burning oil has to be dealt with.

Thirty-two years ago oil was 'struck' in Pennsylvania. The output was two thousand barrels. In the following year the quantity had increased to five hundred thousand barrels; and a year later to over two million barrels. In 1862 Canada became a producing country with a contribution of nearly twelve thousand barrels. Until about 1870, drilling operations in the States were confined to New York and Pennsylvania, and the output from the wells was five and a quarter million barrels. West Virginia, Ohio, and California then entered the lists; but there is not any reliable information as to output. The combined production from these sources was probably from one hundred and fifty thousand to two hundred thousand barrels yearly. Down to 1882 there was a steady increase in the supply of oil. That year the output from the Pennsylvania and New York wells reached the gigantic total of thirty million barrels, or a daily average of 82,303. It was the culminating point in the history of the trade. The decline was rapid; and in 1888 production had fallen to seventeen million barrels. To many it seemed that the days of American supremacy as an oil-producing country were at an end. Meanwhile, mineral oil had found its way into every European country, and by its superior illuminating power had driven off the field the more costly animal and vegetable oils which, outside large towns, had been in universal use. It had even become a formidable rival to gas, which owes its survival to the ease with which it can be lit. The trouble connected with the filling of lamps and the trimming of wicks is the only reason which has prevented mineral oil from supplanting gas everywhere.

In order to meet the increasing demand of the world for lamp oil, large quantities of petroleum had to be taken from the accumulated stocks held by the pipe-lines. In January 1883 these amounted to thirty-five million barrels. At the close of 1889 they were eleven and a half million barrels, or less than one-third. In 1890 there was a change in the position. The drilling area was enlarged and important additions made to output. The average daily production, which in 1888 had declined to 46,700 barrels, rapidly increased until it touched eighty thousand barrels.

This largely arrested the continuous drain upon stocks, although down to the close of last year the daily supply was never quite equal to the demand.

The immediate effect of the discovery of petroleum was to check the progress of the paraffin-oil trade in Scotland. To drill a well for petroleum was much easier than to sink a pit for shale. The American producer had also the advantage of obtaining his oil distilled; while his Scottish rival required to erect costly retorts and do in an imperfect manner what nature in America had already done in her secret laboratories. In the early days of the trade, high prices were obtained for lamp oil. In 1865 crude petroleum realised eight dollars per barrel. In December 1886 the market value had fallen to a little over two dollars; and in 1879 it was under one dollar. Since that time it has fluctuated between sixty cents and one dollar. As American quotations controlled the price all over the world, Scottish manufacturers found it necessary to reduce the cost of production or retire from the contest. It has been a long and sometimes apparently hopeless struggle against overwhelming odds. In parts of Midlothian and Linlithgowshire the land is covered with mounds of rubbish on which scant patches of grass and weeds are trying to find a home. They are the ruins of what were once brilliant hopes and the mementoes of wasted effort. But still the trade survives; and while the conflict is not yet over, the future is fuller of hope than at any time since 1885.

Second only in importance to the American oil wells are those of Russia. Long before the rich deposits of Pennsylvania were discovered, the naphtha springs of Baku were known and worked. Marco Polo, who visited Armenia about the end of the thirteenth century, tells of a fountain 'whence rises oil in such abundance that a hundred ships might be at once loaded with it. It is not good for eating, but very fit for fuel, for anointing the camels in maladies of the skin, and for other purposes; for which reason people come from a great distance for it, and nothing else is burned in all this country.' At first the oil was put in goatskins and carried on the backs of camels to the villages in the interior. At a later date barrels were used, and in them the oil was shipped from the port of Baku to the towns on the shores of the Caspian Sea. The exploitation of the American oil-fields had the effect of infusing some life into the primitive workers on the peninsula of Apsheron, and of mildly agitating the phlegmatic rulers of Russia. It was not till 1878 that, mainly through the efforts of Mr Nobel, energetic measures were taken to utilise the enormous deposits known to exist in the country. In 1880 the output was three and a quarter million barrels; and two years later it was five million barrels. From that time progress has been great, and during recent years production has nearly equalled that of America. Some of the wells have yielded supplies far in excess of the richest 'gushers' ever drilled in Pennsylvania. From one of them it is estimated the flow was fifty thousand barrels in twenty-four hours. But this was not long maintained, and ultimately it ceased altogether. From Baku to Batoum, on the Black Sea, a railway

has been constructed across the Caucasus—a distance of about six hundred miles—and by means of it the refined oil is conveyed for shipment to Europe on the one hand and to the distant East on the other. A pipe-line has been recently laid a portion of the way, and on its completion the cost of transit will be much reduced.

The greater part of the petroleum exported from America and Russia is carried in tank-steamers. This method was only adopted a few years ago, and is found to be much easier and cheaper than the barrel system. The ocean steamers exclusively engaged in the trade number over seventy; and one hundred and fifty additional are employed in the Caspian Sea. The larger vessels carry from three to five thousand tons. When a steamer arrives in port, the oil is pumped into tanks on shore. The tanks are usually underground, and when properly constructed, reduce the danger from fire to a minimum. Still, the absence of regulations as to their situation and construction is considered unsatisfactory by those responsible for the public safety, and the London County Council and other public bodies have petitioned Government to frame suitable provisions for dealing with the industry. The response of the Home Secretary is the Inflammable Liquids Bill, and he is desirous of having it referred to a Select Committee, who would be empowered to take evidence, and to remove provisions which were shown to be unnecessary, or which would press with undue severity on any section of the trade.

As illustrating the extent of the business in lamp oils, the following figures, which deal exclusively with the United Kingdom, may be interesting. The importations of petroleum and petroleum spirit or naphtha during the years 1888, 1889, and 1890 were—

	Petroleum Oil in Barrels.		
	1888.	1889.	1890.
London.....	892,376	927,365	948,420
Liverpool.....	449,284	501,103	563,972
Bristol.....	163,704	142,683	167,161

Clyde and Leith.....	9,870	21,221	8,045
Dublin.....	...	...	...
Southampton.....	...	...	...
Totals.....	70,456	91,930	99,798

While most of the oil was imported in bulk, the figures given above show the equivalent in barrels. The production of Scotland may be taken at five hundred thousand barrels of oil and spirit combined; and as comparatively little is exported, the gross consumption last year from all sources was nearly two and a half million barrels, or one hundred million gallons. There

are few industries which in the space of forty years can show a progress so marvellous, or have added more to the material well-being of the nation.

THE OLD STUDIO.

CHAPTER II.—THE MODEL.

FENWICK could have scarcely felt more surprise at this lovely apparition, if the girl now before Millward's picture had actually stepped out of the canvas. It was the same face, the figure too, only needing more repose, and a few expressive folds of drapery to perfect the resemblance. Standing before what seemed her own portraiture, and staring at it with a half-indignant recognition of its merits, the girl's eyes were wide open, the lashes curving upwards, the eyebrows slightly elevated, and the lips laughingly apart. After a while, she began to look round the studio with intense interest and wonder. Every painting, statuette, or piece of furniture, of which she could get a glimpse from where she stood, seemed to awaken the liveliest curiosity. Her expression reminded Fenwick of a child in a toyshop greatly puzzled which 'work of art' to play with first. Her eyes rested at last upon some transparent drapery thrown carelessly over the back of the great oak-chair. She took it delicately in both hands, looked at it with a roguish smile and then at the painting. Then laying her hat aside, she flung the gauzy scarf over her shoulders and sank back into the chair, selecting the attitude Millward had chosen for his picture.

Until now, Fenwick had watched her with a dread lest even the sound of his breathing should reach her ear from where he was hidden—where he was studying her pretty features with something more than artistic appreciation in his gaze. Her great beauty—a beauty which surpassed the ideal which had taken shape in his mind from a study of Millward's many paintings—had roused in him unbounded admiration. And if it were possible to fall in love with a face, one that had grown familiar to him on canvas, Fenwick had fallen in love with hers: the face which he had persuaded himself existed only in his friend's brain. And now this picture still more, as it seemed to him, represented merely a beautiful vision; for now that the living model was seated there—the superb reality—the master's great work seemed to want life; and the quaint thought recurred once more to Fenwick that only the disembodied spirit, not the girl herself, could have hitherto inspired Millward in his paintings. This picture, which critics had pronounced to be his master-piece, was only the foreshadowing of a great work: the master-piece had not yet seen the light.

Fenwick could no longer resist the impulse to speak, to express his sense of pleasure. An exclamation escaped him. The spell was now broken: the girl sprang up out of the chair, the drapery uncoiled and fell on the tiger's skin at her feet, and next moment her hand was upon the window-curtain where she had entered not many minutes ago.

'Stay! I am Millward's friend.—Did I frighten you?'

She looked more attentively into his face. The expression of alarm gradually left her: it seemed to change into one of lively recognition. Could she possibly have seen him before?

He wheeled a chair invitingly towards her. 'Mr Millward,' said he, 'will be back soon.'

A shade of uneasiness crossed her face. 'He is still on the river?' She put the question with an eager look for confirmation.

'Yes; with old Gunning.—You know who *he* is?'

The girl gave him two or three quick nods.

'They must have gone, I think'—but Fenwick's manner was doubtful—'to look for you.'

'How can that be?'

Fenwick reflected for a moment; then he said: 'He will not rest until he has found his model.'

'You cannot mean me?' said she, with a quick shy glance at Millward's picture.

'Yes; I mean you. You *are* his model; are you not?'

'I am nobody's model. I was never inside a studio'—

'Not even in the spirit?' Fenwick laughingly interposed.

Her look wandered round the room. 'I've been *here* in the spirit—if you choose to call it so—hundreds of times.'

'Lately?'

'Yes; quite lately.'

'Then you must have seen me?'

She gave him a smile. 'Yes; you are Mr Fenwick.'

He looked at her in blank surprise.

'I've seen you on the terrace,' the girl went on, 'smoking cigarettes.'

'With Millward?'

'Yes; and often trying,' said she, 'to make him laugh. He never laughs,' she added; 'does he?'

'I think not.—But tell me,' said Fenwick with growing interest, 'what are you called?'

'Niobe.'

'Ah! who gave you that pretty name?'

'I don't know.'

'Your fairy godmother, perhaps?' Fenwick suggested.

'I don't know. It was given me, you see, before grandfather found me on the river-bank.'

'A naiad? You were born, then, among the lilies?'

Niobe looked up and laughed. 'Ask grandfather. I can't remember.'

'Grandfather? Who's he?'

'Don't you know? Why, old Gunning, as you call him.'

'Old Gunning?' cried Fenwick. 'Then you are my friend's model, after all?'

'No,' she persisted.

'Then who and what are you?'

Niobe sat down, and leaning forward with her small hands expressively clasped, she answered: 'When out in the boat—grandfather and I—we have many a time passed this house; and many a time I have asked him to tell me something about it. For it has always seemed to me—ever since I can remember—such a queer-looking place. He told me at last that it was Mr Millward's house—that this room, with the only clean windows, was the studio; and that you'—

'What of me?'

'That the gentleman who smoked cigarettes, and never did any work,' said she, with shy twinkling eyes, 'was Mr Millward's pupil.'

Fenwick laughed. Then suddenly growing serious, he said: 'What else do you know of Millward?'

'Nothing.'

'You have never spoken to him?'

'No; he has never seen me in his life.'

'Never seen you?'

'Never, that I know of,' said the girl. 'Indeed, grandfather always kept in mid-stream, afraid that he or you might speak to me when we passed by on the river.'

Fenwick expressed surprise. 'Why shouldn't we speak?'

'I will tell you.' She paused for a moment with a thoughtful look.—'When I mentioned being here in the spirit,' the girl then explained, 'I meant that I had frequently pictured this studio to myself. I longed to come here and see what it was like.—At last,' she added, 'I made up my mind.'

'Well?' said Fenwick, lighting a fresh cigarette.

'I made up my mind that unless grandfather brought me, and very soon too, I should come alone. He was always putting me off,' she said with an impatient stamp of her pretty foot—'always ready with some excuse. He owned to me at last that Mr Millward had refused to admit any one into the studio except a few intimate friends. If he hinted at bringing me here to look at the pictures, Mr Millward might be seriously offended. And grandfather cannot afford,' she added, 'to run the risk of giving offence to so good a customer.'

'So you resolved to come alone?'

'Yes.—Do you think Mr Millward will be very angry?'

Her naïve question amused him. He looked with increasing concern at the girl. 'What pleasure could you possibly find,' said he, 'in paying this visit to a dusty old studio?'

'I would go any distance,' she answered with a brightening look, 'to see a picture! I've been crazed on the subject of pictures ever since I was quite little.' Then turning with a still more earnest look towards Millward's picture, she asked: 'Is it difficult to paint?'

'No. The great difficulty is to be a master,' said Fenwick. 'In order to be that,' he added, answering her inquiring glance, 'you must be a true lover of nature: you must understand light and shade—have colour, drapery, and metaphor at your fingers' ends. A poetic imagination is likewise indispensable, and a dozen other qualifications.'

'Is smoking cigarettes one of them?' said she with a sly look.

Fenwick blew a cloud of tobacco into the face of a Cupid that stood on a pedestal at his side, by way of answer.

There was a moment's pause.

'You are not a master,' the girl then timidly inquired—'are you?'

'No.'

'Why not?'

'I have no model,' said he. 'I need some one like yourself to inspire me.'

Niobe made no reply. She regarded Mill-

ward's picture for a while in silence; then she said: 'Your friend can paint without a model. Why can't you do the same?'

'I should fail, as he has done.'

'Do you call this a failure?' said she, still looking at the master's work.

'No. But Millward will call it so, when he comes to see you.'

The girl laughed shyly, and said: 'You are given to flattery.'

'No, indeed! I was never more in earnest,' was the answer. 'Millward must have caught a glimpse of you somewhere—it must have been you! And by some magic power of the imagination, which I confess is beyond me, he has reproduced you in his pictures; just as though you had each time wandered into the studio, as you have done to-night, and sat for him as you were seated when I startled you out of the arm-chair a moment ago.'

Still looking at the picture with a thoughtful face, the girl remarked: 'It does seem strange.'

'More than strange.—And just fancy,' Fenwick went on, 'how troubled his thoughts must be! He is conscious of his ability to produce a great picture—the shadow of it haunts him night and day—but he needs another glimpse of the model in order to give that one touch which means perfection.'

In the moment of silence that now followed, for the girl stood pondering Fenwick's words, the sound of oars reached their ears. She now looked up quickly into the artist's face. 'They are coming back,' she whispered.

'Yes,' said Fenwick with laughter in his eyes, 'so you cannot go to your boat. You would be caught.'

'But there is the front door,' said the girl, moving from the window. 'Won't you let me out?'

'No,' said Fenwick playfully. 'You have come to pay Millward a visit. You cannot object to see him now.'

'To-night? Pray, don't detain me,' said she distressfully; 'grandfather would be vexed beyond measure.'

'Have no fear,' replied Fenwick reassuringly, as he gave her a hand-lamp and opened the studio door. 'Take this light and amuse yourself about the house. You will find pictures in nearly every room, on the staircase, and along the corridor overhead. Leave me to put matters right with grandfather.—Come; won't you trust me?'

She looked up smilingly into his face, took the lamp from him, and went out.

Fenwick now began to pace the studio in an ecstasy of delight. He had found the model for whom he had fruitlessly sought ever since he had been Millward's pupil. He had met her to-night: he had met the woman whose first look had kindled the love that he knew would come the moment that the ideal in Millward's pictures crossed his path. He had not only seen her; he had spoken with her; he had learned that her uncultured love of art had brought her to the studio. And she had seen him, many a time, as she had confessed; and in her glances he had read to-night, as he imagined, her secret thoughts of him. He loved

her. She would one day be his model—one day, perhaps, be his wife! He would realise his dream: he would reach fame after all.

'If an artist would become a great master he must worship his model,' was one of Millward's sayings.

Then the thought came to him she was not Millward's. He had no right to love her, perhaps—no right even to think of her while this mystery of her strange resemblance to the master's model remained unsolved.

He glanced round the studio. Had this interview been nothing but a dream? Now that the girl was no longer here, his brain was perplexed once more with the thought of Millward's wandering spirit. Had it been here to-night—had it begun to haunt him as it had haunted Millward for so many years?

ST ELMO'S FIRE.

ONCE, in mid-ocean, when the air was charged with electricity, it was our good fortune to be an observer of this beautiful form of Nature's electrical display, from which no damage ever directly results. A weird flickering flame, or luminous brush, was distinctly visible at the topmost extremity of each of our good ship's tapering top-gallant-masts, in consonance with the description of this natural phenomenon which Falconer has left us in his grand old nautical poem entitled *The Shipwreck*:

High on the masts, with pale and livid rays,
Amid the gloom, portentous meteors blaze.

Some say that such startling displays are not uncommon at sea during thunder-storms; but we are of opinion that mariners may be years afloat without witnessing one; so that when seen it is as well to make a note thereof, in accordance with Captain Cuttle's advice. Terrestrial objects when seen,

Bespangled with those iles of light,
So wildly, spiritually bright,

have never failed to arouse the superstitious awe of mankind in remote ages; but the cause of this lambent luminosity remained unexplainable until modern philosophers demonstrated that it was merely an example, on a more extended scale, of the brush discharge of an electrical machine.

It is said that flames played about the heads of Castor and Pollux during a violent storm which arose when the Argonauts set sail; and inasmuch as a calm followed this remarkable apparition, the two heroes were looked upon as succouring divinities. Whenever these flames glowed upon a ship's spars at a later date, it was believed by the old-time navigators that Castor and Pollux had come to aid the toilers of the sea. They deemed it a forecast for favourable weather and a quick passage if two flames were visible at the same instant; but the omen was unpropitious if only one flame made its appearance; and the simple sailors viewing this solitary sign with displeasure, called it after Helen, that fair one whose frailty proved so

disastrous to the welfare of Troy. These natural electric lights are now spoken of indiscriminately as St Elmo's Fires, or Corposants.

St Elmo's Fire is not peculiar to ships at sea, although Camoens in his *Lusiad* has termed it 'the living light sacred to the mariner;' for it has often been observed upon church steeples, branches of trees, and even on the projecting parts of men and beasts. Cæsar has written that one night a dense cloud suddenly formed, followed by hail, and on the same night the points of the spears of the fifth legion commenced to glow spontaneously—'Eadem nocte legionis quintæ cacumina suâ sponte arserunt.' Shakespeare, in *Julius Cæsar*, causes Casca to address Cicero in the following words:

A common slave—you know him well by sight—
Held up his left hand, which did flame, and burn
Like twenty torches joined; and yet his hand,
Not sensible of fire, remained unscorched.

Seneca affirmed that a star settled on the lance of Gylipus while sailing towards Syracuse; Livy said that the spears of some soldiers in Sicily seemed to be on fire; and Pliny is even more explicit. He had seen stars rest upon the points of spears borne by soldiers keeping night-watch upon the ramparts. 'Corposants' had also been seen at sea upon the extremities of the yards and masts of a ship. They changed positions and emitted a rustling sound 'like the fluttering wings of birds.'

Coming down to more recent times, we find in the Philosophical Transactions for 1745 that a Roman Catholic priest marvelled that on several occasions, while travelling on the highest mountain peaks of Chili and Peru, both men and beasts shone with a bright light from head to foot. Lichtenberg in 1768 observed a vivid display of St Elmo's Fire upon the steeple summit of St Jacques at Göttingen; and ten years later many sacred edifices of Rouen were similarly illuminated during a violent storm. In 1822 the extremities of the branches of trees at Frey Viry glowed with a faint flame of a blue tinge. In 1825 some mountaineers became involved in threatening thunder-clouds at an altitude of eight thousand two hundred and fifteen feet. Their hair and the string of their caps stood on end like 'the quills of the fretful porcupine,' and a buzzing noise was heard around them.

The Rev. Mr Pindar, Principal of Codrington College at Barbadoes, in 1831 saw two negroes making the best of their way across the college garden during the height of an awful cyclone that devastated the sugar plantations of the island. Electric flashes were passing from the bodies of the negroes, whereat they evinced extreme terror. In that year, also, several officers of the French army, stationed at Algiers, were walking with uncovered heads in the open air on the terrace of the fort during a storm. Each saw the other's hair assume a perpendicular position, and every hair appeared to be tipped with a tiny luminous

tuft. The finger-tips also glowed when their hands were elevated.

Travellers have not infrequently evinced great concern at seeing their garments lit up by St Elmo's Fire. A French physician, surprised by a sudden storm of wind and rain, discovered that the stiff rim of his hat emitted a lurid light. Unthinking, but in haste, he jumped to the conclusion that his head-covering was on fire, and raised his hand for the purpose of quenching the flame. Straightway this member became luminous, and the doctor knew that his startling visitation was St Elmo's Fire. A cartload of straw has seemed to be the abiding-place of myriads of glow-worms, and the driver's whip was well illuminated with electric streamers. Like the bush seen by Moses, it appeared to the astonished rustics to burn with fire, but to remain unconsumed.

The electricity of the atmosphere varies with time and place. The late Professor Loomis, the well-known American meteorologist, read a most amusing paper in 1857 before the Mathematical and Physical Section of the British Association. It dealt with the electrical phenomena of the United States, and more especially treated on the curious experience which dwellers in New York houses have in the winter-time, when the rooms are heated by stoves to such a degree that the woodwork becomes dangerously dry and all the furniture shrinks and creaks. Electricity is so powerfully present that it is only necessary to shuffle across a floor which is covered with a woollen carpet of moderate thickness in order to convert the shuffler's body into an electrophorus or electrical machine, so that he may not touch a piece of metal without suffering a sharp shock of electricity.

La Nature has recently related the experience of a traveller journeying with a caravan in the vicinity of Teheran. The atmosphere was so highly electric that neither steel nor match was required to discover a pin or a piece of money dropped upon the ground, inasmuch as the metallic bodies became self-luminous. The glimmer which accompanied the dislocation of the fibres of a sheet of paper torn across slowly was sufficiently intense to cast a lively brightness around the spectators. While on the march one moonless night, sheaves of sparks flew from the tails of the long-suffering mules every time that they lashed their flanks with their caudal appendages. A curious crackling noise was also audible.

Columbus, in October 1493, during his second voyage in quest of a new world, was under the influence of a storm of wind, rain, and thunder, when, following the quaint diction of his translator, St Elmo appeared on the topgallant-mast with seven lighted tapers. Good churchman that he was, his thoughts naturally reverted to the shrine at home. His mariners were convinced that this unwonted display proceeded directly from the saint's body, and they forthwith commenced to sing litanies and offer up thanksgivings, because these rude seamen held that the worst part of the storm had passed over their labouring caravel as soon as St Elmo appeared. Magellan's sailors were possessed with a similar superstition. Dampier has left a well-drawn word-picture of St Elmo's Fire that he observed during a storm near

Canton River in 1687. 'About 4 a-clock the thunder and the rain abated, and then we saw a "corpus sant" at our maintopmast head, on the very top of the truck of the spindle. This sight rejoiced our men exceedingly, for the height of the storm is commonly over when the "corpus sant" is seen aloft; but when they are seen lying on the deck it is generally accounted a bad sign.' Such a belief is without foundation; and, moreover, their fond anticipations were not realised, for the gale subsequently blew harder than before the appearance of St Elmo's Fire.

In 1696 a ship sailing by the Balearic Isles was caught in a heavy thunder-storm, when more than thirty corposants were seen in full play at one time. An especially shining specimen, situated on the mainmast vane, was more than eighteen inches in length. This would seem to be within the limits of probability, for Mr Buchan, in his *Handy Book of Meteorology*, quotes an instance of a display at Orkney in 1837 when a flame one foot in length was seen streaming from an iron spike at the top of a mast. The ancient mariner referred to above was of a curious turn of mind. He sent a man aloft, who brought down the iron wind-vane; but the flame now shone at the masthead without any diminution in intensity, until it eventually died down when the electricity had ceased its influence. In January 1749 the newly-built wooden ship *Dover*, trading between Liverpool and New York, had three very brilliant corposants at her mastheads, which looked like very large torches.

The ship *Southern Cross*, Captain Howe, was in fifty-eight degrees south, seventy degrees west, one night in the month of September, when the celestial concave was starless and intensely black. The crew were awe-struck witnesses of such a strange sight as seldom falls to the lot of man. The gallant ship was plunging heavily, burying her bows beneath the boisterous waves, caused by a savage storm which battled against her with all its fearful fury. Suddenly the Aurora Australis, or 'Southern Lights,' became visible. Ship, sea, and sky were illumined by a deep crimson glow, as though an awful conflagration was not far distant. The mysterious luminous balls of electric origin rested high aloft on the extremities of her spars. It was a panorama surpassing in its terrible grandeur anything that the most vivid imagination could depict.

In August 1881 the large iron ship *Oimara*, Captain Roy, when in fifty-eight degrees south, sixty-two degrees west, had a heavy gale, accompanied with snow-squalls. About two o'clock in the morning she was most brilliantly illumined by corposants. St Elmo's Fires burned brightly at each masthead, looking for all the world like an artificial electric light of many candle-power, but softer and of a bluish tinge. All her yard-arms on the side nearer the wind, from the lower topsail upwards, along the lifts and footropes, up and down the topmast and topgallant rigging, together with the windward side of her massive masts, were closely covered with small star-like lights. Larger lights lingered on the ends of her gaffs; and the chains supporting the gaffs were literally lined with lesser lights. One of her seamen, in default of a more appropriate simile, asserted that the *Oimara* was as well illumined as any music hall in London.

This remarkable display lasted for about the space of twenty minutes, and was the precursor of very bad weather.

About twelve months ago the large iron ship *Candahar* of Liverpool, under the command of Captain W. P. Hughes, experienced squally weather accompanied with rain and lightning in thirteen degrees north, ninety degrees east. She had St Elmo's Fires on all three of her mastheads, and they were distinctly heard to emit a loud tick similar to that of a large galvanic battery. We presume that the sound was likened to that given out by one of those electric machines which are often to be found at the street corners of our large cities.

The Cunard steamship *Cephalonia*, Captain H. Walker, when off Cape Cod, on the Atlantic seaboard of the United States, had a terrific thunder-storm in the early morning of October 7, 1888. Lightning ran down her rigging and about the deck like molten silver. St Elmo's Fires at her mastheads and yard-arms were preternaturally brilliant.

We have known some shipmasters refer to St Elmo's Fire as *ignis fatuus*, than which no two manifestations can have a more totally distinct origin. The former is an electric display; whereas the latter is due to the combustion of a gas, a compound of carbon and hydrogen, derived from the decay of vegetable matter.

THE CREEPING PLANT.

A STORY.

POOR Hammond managed to get a month's leave at the same time as myself. That was how we came to join hands and arrange for the trip to Formosa. I wish I had worked on for a year longer now, with all my heart.

We crossed from Amoy to Taiwan, a big town on the west coast of Formosa, and made our preparations for getting well into the wilds. You see, we had both been in China a matter of ten years, and could pass muster very well with our knowledge of two or three dialects of the dreadfully profuse language of the Empire. And so we expected to get along all right—I to shoot a variety of strange quadrupeds and feathered creatures, and Hammond to enlarge his already very copious collection of plants and grasses.

I never knew a man more enthusiastic about his hobby than was Hammond about his specimens. It cost him many a groan to leave them on the mainland. But for the infinite annoyance they would have cost us both, he would have carried them with him to Formosa. They filled eight boxes as big as American travelling trunks—what with their layers of wool and thick blotting-paper, and the camphor-wood cases in which the different species reposed apart from each other. Poor old chap! he might have pleased himself in the matter. I wish he had, for his interest in the things might have kept him from the craze that killed him.

For a week we had a very agreeable time in the bungalow of a certain Scotch missionary whose

name will be a familiar memory to every European who has stayed awhile in the island. He was—indeed is—a very remarkable man, and a credit to the Anglo-Saxon race. If every man had his due, he ought to be acknowledged as Governor-general of Formosa; though I doubt he would refuse the dignity. This by the way. And yet I ought to mention him if only for the earnest warning he gave us about the vermin and reptiles of the interior. We spent two days in journeying from his house to the woods in which we proposed to camp for a fortnight, as happy as Adam and Eve before the Fall.

The forest scenery was magnificent, but the brake of brambles and flowering creepers which matted themselves between the tree trunks made progress very slow. We did not stick to the tracks: otherwise, of course, it would have been different. And we were repaid for our labour by the strange creatures I shot, and by many a grass and flower which Hammond was as elated over as a mother with her first child.

Two more days passed, and we pronounced our holiday a success. Then Hammond sickened of a fever or a sun-stroke, I could not determine which. He became delirious, and I feared he would die. I must say the native Formosans, for all their savage look—they were all but naked in this part of the island—were very kind. They brought me various juices and simples, which they urged me to use upon the invalid. But I was afraid to do that. I preferred to rely upon cold sponging and the quinine in our medicine chest.

On the seventh night of his illness, when he was so quiet and improved in tone that I thought I could leave him in charge of Wan Tan, our little native aide-de-camp, and get a good sleep myself, I was suddenly awoke by the boy with the words, 'He has gone!' True enough, Hammond had evaded his guard and run off into the woods in his 'pyjamas.' I was dreadfully alarmed. Without loss of time, however, the boy and I set out in pursuit; and after about half an hour we caught him up as he was returning with bent head and puckered brow, but looking as free from delirium as man could.

'Why, my dear fellow,' I said, 'what in the world led you to do so mad a thing?'

Hammond gazed at me indifferently for a moment. It was just as if he had not yet got his senses fully after a bad night. Then, with a good deal of excitement, he bade me congratulate him.

'Upon what?' I asked.

'Do you not remember,' he replied, 'how we two have talked about the possible existence of plants that move from one spot to another with the same freedom as we conceited bipeds? Well, I've solved that problem. They do exist. But I can't—I really can't—make out satisfactorily whether they do it by the exercise of volition, or whether they are transported in spite of themselves. It's not a bit of use troubling the British Association on the subject until we have settled that—is it?'

I was half disposed to laugh at him when he said this. But the mysterious and quite unusual kind of earnestness in his expression while he was speaking not only deterred me, but even again made me feel uneasy about him.

'You are not serious, Hammond?' I said. 'And besides, old fellow, it's very wrong of you to run away in this fashion. Not to speak of the fright you gave me, you'll catch a chill, and we shall have that fever business all over again.'

'Fever business! What do you mean?'

'Why, you know you have been ill, and you're not well yet; and so come right along to bed again.'

He said nothing to this, but allowed the boy and me to take care of him. I must say he looked a strange object wrapped up in the blue blanket which I had seized for the purpose when we went after him, and especially when the moon shone upon him through the teak-trees of the forest. The scurrying among the branches overhead seemed to imply that the monkeys also found him a spectacle too strong for their nerves.

He was better in the afternoon, and talked of the service and other matters in a perfectly rational manner. It seems he had written to Pekin, begging to be removed from Amoy; and he discussed the chances of a favourable reply to his letter rationally enough, though with a disregard for the bereavement that I in that case should suffer which puzzled me. For he was naturally the most unselfish of men; and he had over and over again said he would never leave Amoy without me, and that he would never be left in it if I was appointed Vice-consul elsewhere.

Towards sunset he became excited. I did not like the metallic glitter in his eye. It recalled to me in an ugly manner a certain visit I had paid to a Chinese madhouse a little time previously. He was irritable, moreover, and would not let me touch his pulse. When I wanted him to come into the hut for the night, he objected.

'No, Randolph,' he said, 'not till the moon there also goes to bed in the antipodes. I particularly mean to be awake to-night.'

'Why?' I asked.

'Because I am as sure as I stand here that I saw one last night, and it was when the moon was high. I reckon it went at about the rate of a yard a minute. I mean to secure it; and I should very much like to photograph it before nabbing it.'

'What are you talking about, old chap?' I asked again, with the dismal fear at my heart that the fever or sun-stroke had affected his brain.

'The creeping plant, Randolph. It was, as well as I could guess at it, nine feet long, with flowers all the way along it—the calyx a bright blue. I never saw anything so odd since I was born. Do you know, I almost lost my senses in a sort of excitement over it; and I suppose it got away in the meantime, for when I tried to find it again, I couldn't!'

I could only stare at him in bewilderment. He was certainly not joking; and yet the idea of a plant of this description was to my unobservant intelligence perfectly ridiculous.

But poor Hammond did not like my incredulous look. 'You don't believe me, I see!' he exclaimed pettishly. 'That's ever the way with you practical fellows. I am thankful I'm not practical. Anyhow, too, I mean to get it this night, alive or dead—that's a clear thing.'

'No, no; please, don't think of it,' I entreated. 'Wait till you're a bit stronger, and then if you

like, we'll do nothing else but hunt this crawling beanstalk, or whatever it is.'

'I am as strong as ever I was, if I may judge by my feelings, and so you may as well make up your mind to my going. Remember, Randolph, that I'm your senior in the service, and I won't put up with dictation from you or any other man of your time of life.'

I could only shrug my shoulders, and suggest to him as casually as possible that of course I had no right to interfere with his movements, but that for his own sake he ought not to go off in 'pyjamas' again, as he did before.

'Yes, that was indiscreet,' the dear old fellow observed with a smile.

We humoured him for the rest of the evening, and at length he fell asleep in his bamboo couch-chair, and we covered him lightly and arranged the mosquito curtains to protect him as much as possible.

But I had no intention of going to bed. Somehow or other, I fancied he would wake and start off into the woods, just as he had done before. At the back of my mind I confess, too, there was a thin phantom of curiosity about the shape nine feet long, with flowers upon it, which had fitted so well with Hammond's ideal of a creeping plant.

Accordingly, I lit my pipe and read the *North China Herald* until I began to feel drowsy. The paper had dropped from my hands, and I was pondering weakly about the likelihood of some good-natured senior in the service resolving to retire or to die for the good of his juniors, when I heard a rustling. My eyes opened sharply. Yes; it was as, with electrical promptitude, I had surmised: Hammond was bolt upright, staring at the moonshine outside, and pushing the curtains away from him. I did not move, but watched him between my half-closed eyelids.

Consciousness seemed to come upon him all in a moment. He bounded from the chair and made for the door. Then, with a look I shall never forget, he turned back and snatched up the same blue blanket I had wrapped him in before. He flung it over his shoulders and sped into the open. I followed him. And I had to be brisk, or else I should soon have lost sight of him; for the dark limbs of the trees were thick enough to hide him for a quarter of a minute at a time. It was a strange chase, this in the murmurous night, with ever and anon the startled cry from a parrot or a monkey resounding in the air. A barred tailed pheasant shot over my head with a whirl that would have made a man unused to such noises wonder what was happening. Bats, too, went to and fro in the moonlight, now and then eclipsing the planet completely.

I don't know how long I followed the poor fellow; I know only that I was much torn by the thorns on the rose-bushes which impeded my movements. How sweet was the perfume of these blossoms in the cool, humid night-air, I can recall at this moment distinctly.

It was almost by accident that I at length came upon Hammond. He was stooping and peering here and there about a small spot of common grass with holes in the ground and a thicket of bramble and clematis at one side. I did not notice it at first; but there was a woof

of passion-flowers hanging from one of the boughs of a tree just over him. One of the flowers was a superb specimen with a dazzling corolla.

Standing in the shade, I watched him. He began to poke among the brambles with a bit of stick. Then there was a movement, and with an exclamation of 'Did I not say so!' Hammond stepped tenderly aside while—a great snake crept forth with an angry hiss and a poise of its head. I had time to see that its body from the shoulder was beautifully marked much as Hammond had described his plant; but time for no more. The poor fellow had bent down and made a snatch at the reptile; at the same instant the snake had darted at him and bitten him over the eye. And when I had rushed to the place, the snake had gone, and Hammond was holding both hands to his face and looking about him with an awfully dazed expression. The shock had brought him wholly to his right mind!

On our way back, he commented on his folly as if it had been the action of some one else. But the pain of the venom in him had already begun to tell. Between us we had done what we could as precautionary measures, though this was little enough.

He was prepared for what followed—so much prepared that he made me write his will for him the moment we re-entered the hut. I did it on a piece of common tissue-paper, the only available material. The swelling all the time was getting worse and worse; nor was his agony in the least abated by the fat and oil which Wan Tan rubbed upon it.

The poor fellow died at eleven o'clock, after suffering fearfully. Almost his last words were these, with an attempt at a smile that nearly set me crying: 'What an ass I was, to be sure, old fellow!'

Before I left the place, and when we had buried him, I made my way again to the spot where he had met his doom, and pulled down the spray of passion-flower which had drooped over him when he was bitten. This flower, dried, and under glass, is one of various articles that serve as mementoes of incidents in my career—incidents, I am glad to say, not always so tragical as this.

THE WESTMORLAND STATESMEN.

WESTMORLAND, though one of the smallest, is one of the most interesting counties in England. It is celebrated not only for its mountains and lakes, which attract tens of thousands of visitors every season from the Continent and America, as well as from Southern England and Scotland, but also for its antiquarian relics, such as Arthur's Round Table, and the Druidical Circle at Maybrough; its grand feudal fortresses of Brougham Castle, Brough, Pendragon, and Egremont, the strongholds of the great old families who ruled the north with almost regal authority; its picturesque Halls; the scenes immortalised by the finest poems of Wordsworth; and, not least, its Statesmen, or hereditary proprietors of land which they farm themselves.

The yeomen of Westmorland and the adjoining county of Cumberland receive the designation of Statesmen to distinguish them from the ten-

antry who rent the land which they cultivate. They occupy a position in society immediately below that of the Squires. Their estates vary in size at from eighty to two hundred and fifty acres, and they have also extensive common rights, which add largely to the value of their property. In the olden times—indeed, down to the union of the kingdoms, the defence of the Borders against the Scottish moss-troopers, who, as Camden says, 'had no measure of law but the length of their swords,' mainly depended upon the Statesmen. For this purpose, they had to be armed, horsed, and ready to fight. In the rental attached to a decree in the Court of Chancery, it is stated that the Statesmen had time out of mind 'held their several tenements by serving upon the borders of England, over against Scotland, at their own proper costs and charges, within the said West Marches.' In order that they might be ready to perform this service, each of them was required to keep 'such a nagge as is able at anye tyme to beare a manne twentie miles within Scotland and backe againe without a baite.' They were to be provided with 'a jacke, steale-cap, sword, bowe, or speare;' and were to be ready 'to serve the Lord Warden or their officers upon sixe houres warning, in any place where they shall be appointed to serve.' They were also required to appoint a watch over their farms by day and by night.

The Scottish freebooters, however, were not the only assailants against whom the Statesmen had to defend their property. Shortly after the union of the Crowns, King James, with his characteristic unscrupulousness and greed, set up a claim to the lands of the Statesmen on the plea that they were merely the tenants of the Crown. They met, however, to the number of two thousand at Ratten Heath, between Kendal and Stavelay, where they formally resolved that 'they had won their lands by the sword, and were able to hold them by the same.' The monarch, on hearing of this meeting, made no further claim to the lands of the Statesmen.

As might have been expected from the condition of the country while England and Scotland were separate kingdoms, the houses of the Statesmen were constructed for defence as well as for residence. They were protected by strong doors and gates, and had small windows crossed with bars of iron. Adam Pringle, in his 'General View of the Agriculture of the County of Westmorland,' published in 1794, says: 'The principal structure is a barn, which, while it has a stable and cowhouse on the ground-floor, is frequently large enough to contain the whole produce of the farm.' These securities against assailants have of course been long dispensed with, and the subsequent dwelling-houses of the Statesmen usually consisted of four rooms on the ground-floor, and two on the second story. The front door was covered with a low porch, from which a passage, nearly four feet broad, led to the back door on the other side of the building. Beside it stood

the 'doun-house,' which was open to the rafters. Here the baking, brewing, washing, and other domestic work were performed. The dwelling-house, properly so called, was lighted by two small windows in front and one behind, and was the common apartment of the family at meals and in the evenings. On the ground-floor there was also a pantry, and a chamber called the Parlour, in which the master and mistress slept. The children and servants slept in the loft, which was unceiled. The fire was lighted on a hearth slightly raised from the ground, as was the custom in Scottish farmhouses of the same class. The buildings, which were of stone, were covered with thatch of heath or straw, and, in the western mountains, with a sort of heavy blue slate. With the exception of a few modern conveniences, no change has taken place in the houses of the Statesmen for at least a century.

The furniture was solid and substantial. The chairs were of heavy oak, with high arms, and carved on the back, but narrow, upright, and uncomfortable. Three-footed stools were, however, the most common movable seats. The bedsteads, too, were of oak, with carved testers of the same wood. There were large presses or 'aunries,' in which the food was kept; and strong clumsy chests, the fronts of which were ornamented with carved borders, for the custody of the family clothing. The general sitting-room of the family, which was known as 'The House,' contained a long oaken table, with a bench on each side of it, where the whole family, master, children, and servants partook of their common meal, as was customary in Scotland a century ago. 'Come in,' said a tenant to his landlord one day. The landlord went in amongst the family, the servants, and the labourers, who were about to 'set to.' Near the end of the table was a large hot-pot containing beef or mutton cut into pieces, and put into a large dish, along with potatoes, onions, pepper, and salt. The farmer, after helping himself, thrust the dish towards the landlord and said: 'Noo ye man help yersel, and *hock in!* There's plenty meat at bottom, but it's rayther het!' The Statesman's household subsisted entirely on the produce of his farm. Porridge and milk, oat cakes, cheese, and potato-pot, formed the staple of their food, varied in winter by salt beef, or mutton and bacon. Wheaten bread was used only on special occasions. Each family brewed its own ale from a species of barley called 'bigg.' 'The clothing of the men,' says an old county historian, 'was of the native fleece of the county, homespun, and woven by the village weaver; the wool of a black sheep, slightly mixed with blue and red, was the favourite colour of this cloth, which was thick and heavy, and of which the coat and waistcoat were made; the breeches, if not of the same, were of leather, generally of buckskin. The women's apparel was of the finer sort of the native wool, woven into a kind of serge, dyed of a russet, blue, or other colour, and, like the man's, made up by the tailor at the wearer's own fireside. Clogs or wooden-soled shoes still continue in common use, and are well adapted to a mountainous and rainy country.' The linen worn by the family—shirts, shifts, sheets, and towels—was made of the flax grown on almost every farm in the county. The close resemblance of this

state of domestic affairs to that which existed among the farmers and minor gentry of Scotland a century ago is very striking and instructive.

The intrusion of manufactured goods into these districts has produced a certain amount of change in the apparel and living of the Statesmen, but much less than might have been anticipated. This change is most apparent in the lower and more cultivated districts, where the inhabitants come more immediately into contact with the outer world. At the same time, they are regarded as of a sturdier character, with more mother-wit and backbone than their more secluded brethren. The Statesmen of the mountain districts are still a very primitive class of people. Their chief occupation is tending their large flocks of sheep, which are never taken into the farmyard. Their land is seldom entailed, but it is a point of family honour that it should descend from father to son. Hence, not a few estates have been held by the same families for four centuries, and in several instances, men are now in possession of the very farms which their ancestors cultivated eight hundred years ago. It has been said of them by one who knows them well that 'they know nothing of the rate of discount, or the price of gold. They have enough of this world's gear to serve their purpose. They are uncorrupted by modern luxury. They are content and happy to enjoy the golden mean of Agur. They pass a simple and inoffensive life amongst the lonely hills that surround them. Their hospitality to strangers is open-handed and liberal. "Go," said one of these Statesmen to a tourist whom he had entertained for several days—"go to the vale on the other side of yon mountain; you will find a house belonging to a Statesman; enter it, and say you came from me. I know him not; but he will receive you kindly, for our sheep mingle upon the mountains."

These men have no inclination to change, either in their life and customs, or in their sheep-farming. An old farmer who was asked why he did not take any steps to improve the very bad breed of sheep on his estate, answered: 'They were such as Providence had put on the land, and it was not for the likes of him to change them.' With regard to the Statesmen of both districts, it can be said with truth, that they are not only satisfied with their social position, but proud of it; and though not rich in money or land, they are rich in character and healthful contentment. They are still as they have always been, a sturdy, outspoken, independent race. The late Sir James Graham, the well-known statesman, justly said of the cavalcade of mounted Statesmen who accompanied Mr Blamire into Carlisle on his appointment as High Sheriff, that they were 'a body of men who could not be matched in any other part of the kingdom—that they were the finest and purest specimens of a set of men who in all periods of its history had been the strength and pride of their country.' It is a singular fact, mentioned by Brayley, that the courtesy titles in use among Statesmen differ widely from those employed in ordinary society. The mistress of the house is termed a Dame; the eldest son of a Statesman is the Laird, or Lord, or, where there is no son, the eldest daughter enjoys the title of Lady.

Thus, while the Statesman himself was at the plough, the Laird was driving the cattle to market, or attending it with vegetables, and the Lady was working at the churn.

In respect to education, however, a change has taken place for the better among the Statesmen. In the olden time, there were three excellent grammar-schools in Westmorland, which sent to Oxford and Cambridge a number of learned divines, conspicuous among whom was the great Biblical scholar, John Mill; but with these seminaries the Statesmen had, of course, nothing to do. The local schools in which the children of the agricultural population were educated were of the most unsatisfactory kind. Any man who was physically disabled from earning his bread by manual labour, or too indolent to do so, was thought quite fit to be a teacher. Not a few of them were intemperate in their habits. A clergyman who had experienced the lifeless teaching in one of these schools at Bolton-Gate, enforced by caning and whipping, says: 'Dull tradition and immobility are very conservative in isolated country-places like Bolton. The curriculum consisted of the three *R's*, with spelling. I have no recollection of learning anything like grammar or parsing. One other thing, however, was carefully taught—the Church Catechism. In Lent, every year, we spent much time in committing it to memory, and on the afternoon of Easter Sunday we were publicly examined in it by the clergyman in the church, in presence of the largest congregation that assembled on any day of the year; for the parents were there, wishing to hear their children acquit themselves well.'

Now, however, thoroughly educated and well-trained teachers are to be found among the hills as well as in the dales of Westmorland; and the influence which they are exercising on the manners and customs of the rising generation, as well as in giving efficient instruction in the elementary branches of education, is highly satisfactory. In no county in England is so small a number proportionately unable to write. The gratifying result is that while the eldest son becomes a Statesman like his father before him, the younger members of the family are fitted for the duties of business life, and not unfrequently rise to eminence as clergymen or merchants and manufacturers. Professor Sedgwick, the eminent geologist, was the son of a Statesman, and prided himself on that distinction more than on being a Cambridge Don; and so was George Moore, the successful merchant and celebrated philanthropist.

At the beginning of the present century, about two-thirds of the land in the shire was held by what is called 'customary tenure' in properties which at that time were worth from fifteen to thirty pounds of yearly rent, and had been in the possession of the same families for centuries. During the course of the last fifty years the number of these small proprietors has considerably diminished, but the value of their farms has greatly increased. Much regret has been justly expressed that these small holdings have been passing out of the old families, and been absorbed in large estates more rapidly than formerly. As Dr Lonsdale has said: 'Many "a canny house" whose yeomen had for centuries

kept their rule, taught their sons and grandsons the traditions of their home, no longer shelters the "weel-kent folk of other days." But in not a few instances the sons of Statesmen, who have been successful in business, have returned to spend their closing years in their native dales, so that the number of small properties in the county has not been materially diminished.

A KNOT OR NAUTICAL MILE.

How much is a Knot? This question is asked, we believe, in every sea-passage by some passenger or other, and never meets with a clear reply. Sailors themselves do not describe it distinctly, and books of reference differ as to its dimensions. We purpose to answer the question here.

A knot is one-sixtieth of a mean degree of the earth's meridian. This definition requires explanation, and also numerical computation. The earth's meridian is commonly described as any circle whose centre is the centre of the earth, and whose circumference passes through the Poles. This is not exact, because the meridian is not a true circle. Evidently, it would be a true circle if the earth were a true sphere; but the earth is not a true sphere—it is a spheroid, its diameter measured on the axis being less than its diameter at the equator. Hence the circumference of a section of the earth by a plane passing through its centre and the Poles, which circumference is a meridian, is not a true circle, but an oval. Bearing this in mind, it will be easy to understand the meaning of a *mean* degree of the earth's meridian.

If three hundred and sixty separate degrees be set-off from the centre of a perfect circle, it is evident that the circular measure of each degree measured on the circumference of the circle will be the same. But if they be set-off from the centre of an oval, the measurements on the circumference of the oval will not all be the same. That this is the case any one may demonstrate for himself by drawing an oval and its minor axis, and then, from the centre of the oval, with radius equal to its semi-minor axis, inscribing a circle in the oval. If, now, degrees, or rather, for convenience, equimultiples of a degree, be set-off from the common centre, the geometry of the figure will show at once the variation in the circular measurements on the circumference of the oval.

Now, a *mean* degree of the earth's meridian is the average length of these three hundred and sixty unequal measurements, and it is obtained by dividing the length of the meridian by three hundred and sixty. Astronomers have measured the earth's meridian and found it to be 131,259,287 English feet. Dividing this by three hundred and sixty we get 364,609·13 feet as the length of a mean degree of the meridian. One-sixtieth of this, then, is a knot; and thus, by division, a knot is found to be 6076·818 feet, or 2025·6 yards, or one mile 265·6 yards.

It will now be convenient to notice that a knot being 6076·818 feet, and a mile being 5280 feet, the proportion of a knot to a mile is very nearly as 6076 is to 5280, or, dividing by four, as 1519 is

to 1320, which is very nearly as 15 to 13. So that, for ordinary purposes, knots may be converted into miles by taking thirteen knots as equal to fifteen miles, and *vice versa*.

A SUMMER THOUGHT.

Dazzling the landscape lies;
Blue, gold, and green—
Even to tear-stained eyes
Beauteous, I ween.

Blue sky, wide-spreading trees,
Green, still, and tall;
Sunshine in golden ease
Slanting o'er all.

Happy hearts wandering,
Sun on them too;
Streamlets meandering
Fair meadows through.

Presently sinks the sun
Crimson to rest;
After his work is done,
Seeks he the west.

Homeward the happy hearts
Stroll o'er the lea;
Silent the stream departs,
Bound for the sea.

Hushed stand the lordly trees,
Sentinels strong;
Whispers the evening breeze
Gently along.

Gray-tinted shadows creep
Over the sky;
Deep in a dreamless sleep
Soon all things lie.

Sorrow seems lost in rest,
Care in repose—
Wrapt in oblivion blest
Earth and her woes.

Only I linger still,
Loth to depart
From these calm scenes that kill
Pain at my heart!

ETHEL IRELAND.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL*.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

A SUMMER DAY IN THE ISLE OF AVALON.

THE Isle of Avalon, like the Isle of Ely and many another geographical misnomer, is endeared to the lovers of the picturesque not a little by the charming inconsistency of its not being an island in sober fact at all, but a peninsula formed by the tiny river Brue, in conjunction with a still smaller rivulet which is nameless. It is truly a region of enchantment and mystery, for on this historic soil stand the crumbling walls of Glastonbury Abbey, the noblest ruin in all England. The history of Glastonbury is a curious instance of the survival of legendary lore interwoven with long-established traditions, and with the recorded facts of a most eventful and romantic chronicle.

The story of the renowned abbey reaches back to the very early days of the Christian era, when a wattled church stood upon the site, and when Joseph of Arimathea (according to the legend) visited the isle and struck his staff into the ground near Glastonbury. This saintly staff—most ancient of crosiers—took root, and grew into the Holy Thorn, which bloomed miraculously every Old Christmas-eve for many hundred years afterwards. The fact remains, in local archives, that a very ancient tree of the medlar genus was cut down in the yard of the abbey church at the time of the suppression, and slips of it were planted in the neighbourhood of Glastonbury; and the trees grown therefrom continue to put forth bloom in early winter whenever the circumstances of the season are favourable. A mild winter is almost invariable in this most interesting district, for it is to be noted that the climate of Somerset is the most equable in the kingdom, as the county is one of the fairest.

It is a beautiful story, this early legend, and it lends additional grace and charm to the singular topography of the Isle of Avalon. Pity it is that ever a doubt should arise as to fact or fiction in the matter—to dissipate the glamour of the monkish tale rather than to think it 'An old and

moving story, that suited well that ruin wild and hoary.'

The ecclesiastical tradition of the abbey is older than the history of the town, Glastonbury market-town being of Saxon origin. It was the 'Glastingaburh,' or Glastings' borough of the West Saxons. The Isle of Avalon itself, a central spot in an eminently fruit-producing county, may possibly be named from the British 'Avilla,' signifying apples. But whatever story of saint or sinner may linger around the sacred precincts of Glastonbury, the most striking of all is the tradition, apocryphal or not, of the burial of the great early British monarch, King Arthur: Arthur of Lyonesse, the great Pendragon of splendid fame, and of many an old-world romantic tale. It has been told that his body was borne hither after the great battle 'among the mountains by the winter sea,' and reverently laid in earth by his faithful Round-Table Knights.

In later times, it is stated, the stone coffin was exhumed by the direction of Henry II., who, according to a quaint description in an old book, caused a deep excavation to be made, laying bare a tombstone with a large plate of lead fixed upon it, which showed the following inscription: 'HIC JACET SEPULTVS INCLITVS REX ARTVRIVS IN INSVLA AVALONIA.' Nine feet below this stone was discovered a coffin made from a hollowed oak-tree containing human bones, which on being examined—so runs the story—were identified as those of the Christian king. What more fitting resting-place could have been found in all the land for the mortal remains of British Arthur!

The magnificent abbey which was subsequently built upon the hallowed ground had already, at the time of Henry II. and Thomas à Becket, attained great repute. It seems to have increased century after century in influence and power, the community of Dominican Friars becoming the wealthiest monastic institution in the kingdom, the head of the house being specially styled Lord Abbot, with a seat in parliament, second in rank only to the Abbot of Westminster. The abbot's rule in Avalon was well nigh supreme, spiritual

and temporal; and no one might enter the isle except by his special permission.

This immense acquisition of wealth and power conduced at last, as with so many others, to an ultimate downfall at the Reformation, when Abbot Richard Withering stoutly refused to acknowledge the king's supremacy or to surrender the abbey and some £3311, 7s. 4d. per annum.

This courageous abbot, so worthy of a better fate, was tried for his high offence before King Henry's commissioners at Wells, and condemned with two of his monks to be hanged—a ruthless sentence. At this sad and significant audit it was shown that these unhappy churchmen had concealed a vast amount of abbey treasure; and when that terrible day of reckoning came, had utterly declined to account for it. This triple execution took place on the summit of an adjacent hill—the Torr—in the presence of a concourse of sorrowing people, sadly bewildered, no doubt, at the turn of events. Upon this hill stand the ruins of an ancient church, and sculptured on the front of its lofty tower is a singular representation of the Archangel Michael weighing in a pair of scales a copy of the Holy Scriptures against the Evil One, and showing Satan to be greatly wanting when thus tried in the balance. From this historic Torr is to be viewed one of the finest landscapes in England.

At the period of the Reformation the beautiful abbey, in addition to the disruption of all else, was unroofed and otherwise dismantled, remaining in picturesque decay a memorial of misdirected or over-carried zeal. The grand proportions and beauty of the Gothic stonework are still in evidence in the ruins; but the greater part has gone for vulgar building purposes, much of it actually being used to form a roadway some two miles across a morass to Wells—a sacred way, truly.

To Wells Cathedral went the old abbey clock, which was one of the wonders of Glastonbury and of Europe. In a transept of the cathedral it is still to be seen in good working order. This very curious piece of antiquity is placed some thirty feet high in the interior of one of the lofty side-aisles; and close at hand in an alcove sits a painted effigy of a manikin with its feet dangling over a silvery-tongued bell upon which the manikin's heels ring out the chimes. As the moment for striking the hour approaches, a premonitory clicking is audible from within the clock, and presently a remarkable spectacle is beheld. From behind the old dial emerges a procession of armed knightly figures on horseback, moving two and two in stately military fashion upon a semi-circular platform; and as the foremost pair arrive at a certain point in their march, the outside knight raises his lance, and with trenchant blow strikes his comrade down to the saddle-bow. Instantly, within the clock a bell is struck and *one* is sounded. Thereupon, the stricken horseman quickly rears his crest aloft, and the procession passes behind the dial. This process is repeated until the required number of strokes has been given and the time of day is told.

The impression left on the mind of the spectator witnessing this performance, perhaps unexpectedly, is one of astonishment, and of admiration of the ingenious mechanical contrivance, the work pro-

bably of some devoted artist of the fifteenth century. Certainly a wonderful clock; telling its tale of fleeting time in the dreamy calm of the cathedral aisle, amidst the woful monitions of brief mortal life laid all around in graven brass or sculptured marble.

The silent streets of Glastonbury, with two or three fine old inns—one of them an ancient *hospitium*—a medieval cross, and here and there a dim relic of domestic masonry, suggestive of the architecture of the abbey hard by, are of old-world interest. It is a picture of still-life there, seeming more still than the hush of minster cities, because more melancholy; and not even the near approach of the railway can effect much change or rouse the old place quite to the ordinary standard of life, even where most secluded, of the nineteenth century. The noble ruins everywhere visible in the little town forbid the thought. Clad in a robe of kindly ivy, they appeal to the imagination like an endless sermon—in stone. Ivy-clad, but not concealed! Beateous still!

Some little distance from the abbey is the Abbot's Kitchen, a stone-built edifice, remaining much as when the bustling cooks had left it, and reform had quenched their fires. An enormous smoke-stained cone it is, and a striking object enough in the village landscape. One thinks, in walking round its ample space, of the merry times that have been there—of the hospitality to rich and poor of which it is the token. Time was not out of joint then; and the world's work had scarcely begun. It is saddening, withal, to view this grotesque temple of the culinary art rearing its solitary sombre dignity in that fair Somersetshire meadow, with the gentle kine and wistful-faced sheep browsing or nibbling on a joyous summer morning around its frowning walls, and to think of all that has departed with the last wreath of smoke from its vanished fires!

The time-worn truism that good and evil are very much mixed in the world is surely abundantly exemplified by those old monkish relics of feasting and almsgiving. For the latter, modern society has substituted the workhouse; and that consummation, if nothing else, induces the regret that when necessary reform should, in the natural growth of events, become due, whatever of good may be coexisting with the abolished evil should be swept away also, and for ever.

DUMARESQ'S DAUGHTER.

CHAPTER XXVIII.—QUESTIONS OF INHERITANCE.

ABOUT the same time, Reginald Mansel, Esquire, of Petherton Episcopi, happening to be up in town on private business, had occasion to call on his father's old friend, that distinguished sailor, Admiral John Antony Rolt, of the Senior United Service.

'So the heiress lives down your way?' Admiral Rolt observed, puckering up his small eyes at the end of some desultory conversation—and always eager, after his kind, to improve every possible source of information. 'Miss Psyche Dumaresq, I mean: precious odd name, Psyche: rather pride myself, as an old salt, on knowing

how to pronounce it. There was a *Psyche* in the Navy List once, I remember, a wooden gun-boat—on the Pacific station, when I commanded the *Skylark*; though she went to pieces at last in the China seas—poor M'Nab sank down to Davy Jones's locker in her—and was never put together again. Smart craft, very: and *this* Miss *Psyche*'s a tidy young lady, too, I'm told: taut, neat, and clipper-rigged. Well, she comes into all Charlie Linnell's money.'

'Impossible!' Mansel answered with promptitude. 'I've never heard a word of it. She's a great friend of my wife's, and a very nice girl in her way, no doubt; and Linnell fell in love with her: but she wouldn't accept him. He's left her nothing. If he had, I'm sure we'd have been the first to hear of it.'

'Well, it's a very odd case,' the Admiral continued, pursing up his little pig's eyes even smaller than before—'a very odd case as ever I heard of. She isn't to know of it for another year, but I'm sure I'm right. I've been talking it over to-day with Linnell's half-brother Frank—the parson in Northumberland: and Frank doesn't quite see his way out of it. Precious awkward for the parson, there's no denying it.'

Reginald Mansel started. 'Why, I thought the half-brother was dead,' he exclaimed in surprise. 'Killed in a railway accident. My wife certainly told me so.'

'Ah; that's just where it is,' the Admiral answered, rubbing his fat hands with profound gusto. 'As fine a muddle as ever you saw in your life. A perfect godsend for the Court of Chancery. Killed sure enough: so he was—in the newspapers: smashed to atoms in the Doncaster collision, they reported at first. You remember the accident—pig-iron and so forth. But you see, when they pick out a lot of bodies, pell-mell, from a jolly good smash, and stack 'em along in the hospital, they're not so very particular, just at the first beginning, whether any one fellow among 'em happens to be still breathing, or whether he doesn't. So they telegraphed up to London post haste, in the list of killed, "Reverend Francis Austen Linnell, Vicar of Thingumbob-cum-Whatyoumaycallit, Northumberland." Correspondents are in such a precious hurry nowadays to supply the very latest news to their particular print, that you can't expect them to hang dawdling about in a ward, on the watch till the breath's well out of a man's body.' And the Admiral chuckled low to himself, musically.

'Then you mean to say the fellow isn't dead after all?' Mansel exclaimed, astonished. 'It was a mistaken rumour!'

'Dead! my dear sir; why, I tell you, he was lurching with me at the Pothouse—you know the Pothouse?—my other club—not its official name—only this very morning. And a prettier muddle than those papers made of it you never heard. It was three whole days before they plucked up courage to announce their little error, and state that the Reverend Frank was not quite gone, only seriously wounded. Meanwhile, Sir Austen and the painter man went off in a hurry to Khartoum without seeing

the correction; and to the day of their death, never heard at all that the parson had turned up well and alive again. It was really most unfortunate. Frank Linnell believes those papers have done him out of all the Linnell money—Sir Austen's and the other man's. Only, you see, he doesn't quite know how he can go to work to get it all back again. It's a ticklish job, I admit; but I wouldn't give much, all the same—with a parson against her—for Miss *Psyche* Dumaresq's chances of the property.'

'Surely, though, if Linnell left his money by will to Miss Dumaresq, she'd get it, in any case,' Mansel objected incredulously.

The Admiral stared hard at him, and smiled a knowing smile. 'You don't understand the glorious uncertainty of the law,' he answered, enchanted. Then, with all the intense enjoyment of the male old woman, he proceeded to detail to his country acquaintance the whole long story of the Linnell family, and their various complications—*Bellerophon*, *Cockatrice*, Sally Withers, the Dean's daughter, and the rest of it—exactly as it all envisaged itself in full to his own lively and by no means too scrupulous imagination. Mansel listened with profound attention; but when the Admiral had finished, he ventured to put in cautiously: 'Still, I don't quite understand how all this can interfere with *Psyche*'s inheritance of Charles Linnell's money—if, as you say, he's really left it to her.'

'Why, here's the point, don't you see?' the Admiral answered cheerily, button-holing his listener and enforcing his argument with one fat uplifted forefinger. 'Charles Linnell, as I understand, came up to town from your place, Petherton, on the very day after his half-brother Frank was declared dead in the morning papers. So far, so good. But that same night, as I learn from one of the witnesses to the deed, he made his will, and Sir Austen signed it—said will leaving everything he died possessed of to the young lady, unknown, of the name of *Psyche*. Now, Frank Linnell's contention is that Sir Austen and Charles arrived at an understanding, *under the impression*, and the Admiral brought down his fat forefinger on his knee to enforce his point: '*under the impression* that he, Frank, was dead and done for; which of course in actual fact he wasn't. Therefore, he argues, the will is accordingly null and void, and he himself ought to come into the money.'

'But how can he,' Mansel inquired, smiling, 'if he's really illegitimate? By law, as I'm rightly informed, he and Charles Linnell are not considered to be even related.'

The Admiral shrugged his shoulders and pursed his mouth firmly. 'Well, I haven't quite mastered all the ins and the outs of it,' he answered with candour. 'It's a trifle confused for an old salt like me; but I believe the learned counsel who understand the law get at it something like this, d'ye see. It all depends upon which of the two, Sir Austen or Charles Linnell, was killed first at Khartoum. If Charles was killed first, then the Reverend Frank asserts—you understand—this will being null and void, owing to unsound mind, errors of fact, want of proper disposing intent, and other causes—that Sir Austen, as next-of-kin and sole heir-at-law, inherited the pill-money. For that, he relies upon

Charles Linnell's legitimacy. But on the other hand, Charles Linnell being now well out of the way, and unable to prove or disprove anything, the Reverend Frank also goes in, as an alternative, for claiming that he's actually legitimate himself, and denying proof of Miss Sally Violet's marriage. On that point, there's nobody now who can bring up good evidence. So he stands to win either way. If he's legitimate himself, he's a Baronet anyhow, and he comes in to the reversion of Thorpe Manor. If he's not legitimate, he's no Baronet, to be sure, and the entail fails; but the fun of it is, he gets Sir Austen's personal estate for all that, through his mother, the Dean's daughter, who was Sir Austen's second cousin, twice removed, or something of the sort, and whose case is covered by Sir Austen's settlements. The old father did that—the Peninsular man, you know—after the bigamy came out. He insisted upon putting in Frank Linnell by name in the settlements, as heir to the personality, irrespective of the question of his birth altogether. And in the personality the Reverend Frank now asserts he reckons in Charles Linnell's pill-money.'

Mansel drew his hand across his brow confusedly. 'It is a trifle mixed,' he answered with a puzzled air. 'But it's decidedly clever. I should think it ought to prove a perfect mine of wealth to the Inner Temple.'

'Mine of wealth!' the Admiral echoed with a snort of delight. 'I believe you, my boy. Golconda or Kimberley isn't in it by comparison. The whole estate won't cover the law charges. For you see, there's the lovely question to decide beforehand, *did* Sir Austen or his cousin die first?—and till that's settled, nothing fixed can be done about the property. Well, Frank Linnell doesn't mean to let the question drop. He has a twelvemonth to spare, during which time he's going to work like a nigger to prevent the lady with the classical name from coming into the property.—Of course you won't mention a word of this to her? I tell it you in confidence.—That's all right. Thank you.—So Frank thinks of going to Egypt and up the Nile this very next winter, as ever is, to see if he can collect any evidence anywhere as to which was killed first—his half-brother Charles, or his cousin Sir Austen. And between you and me, sir—if only you knew these Egyptian fellows as well as I do—the Reverend Frank must be a much more simple-minded person than I take him to be if he doesn't get at least half-a-dozen green-turbaned, one-eyed sheikhs to swear by the beard of the Prophet, till all's blue, that they saw Charles Linnell with their own eyes lying dead at Khartoum, in any position that seems most convenient, while Sir Austen sat in a respectful attitude, shedding a decorous tear or two above his mangled body. An Egyptian, sir,' the Admiral continued, blinking his small eyes even more vigorously than was his wont—'an Egyptian would swear away his own father's life, bless your soul, for a tin piastre.'

'Then you think whatever evidence is wanted will be duly forthcoming?' Mansel asked, dubiously.

'Think? I don't think. I know it, unless the Reverend Frank's a born fool. But even after he's got it, don't you see, there's a lot

more still left to prove. Yet even so, he stands to play a winning card either way. If he's legitimate, he's a Baronet of Thorpe Manor; and if he isn't, he's heir all the same to Sir Austen's personality.' And the Admiral chuckled.

Mansel looked at him with a curious air of suspended judgment. 'After all,' he said slowly, in his critical way, 'you're taking a great deal for granted, aren't you? How on earth do we know, when one comes to think of it, that either of the Linnells is really dead at all? How on earth do we know they aren't still cooped up in Khartoum, as O'Donovan was in Merv, you recollect, and that they mayn't turn up unexpectedly some day to defeat all these hasty surmises and guesses? You can't prove a man's will till you've first proved he's dead; and who's to say that either of the Linnells is dead, when one comes to face it?'

The Admiral threw back his head and laughed internally. 'Dead!' he answered, much amused. 'Of course they're dead. As dead as mutton! As dead as a door-nail! As dead as Julius Caesar! Do you think the Mahdi's people, when once they got in, would leave a Christian soul alive in Khartoum? My dear fellow, you don't know these Egyptians and Soudanese as well as I do—I was out for a year on the Red Sea station. They'd cut every blessed throat in the whole garrison. There's not a Christian soul alive to-day in Khartoum.'

CHAPTER XXIX.—FRESH ACQUAINTANCES.

It was with a feeling very nearly akin to relief that Psyche found herself, some six weeks later, in a pretty little bedroom in a Moorish villa on the sun-smitten hills of Mustapha Supérieur.

'Why, I know the very place for you,' Geraldine Maitland exclaimed with delight, when Psyche informed her on her return to Petherton that medical authority, two deep, had prescribed Algiers for their joint indispositions. 'A dear little *pension* on the Mustapha slope. It's as clean as a pin, and just like a home; and it's kept by an English officer's widow, a Mrs Holliday. It's not so very dear, either,' she hastened to add, seeing Psyche's face growing faintly incredulous. 'They'd take in friends of ours at special rates. Mamma has sent them such lots of boarders.'

And indeed the rates, as quoted to Haviland Dumaresq some days later, in Mrs Holliday's letter, were very special—very special indeed; for a reason which Geraldine Maitland knew best, and which she took care to keep to herself very strictly. 'I should feel *greatly* obliged, however,' Mrs Holliday wrote, underlining the *greatly* with two feminine bars, 'if you would have the kindness to refrain from mentioning these terms I quote to any other of the visitors at the villa, as they are considerably below our usual charges, to meet the wishes of my friend Mrs Maitland.'

Oh the journey south! The rest and change of it! The delight of getting away from the Wren's Nest, with its endless obtrusive memories of Linnell! The calm of travel; the momentary oblivion! Paris, Dijon, the Rhone, Marseilles! For twenty-four hours, Psyche almost forgot herself.

The dear little *pension* on the Mustapha slope,

too, how thoroughly it deserved Geraldine Maitland's judicious commendation! It was very pretty and very home-like. After thirty hours' tossing on the faithless Mediterranean—bluest but most treacherous of all known seas—and that long drive up the dusty road through the vivid town from the quays at Algiers, Psyche was right glad to rest herself at last in that dainty little bedroom, at the Villa des Orangers, and to look out of the arcaded Moorish window at the palms and aloes that diversified the garden.

True enough, as Dr Godichau had confidently predicted, her eyesight came back to her for the nonce at a bound. Wisdom was justified of all her children. Psyche had seen everything all the way up through those crowded streets: she saw everything still with perfect distinctness in the arcades and gardens of that quaint old *pension*.

It was an antique Moorish country-house, all whitewashed walls and horse-shoe arches, planted on the side of a tiny ravine, near the very summit of an Algerian hill, some six hundred feet above a deep blue bay of that treacherous and all too beautiful Mediterranean. Through the jealously barred and grated windows of a deep-set chamber in what was once the harem of the old Turkish proprietor, Psyche's eye just caught faint glimpses westward of a feathery date-palm, a jungle of loquat trees, and a ruddy hillside of basking sandstone, red as the familiar South Hams of Devonshire. Beyond, the ravine displayed in further perspective a tangled cane-brake, a steep road down whose tortuous slope an old Arab countryman was defiling slowly cross-legged on his pannier-laden donkey, and a picturesque wine factory, whose snow-white archways and low stories were all gracefully pinked out along their constructive lines with decorative string-courses of Oriental tile-work. A peep of the dim blue Atlas to eastward across a misty plain completed the view from the windows of that quaintly pretty room—a view which hardly needed the domed and arcaded mansion on the hill-top behind, or the veiled forms of the Moorish women gliding noiselessly down the pathway opposite, to assure Psyche that this was indeed in very truth that wonderful Africa.

Without and within, to say the truth, to Dumaresq and his daughter the Oriental character of house and surroundings was everywhere most delightfully and undeniably apparent. The tiny round-topped slits pierced through the thickness of the massive wall; the floor covered with Damascus tiles and overlaid in part with pretty Eastern rugs; the pale-green dado and light-blue frieze of distemper on the sides, separated from one another by a verse of the Koran in breezy Arabic letters running round the room between them as a continuous border; the graceful hangings and delicately-coloured drapery—all charmed Psyche, weary and heart-sick though she was, with a delicious vague sense of Orientalism and novelty. As she lay on the crimson and blue divan by the open window, rich perfumed whiffs of the Japanese medlars in full flower floated in upon the cool yet summer-like breeze; and the hillside opposite hummed with insects busy among the blossoms of the great African clematis that fell in cataracts over the rocks and branches. For a moment she almost forgot her sorrow; the oculist was right; what she needed was a life of pure perception.

To Dumaresq, the charm of these novel surroundings was even greater and more striking than to his heart-broken Psyche. He admired throughout the house the infinite diversity and picturesqueness of the arches; here a semicircular doorway with richly-carved decorations in Arabesque patterns; there a pointed Moorish arcade of Saracenic type; and yonder, again, a flat-topped horse-shoe arch of peculiarly curved and bulging gracefulness, never to be seen anywhere else save here in Algeria. The long rambling passages, cool and gloomy for the hot African summer; the endless doors and nooks and niches; the grated windows and flat roof; the Oriental terrace; the up-and-down steps and uneven levels of the quaint little garden—formed a very ideal scene for an Arabian night's adventure of the fine old pattern. The gray old philosopher, startled into a momentary fit of imagination, almost expected to see Bluebeard's wife emerge unexpectedly from some darkling doorway, or the One-eyed Calender look in upon him unawares through the deep-set window-holes that gave upon the garden.

Yet it was pleasant to find, in spite of the persistent odour of Islam which pervaded the house, that the villa had been modernised and Anglicised after all in a way to suit the most luxurious English taste. It was four o'clock when they arrived at their temporary home, and at five a smiling little Swiss maid brought in a tea-tray with a steaming pot that reminded Psyche of dear old-fashioned Petherton. Tea and the Arabesque are too much all at once. So much modern comfort seems half out of place, side by side with such delicious antique Orientalism.

Psyche would have liked them to spend that evening by themselves in their own rooms; but her father overruled her wishes in that respect. It was best for her, he said, to go out to dinner: to mix at once with the world of Algiers; to conquer these morbid desires for seclusion; to throw herself as far as possible into the new situation. And Psyche, now clay in the potter's hands, yielded unwillingly to his wishes.

At the table-d'hôte they were shown to seats near the bottom of the table by a Swiss waiter with his hair cut short and a general expression of bland good-nature pervading all his stumpy features. The seats opposite them were already occupied by two tall and very stately girls, accompanied by a young man of an open and naïf but somewhat unfinished type of countenance.

The girls quite frightened Psyche at the very first glance; they looked so queenly and magnificent and awful. Geraldine Maitland herself was hardly half so grand. Their ears were thin and delicately pink; their complexions shone with a transparent lustre; their necks were high and exquisitely moulded; their hands might have come out of a portrait of Sir Peter Lely's. Altogether, Psyche made up her mind at once that the strangers were, at the very least, duchesses: ladies of the *ancien régime* to a certainty, so calm and clear-cut and dainty were their lineaments. They weren't English; she could see that at a glance: there was something very foreign in the cut of their figures and of their rich dresses. Psyche was sure she would never be able to say

a word to them: so much high-born stateliness fairly took her breath away.

Presently, a few more visitors came in, and seating themselves, began to talk across the table with perfect sang-froid to the magnificent strangers. Psyche envied them their boldness of address. How could they dare to approach such aristocrats? 'Well, did you have your photographs taken after all, Miss Vanrenen?' a lady opposite asked with a smile of recognition.

'No, ma'am,' the tallest and stateliest of the beautiful girls answered promptly, with a polite nod. 'We went into the city and had a lovely time, but we couldn't agree upon the currency question. We asked the photographer his lowest cash quotation for doing us in a group under the doorway here in Arab costume, and he gave us an estimate for as much as comes to fourteen dollars. Corona and I don't mind expense, but we're dead against extortion; and we consider fourteen dollars for taking your likeness in an Arab dress downright extortionate. So we concluded to do without the pictures for the present and to save our specie for a better occasion.'

'I reckon,' the second queenly creature remarked with a graceful bow, 'we can be taken just as well on Vesuvius when we go along to Naples.'

'That's so,' the first divine efflorescence answered acquiescent. 'We don't stand out for the Arab dress in itself, you see, ma'am: we only want to be taken somewhere, with something distinctively European or African loafing around in the background—a mosque, or a cathedral, or a burning mountain—so as we can take the picture home and let folks see we're not a fraud; we've really travelled up and down the world a bit.'

'Still,' the brother said, looking round at his sisters with a half-regretful air, 'I must say I wanted Sirena to go the fourteen dollars blind for all that.—You see, Mrs Prendergast, we might have been taken all in a group under the Moorish archway there; and Miss Maitland would have joined us to complete the picture in that elegant airy Arab get-up of hers.'

'You know Miss Maitland then?' Psyche ventured to put in timidly, with the natural diffidence of the latest comer.

'Cyrus don't know anybody else, almost,' the taller girl replied with a smile. 'He was over here alone from Amurrica last fall, and spent the winter by himself in this city; and every letter he wrote us home was a sort of a bulletin about Geraldine Maitland. It was Geraldine Maitland went here; Geraldine Maitland went there; Geraldine Maitland says this; Geraldine Maitland thinks that; till we began to conclude at last for ourselves there weren't any other young ladies at all in Europe except Geraldine Maitland. So Corona and I—that's my sister—we said to ourselves we'd come along this year and inspect for ourselves what sort of a person this girl Geraldine was, before Cyrus brought her home anyway for a permanency.'

'Now, Sirena!' the young man interposed, looking very sheepish: 'I'm a modest man. Don't reveal my blushes.'

Psyche was fairly taken aback at this boldness of speech. She had met very few Americans before, and was little accustomed to so much

freedom in the public discussion of unfinished matrimonial projects; but her awe at the queenly young women outlived even the discovery of their Western accent, and she only said in a very timid tone: 'We know Miss Maitland, too. She's a very great friend of mine.'

'Then I guess Cyrus and you'll get on together,' Sirena said briskly, 'for whoever likes Geraldine Maitland confers a private obligation, I conjecture, upon Cyrus.'

'We're going to have a very great honour here,' the young man Cyrus interposed sharply, with an evident desire to change the conversation. 'Have you heard, sir, that the great philosopher, Haviland Dumaresq, intends to winter in this city?'

At the words, Psyche coloured up to the roots of her hair; but her father, bowing his stateliest and most distant bow, made answer severely, without moving a muscle of that stoical face: 'Sir, my name is Haviland Dumaresq.'

He had scarcely spoken the word, when Cyrus Vanrenen rose from his seat and walked round the table with immense enthusiasm but great deliberation. 'Mr Dumaresq,' he said, seizing the old man's hand in his and wringing it hard, 'allow me the pleasure. Well, now, this is a very great honour, sir. I haven't read your books, Mr Dumaresq—at least to any extent, being otherwise engaged myself in business—but I know your name well; and in my country, sir, your works are much admired and highly respected. In the city where I reside—you don't happen to know Cincinnati? No; I thought as much—we set very great store by your valuable writings. The *Cincinnati Observer*, I recollect on one occasion, described you in one of its editorial columns as "the greatest metaphysician of this or any other age." That was high praise, Mr Dumaresq, from the editorial columns of such an influential print as the *Cincinnati Observer*.'

'I'm glad to learn that I have deserved the commendation of so critical an authority upon philosophical questions,' Haviland Dumaresq answered with grave irony.

But his delicate sarcasm was thrown away upon the honest and innocent young American. That any one could feel otherwise than pleased and flattered at the polite attentions of the *Cincinnati Observer* was an idea that could never for a moment have entered his good straightforward business head. 'Yes; it's a right smart paper,' he went on with friendly communicativeness. 'Largest circulation of any journal in the State of Ohio: and down the Mississippi Valley we go it blind on culture nowadays, I can tell you. Culture's on the boom in the West at present. No journal that didn't go it blind on culture and philosophy would stand a chance of success in the struggle for life in the Mississippi Valley. Survival of the fittest's our rule out there. We're down upon frauds, but we respect live concerns. If ever you were to light out for Cincinnati, Mr Dumaresq, you'd find our citizens very appreciative: they'd be honoured to give you a warm welcome.'

'I am much obliged to them for their vivid personal interest in philosophy,' Haviland Dumaresq answered, going on with his soup, and smiling inwardly.

'And is this your daughter, sir?' Cyrus asked

once more, as he regained his place and glanced across at Psyche.

Psyche bowed, and faltered 'Yes' with very mixed feelings at being thus trotted out before a whole tableful of utter strangers.

'It must be a very great privilege, Miss Dumaresq,' Sirena remarked, in a clear unembarrassed American voice, right across the table, 'to pass your life and receive your education in the midst of such cultured European surroundings. Where did you make your recitations? I suppose, now, you've graduated?'

'I've *what*?' Psyche repeated, very much at sea.

'I suppose you've graduated?' Sirena said once more with perfect self-possession. 'Completed the curriculum at some European academy?'

'Oh no,' Psyche answered, catching at her drift, and blushing crimson by this time, for the eyes of all the table were upon her. 'I—I'm not at all learned. I've been brought up at home. I never went away to school even anywhere.'

'Your Pappa's been education enough by himself, I guess,' Corona put in with a friendly nod over the table towards Dumaresq: from which gesture Psyche concluded that the grand young lady meant to allude obliquely to her father.

'I expect you're a philosopher yourself by this time,' Sirena went on, glancing over at her curiously. 'Corona and I graduated at Vassar, and the philosophy class there read the first volume of the Encyclopædic Philosophy for their second year's recitation.—It's stiff, Mr Dumaresq, but our girls like it. Most of our students accept your fundamentals. They adopt your view of the cosmical substratum.'

Dumaresq twirled his gray moustache nervously. Criticism of this type was a decided novelty to him. 'It will be a pleasure to me to think,' he murmured, half aloud, 'as I approach my end, that my labours are approved of by the young ladies of the philosophy class at Vassar College. Few previous philosophers have been cheered by such success. Descartes and Leibnitz went to their graves unrefreshed by the applause of the young ladies of Vassar.'

'But in Amurrica nowadays we manage things better,' Sirena answered, dashing on, all unconscious still of his undercurrent of banter. 'Our women read and think some, Mr Dumaresq, I assure you. Your philosophy's very much studied in Cincinnati. We run a Dumaresquian Society of our own, lately inaugurated in our city; and when the members learn you're over here in Algiers with us, I expect the ladies and gentlemen of the club'll send along the pages out of their birthday books to get you to write your autograph on them. There's a heap of intelligent appreciation of literatoor in Amurrica: most all of us'd be proud to have your autograph.'

'That's what I admire at so much in Europe,' Cyrus interposed with a pensive air. 'It brings you into contact with literatoor and art in a way you don't get it across our side. Why, lots of our ladies'd give their eyes almost to be brought up in the way Miss Dumaresq's been. In the thick of the literary society of Europe!'

Psyche smiled and answered nothing. Fortunately, at that moment another member of the party intervened, and spared poor Psyche's blushes any further.

As they sat for a while in their own little room before retiring for their first night in Africa, Haviland Dumaresq remarked to his daughter with a slight shudder: 'Did you ever meet anybody so terrible, Psyche, as that awful American man and his unspeakable sisters? Such a quality as reserve seems utterly unknown to them.'

'But do you know, Papa,' Psyche answered half smiling, 'they're really such kind good girls after all. They almost made me sink under the table with shame at dinner, of course; but I've been talking with them all the evening in the salon since, and I find in spite of their terrible ways they're so sweet and frank and natural for all that. One of them—the one they call Sirena—told me I was a "real nice girl;" and when she said it, I could almost have kissed her, she seemed so kind and sympathetic and friendly.'

'Oh, the women are well enough,' her father answered, with masculine tolerance: most men will tolerate a pretty girl, no matter how vulgar. 'But the brother! what a specimen of Cincinnati culture! It almost made me ashamed to think so many of my books had been sold in America when I reflected that that was the kind of man who must mostly buy them. And then the fulsome-ness of the fellow's flattery! Why couldn't he leave poor philosophy alone? What had philosophy ever done to hurt him? I remember Mill's saying to me once: "A thinker should never go into general society unless he knows he can go as a leader and a prophet." That young man would go far to make one say the exact contrary; a thinker should never go at all, unless he knows he can pass in the crowd and remain unnoticed.'

(To be continued.)

NORRLAND AND ITS TIMBER TRADE.

NORRLAND is the northernmost and largest of the three great divisions of Sweden, and comprises with Lapland, which really belongs to it, more than one-half of the whole area of the country. It extends from the southern to the northern end of the western shore of the Gulf of Bothnia; and the northern part of it, which is within the Arctic Circle, is during the greater part of the year a cold and cheerless region. This territory contains a large proportion of the forest-land, and, if we include the adjoining *län* of Kopparberg and the district of Dannemora, nearly all the mineral wealth of the country. And the vast resources of the province find an outlet through the many seaports on the coast to all parts of the world. The population varies greatly, and ranges from the small percentage of about thirty-five inhabitants to the square mile in the south to a merely nominal one in the north, where the meagre fixed population is supplemented by tribes of wandering Lapps.

The timber industry assumes every year a more prominent place in the export list of Swedish trade. Gefle, Söderhamn, Hudiksvall, Sundsvall, Luleå, and other smaller towns on the western side of the Gulf of Bothnia, now annually export many thousand standards of wood to Great Britain, Germany, France, and other countries, including even distant Australia. The

greater part of this wood consists of 'deals' and 'battens'—simply dressed or finished planks of various lengths and sizes. But large quantities of doors, window-frames, and similar manufactured articles are also shipped to this and to other countries. The volume of trade in these goods increases largely every year; and last year the quantity shipped from Stockholm was five times that of 1888. The trade in wood-pulp has also made great strides of late years; indeed, so many factories have been erected for its manufacture that the consequent over-production has sent the price of the article down to a point which is scarcely remunerative to the producer. Gefle, a pretty little town near the southern end of the Gulf, alone exported some one hundred and fifteen thousand standards of wood last year, this quantity showing an appreciable increase over that shipped in the preceding year.

The wood is cut during the winter, and the logs are floated down the rivers in the spring, when the volume of water running seawards is augmented by the melting of the ice and snow. It is collected at the coast-towns, where it is sawn into planks of various lengths. It is then stacked and left to dry, and is exported during the summer and autumn. In Gefle and other timber ports the vessels usually anchor some distance from the town, and the wood is taken out to them in large covered lighters. It is wonderful how little space is wasted in stowing the wood on board. A vessel bound from some timber port with a deck-load of deals frequently ten feet high, which perhaps, owing to her empty bunkers, gives her a heavy list, is a common enough sight in our waters; and the practice of taking these large deck-loads is unfortunately an increasing evil. Each captain piles timber upon his ship in the hope of carrying a larger cargo than his predecessor. In many cases even the safety of the ship is jeopardised and the lives of the crew risked for the sake of a few pounds' extra freight. The owners are mainly responsible for this state of affairs, with which the legislature will sooner or later have to deal. Whether the recent Merchant Shipping Act will do much in this direction remains to be seen.

The forests of Sweden cover nearly half of the whole surface of the country. These forests, which are chiefly of pine and fir, are found in nearly all parts of the kingdom; but many of the finest tracts, extending in some cases continuously for eighty miles, occur in the southern districts of Norrland, the greater part of the forest-lands being situated below sixty-four degrees of latitude. The Government owns some thirteen thousand square miles of forest-land, and sets an excellent example to other owners in the management of this property. On many estates quantities of young trees are planted every year to fill up the ever-widening gaps among the mature trees. But sad inroads upon the forests have been made in the iron and copper districts of Dalecarlia and Dannemora, where the trees have been remorselessly cut down to provide charcoal for the smelting furnaces; and in these localities no effort has been made to continue the supply by replanting.

Sweden, besides its progress commercially, is every year becoming a more frequented 'hunting-

ground' for tourists who are tired of the orthodox routes of European travel; and there are few countries which more fully repay a visit. It is a land of vast lakes and countless islands, and, in the summer, a realm of almost perpetual day. The coast scenery is unsurpassed, whether we sight the sandy shores and numerous church spires of the south, or the wilder and more formidable coast of the Gulf of Bothnia. Here the coast-line is bold and striking; and the many islands which stud this rock-bound shore serve both to relieve its bleak appearance and to form natural breakwaters for the pretty little towns and villages which nestle calmly behind. The brush of a Turner or of a Constable could scarcely do full justice to the simple beauty of many of these little towns, with their picturesque white wooden houses peering timidly out of the dark foliage of the universal pine. The commercial value of this tree is responsible for the only disfigurement which occurs in the otherwise beautiful coast, for it has caused the erection upon every suitable spot of sawmills, the tall chimneys and large stacks of timber attached to which frequently mar an enchanting piece of scenery. But the picturesque, here as elsewhere, has to bow low before the necessities of commerce.

The majority of Swedish towns are still built of wood; but some few there are which, owing to the destruction of the old houses by fire, have been rebuilt in a more substantial manner. In the breadth of the streets of these new towns and in some other matters the Swedish architects have set an example which might with advantage be followed by more southern peoples. One cannot but regret the destruction of the old wooden houses with their strange gables and quaint little windows; but what the antiquary has lost the people have no doubt gained in improved sanitation and such-like things.

Gefle, the largest town in Norrland, and the third commercial port in Sweden, which was burnt in 1869, has been almost entirely rebuilt, and is now, for a modern town, as pretty a little place as one could wish to see. The partly land-locked bay, whose shores are covered with pine-trees and a luxurious undergrowth of ferns and moss, forms a natural harbour for the many vessels visiting the place. This bay, and, in fact, the whole of the gulf from here northwards, is usually frozen over in December, and is not open for navigation until May. The mails and merchandise are taken across to the opposite shores of Finland in sleighs, and skating is resorted to as a necessity, as well as a pastime.

Within an easy ride from Gefle, although not strictly in Norrland, is the purely mining town of Falun, in the district of 'Stora' Kopparberg (great copper mountain). It contains copper mines which the natives say are the oldest in Northern Europe, having been worked for upwards of six hundred years. The entrance to the mine is an immense abyss some twelve hundred feet across. The surrounding district is arid and the vegetation scanty, owing to the destructive nature of the fumes from the smelting furnaces. One of the local sights is the grave of a young man, who was lost in these mines so far back as 1670, and whose body was not found until 1719. Romantic tradition says that it was identified by an old woman, who had been the unfortunate

man's sweetheart, and that on being exposed to the air the body became to some extent petrified. It was afterwards placed in a glass case, but gradually crumbled to pieces, and was finally buried in 1740.

The old-fashioned and picturesque Swedish costumes are still to be met with, particularly in the districts of Dalecarlia and Dannemora. The former is probably the wildest and, in many respects, the most interesting part of Sweden, with its bold scenery and the old-world customs and pursuits of its inhabitants, who claim to belong to a race distinct from the more southern Swede. The Lapps, who are fairly numerous in the north, are also an interesting people. Their nomadic habits would cause distraction to the census-taker, whilst their primitive costumes of reindeer skin accentuate their claim to being the most uncivilised race in Europe. Not only is the Lapp's dress primitive, but his ideas about washing and many other civilised customs are also extremely hazy, and one who in a weak moment partook of his cookery would afterwards have ample cause for reflection. The Swedish Lapp is scarcely so civilised as his brother who lives on the Norwegian side, probably from more frequent intercourse with the Russian Lapp, who is the most uncouth specimen of the race extant.

The rural Swede is a contented creature, who pursues his way quietly, undisturbed by Labour Unions and other products of civilisation. In the seaports, on the other hand, the stevedores and labourers are now organised; and at most ports it is impossible to get a ship loaded except through the agency of the local Labour Association. But strikes have so far been averted. The stagnation in the timber trade has for a time checked the export of the staple product of the country, but with the enterprise and capital which are now opening up the many latent resources of Sweden, the commercial outlook is anything but a gloomy one.

THE OLD STUDIO.

CONCLUSION.—THE MASTER-PIECE.

FENWICK was suddenly roused from his reflections by the sound of old Gunning's voice; and as he hastened to the window with some sense of uneasiness, Millward came in and sank down upon the lounge with every sign of agitation.

'What is it?'

Millward looked at Gunning, and Fenwick followed his glance. The old boatman was standing near the window mopping his bald head with a red cotton handkerchief, catching at his breath, and glancing out of his small restless eyes from one artist to the other.

'Ask Gunning. Why doesn't he speak?' said Millward, still agitated.

Fenwick looked at the boatman, who still mopped his brow and rubbed his weather-beaten face.

'Ay, ay,' said Gunning cheerfully. 'But wait a bit, sir, till we get righted. Let's be quite clear what passed between us when going against the tide.'

'What can you mean?' said Millward with

increased impatience. 'Have I not made myself understood?'

Gunning nodded good-humouredly. 'Yes, yes; I'm with you,' said he; 'it's Mr Fenwick who doesn't see the bearings.—And we can't make much headway, sir,' he added, turning to the young artist, 'till it's made clear to you which tack we're on.'

Fenwick could not suppress a smile. 'I think, Millward,' said he, 'that I should be better able to follow Gunning if—when you feel equal to it—you would first give me a few words of explanation.'

Gunning's face beamed. 'That's my meaning,' said he. 'A few words of explanation from you, sir, and we shall make headway at once.'

It now became clear to Fenwick that a consideration for Millward was the secret of old Gunning's reserve. He was preparing the master, in his own honest way, for some startling news; and Millward was too absorbed in his trouble to comprehend the boatman's attitude towards him.

The master was standing, as he so often stood, before his latest work. 'She has never been absent from my thoughts,' said he, seemingly speaking to himself—seemingly forgetting for the moment Fenwick's presence and Gunning's too. 'And as I have seen her in my own mind, approaching womanhood, so I have painted her—yes, painted her as I know she would have looked if she had never gone out of my sight!—She is a woman now,' he went on; 'she has grown up under my hand; she has always been visible to me. Her image is here, as I should have seen it had she lived. I shall always see the face in my work, though I have given up all hope of seeing her.'

No one spoke, though Fenwick exchanged a furtive glance with Gunning.

Suddenly Millward crossed the studio with a quick step, and stopped before an easel that took up a great part of one side of the room. A quantity of drapery was thrown over it. 'I will show you a picture now, Fenwick,' said he, 'which you have never—no one has ever seen.'

Fenwick's curiosity was roused. He had not reflected that any work of the master's might lie hidden there.

'Another picture, Millward?' said he.—'But,' he added, 'is Gunning to wait? I thought you were going to tell me what passed between you.'

'So I was,' said Millward, recollecting himself. 'I am always attaching importance to the least sound upon the river: to a single word!—I was telling Gunning—and I intended telling you months ago—that I lost a child—my only one—before she was five years old. She had been left alone in a boat,' he went on, trying manfully to steady his voice, 'on the river bank below my grounds; and by some accident, or carelessness, the boat drifted from its moorings and disappeared. Whether it sunk or was stolen—whether my little girl was kidnapped or drowned, I don't know. I have had no tidings, and it's now sixteen years ago.'

Catching Fenwick's eye at this point, Gunning nodded to him, as if anxious to confirm Millward's statement.

'I told Gunning about this,' the master resumed, 'because he happened to mention, in a casual way, that he had saved some lives in his time.—But why,' Millward added—'why he suddenly turned the boat's head, almost before I had finished my story, and rowed home in such hot haste, I could not understand. I foolishly thought from his manner—I don't think so now—that he knew something about my child.—But look at this!' And as he spoke, the master detached the drapery from the easel and brought a large picture to light.

Meanwhile, old Gunning had taken a pair of spectacles from a wooden case and had with difficulty adjusted them. An exclamation now escaped him; for this painting had all the effect upon the boatman, and upon Fenwick too, that Millward could have desired had he premeditated a surprise. For a moment—with such magic power had the master painted every detail of the work—Gunning might well have imagined that Millward had drawn a window-curtain aside, instead of uncovering a picture, and had given them an actual glimpse of the Thames. Not only was the frame of the picture the size of the window-frames, but the whole subject was marvellously realistic. The scene was by moonlight; and in the foreground of the picture was the old terrace, just as it might be seen from one of the studio windows, with the decrepit notice-board, the mossy stonework, and the crumbling balustrade. In the background of the picture, out on the river, was a young girl on the point of drowning. An overturned boat was near at hand, drifting with the tide.

'Now, you know all,' said Millward, with his eyes still upon the painting. 'This is the picture that has haunted me all these years.'

'Ay,' Gunning now broke out in a cheery voice; and having wiped his spectacles with the red cotton handkerchief, he took up one of Millward's smaller pictures. 'But how's this, Mr Fenwick? Why, here she is—asking Mr Millward's pardon—here she is again! And yet he's telling us how she was drowned.' He shook his head incredulously, and selecting another picture went on, holding it at arm's length from him. 'Eight year old here; ain't she? A merry child!' said Gunning criticisingly. 'And like her too—like what she would have been, leastways, had she survived.—Dear me,' he added, 'what a pity it was, Mr Fenwick, no one was by to save her; no old boatman such as me, cruising about! What a pity!' He took up another painting while he spoke, and turned it about. 'Why, she's ten now,' said he—'or might it be eleven?'

'Eleven years old,' said the master, 'when I painted that.'

'And here she is when twelve!' exclaimed the boatman in the same cheery tone.—'And this is her, I'll be bound, at fourteen. Why, she has had her portrait painted, and unbeknown to her, on well-nigh all her birthdays, as it were!' A moment's pause, and Gunning added: 'How she would have enjoyed a glance at herself! Why, it's just like peeping into her own bright looking-glass!—But no,' he concluded, becoming sceptical again; 'she was never drowned.'

Fenwick had been observing Gunning closely.

His honest voice, with something pathetic in its pleasant tone, confirmed him in his surmise—if confirmation were needed. This girl, who was probably peeping at herself in pictures on the staircase, or in the corridor above, was Millward's daughter. And Fenwick now noticed that Gunning's eye had at last met the master's, and that the truth was breaking in upon him too. Seeing that Millward was too overcome to speak, and yet appeared anxious to question the boatman, he said: 'Now, Gunning, what do you know of this business? Let's hear all about it.'

'I will, sir. And it may seem strange to you, said Gunning, 'and equally so to Mr Millward, that I should have never mentioned before what I'm going to tell you now. But I had a reason, as you'll soon see.' He looked at Millward and resumed. 'I've been a waterman, sir, plying in this reach these forty years. One evening, while rowing home after a day's fishing along with a customer, some sixteen years ago, I heard a child's cry. It came from the Surrey bank, as I reckoned, and I pulled alongside. It proved to be an infant, Mr Millward, of four year old or thereabout.'

'Did you,' Millward eagerly demanded—'did you ask the child its name?'

Gunning took off his spectacles, nodded at the master, and replied: 'I've no thought of deceiving you. Her name as she told it to me was Niobe. I rowed the child home in my boat,' he concluded; 'and my own daughter, who had lately got married, took her in tow. We've called her Niobe ever since.'

Millward sank into a chair, and for a while Gunning's words seemed to deprive him of the power to speak. But he recovered himself at last, and rising, went towards the door. 'Take me to her,' said he, 'to your house, Gunning—wherever she is'—

Fenwick now interposed. 'Millward,' said he, 'stay one moment! The story which you began—which Gunning continued—I can finish. You will remember my asking you—and I even fear my thoughtless words must have pained you—to bring your model back with you to-night?'

'Yes; I remember.'

'She came of her own accord,' said Fenwick. 'She has been here since you went out, not an hour ago.'

Millward placed his hand upon Fenwick's arm. 'Where is she?'

'My dear Millward,' answered Fenwick soothingly, 'she's safe enough. Pray, let me go on.'

The master sank back in his chair, and seemed indifferent to all that his friend now told him.

'I saw her resemblance to your picture the moment she came in,' said Fenwick, with a glance at the painting. 'It is like her; though nothing could be so beautiful as she is! She stole in here,' he added, 'knowing you were away. She came to look at your work. She has a passion for pictures; she has inherited your love of art.' And he related in a few words all that had happened during the master's absence on the river with old Gunning. But scarcely had he finished, when Millward hurried into the hall. There was a gleam of light on the staircase, and he hastened to the landing overhead. Here he stopped, and would have fallen had not Fenwick been at hand. A mist had gathered over the

master's eyes ; but through the mist he saw a figure coming slowly down the corridor towards him, with the lamp raised above her head.

Fenwick glanced from this figure into Millward's face ; and the far-off look which he had so often observed—the look that had suggested a spirit-model to the young artist's fancy—was a visionary look no longer.

'Is she not beautiful?' whispered Fenwick, with enthusiasm. 'Millward!—what a masterpiece you will paint!'

Millward stretched out his arms towards the figure. 'Bring my child to me,' said he, impatiently. 'I have done with art now.'

THE IDENTIFICATION OF CRIMINALS BY MEASUREMENT.

A VISIT TO M. BERTILLON.

MUCH has been said recently about 'Anthropometry,' but few people understand exactly either the system itself or its object. Let us explain the latter first. When the police lay their hands on a criminal or a suspect, it is obviously important to know his previous record, and whether or not he has been convicted before. Previous offenders make this as difficult as possible by giving false names and denying everything. Sometimes, no doubt, they are recognised ; but this can only happen in comparatively few cases, and is never a really trustworthy means of identification, for personal appearances change and the memory is treacherous. Many people have been hanged and imprisoned through mistakes in recognition. Photographs, again, are open to the same objection, and further, they accumulate in such enormous numbers that it is impossible to look through them. At the Préfecture de Police in Paris, one hundred thousand have been collected in ten years. Now, supposing a man is arrested for theft and gives a false name ; he may be an old offender, and his photograph together with particulars of former offences may lie there under another name in the pigeon-holes among all the rest. To look through them would take a staff of men eight days, and then it might be missed. But by M. Bertillon's system of measurement you can lay your hand on that particular photograph with absolute certainty in five minutes. Or, supposing that the man has not been up before, and that there is no photograph or record of him in the archives, you can establish this fact with equal certainty in the same short time. How it is done may be best explained by describing a recent visit to the Préfecture de Police.

The Measuring Room.—Escorted by an eminent French detective, we were shown up into the room where the measurements of prisoners are taken and the *fiches* are kept. The *fiche* is a card about eight inches by six inches, and on which are the prisoner's name, his measurements, any distinguishing marks about him, the particulars of his offences, &c.; and also his photograph in two positions—full and side face. The chief object of

the side-face is to get the shape of the ear, which of all features is the one most truthfully given by photography. These cards are disposed in small drawers, which stand on shelves, like those of a library, and are arranged in sections according to the measurements. Thus, one main section contains the cards of all individuals with a certain length of head. It is subdivided according to the breadth of head ; the subdivisions are further subdivided according to the length of the middle finger ; and so on. The measurements are written outside each drawer, so that they can be read at a glance. This will be further explained later on.

The Theory of the System.—Presently M. Bertillon, who had been informed of our visit, and kindly offered to expound his system in person, entered the room. He is still a young man, and the very type of an accomplished savant, speaking both English and German. The identification of criminals is carried out here under his direction by an able staff of assistants. The theory of the system is as follows : Certain bones can be measured in the living subject easily and with extreme accuracy. The dimensions vary in different persons within very considerable limits, and they do so in no definite ratio to each other. Consequently, if you take a sufficient number of them, you get an aggregate result which is true only of that particular individual measured and of no one else. During the eight years in which anthropometry has been used in Paris, it has been found that no two individuals have the same measurements throughout. The results obtained from a new subject in no case agree with any one of those previously taken, be they never so numerous. In fact, no two people are alike. Further, in the adult these dimensions are stable, changing little or not at all in the course of years. They therefore form a means of absolute identification at any time. The most important are the length of the head, its breadth, the length of the middle finger, that of the forearm, of the foot, and of the little finger. But to be of practical use the results must be classified. This is done by dividing each set into three groups—Small, Medium, Large. For instance, three sizes of the head lengthways are made thus : (1) Those less than 184 millimetres (= $7\frac{1}{2}$ inches). (2) Those between 184 millimetres and 189 millimetres (= $7\frac{1}{2}$ to $7\frac{1}{2}$ inches). (3) Those of 190 millimetres (= $7\frac{1}{2}$ inches) and above.

Suppose, now, you have a man measured, and want to see if he has been up before : you have to find his card among, say, ninety thousand. Take the length of his head : a glance shows that it is 187 millimetres, and consequently comes under group 2. You at once put aside groups 1 and 3, or sixty thousand out of the ninety thousand. Then take the breadth of the head in the same way ; this will reduce the remaining thirty thousand to ten thousand. And so on until you come down to a mere handful, when an examination of the minutest differences leads you with unerring certainty to the very one you are looking for. By the arrangement of the drawers in groups, already mentioned, the whole search is reduced to a matter of two minutes.

A Striking Illustration.—Having explained the

system, M. Bertillon proceeded to illustrate it. A young man, who had been arrested that morning for theft, was called up and measured then and there. The process is carried out by two men, one of whom applies the instruments and calls out the figures, which are entered on a card by the other, precisely as in a tailor's shop. The subject is barefooted and bareheaded. Ten measurements are taken in four minutes; they include those already mentioned, together with the height standing, the height sitting, the length of the arms extended, the length and breadth of the ear. This finished, M. Bertillon, card in hand, interrogated the prisoner:

'What is your name?'

'Albert Felix.'

'Have you ever been up before?'

'No, never.'

'Quite sure?'

'Perfectly sure,' with jaunty confidence.

As the young scoundrel was the leader of a band, this seemed highly improbable.

He was removed, and we proceeded to the search. Section after section of the drawers was rapidly eliminated by comparing the figures on them with those upon M. Felix's card. At last we came to a single drawer, and then down to two cards. If he was there at all, it must be one of these. A look at the first at once showed discrepancies of one or more millimetres under some of the headings, and as the bony measurements are accurate to a millimetre, it could not be this one. There remained one card. M. Bertillon took it up, hiding the photograph on it. All the figures corresponded exactly with those just taken of Felix. He was recalled, and again questioned. He repeated his former statements, but obviously with less confidence. M. Bertillon uncovered the photograph, and there the fellow was to the life, as he stood that moment before us. It was most startling. But the original of the photograph was called Alfred Louis Lemaire, and he had been in jail two years before. The card bore details of certain scars and marks on hand and body; they corresponded exactly with those on Felix. Our friend the detective edged up and watched the prisoner with professional delight. Again questioned, Felix stuck to his story; but his composure was gone; his eye was troubled, his lips trembled, and the muscles of his face twitched. The photograph was shown him. 'Who is that?'

'Not me, some one like me'—but very shakily.

'This is Alfred Louis Lemaire, and he was arrested, &c.'

The fellow was down in an instant, as limp as wet paper. 'Oui, c'est mon nom,' adding, 'I knew you would find it.'

The astonishing thing was that out of that great roomful of cards, not a single one corresponded, or anything like corresponded, with the measurements of the youth before us, except that particular one—his own. Mistake is impossible.

The system has been used in France for eight years, and found to be of infinite service. Russia and some other countries have adopted it; but its full value will not be apparent until it is employed everywhere, and especially in England and America—the two great refuges of criminals

—for of course measurements can be transmitted by telegraph, and thus identification of suspects established without trouble or delay—a thing impossible now.

THE MONTH:

SCIENCE AND ARTS.

MR GEORGE BADEN-POWELL, M.P., in a letter to the *Times*, dated May 13, states that on that day there had been consummated an event of far-reaching importance, in respect that mails from China and Japan had been delivered in London within twenty-five days of leaving Yokohama, and inclusive of three days' unnecessary delay at New York. 'The Shanghai letters,' says Mr Baden-Powell, 'have been actually thirty-two days and the Japan twenty-five days in transit; and, had there been an Atlantic steamer ready, they would have been delivered in twenty-nine and twenty-two days respectively. These mails were delayed three full days because, after arriving at Montreal, on Saturday, May 2, there was no fast steamer across the Atlantic from New York until Wednesday, May 6. The trip across the Pacific was most successfully accomplished by the new *Empress of India* in ten and a half days, although she encountered a cyclone; and the Canadian Pacific Railway Company ran the mail-train three thousand miles across the continent in ninety-one hours, a feat in long-distance railway travelling, I believe, quite unprecedented.' The effect of this marvellous shortening of the distance between the East and the West is of immense political and commercial importance. Japan is thus placed within three weeks of England, whereas it is distant five weeks by the next quickest—namely, the Suez—route.

Among the various schemes for cutting ship-canal which are now before the public is one for making an efficient waterway to connect the Forth and the Clyde. Most persons are aware that a Forth and Clyde Canal already exists, indeed, it is one of the oldest in the kingdom; but it is so small as to be only available for barges and vessels of limited draught. The original cost of this Canal was about half a million sterling, and for many years it paid a handsome dividend. To enlarge it so as to make it available for ocean-going ships and steamers would involve a cost of fourteen million, and this discovery has led to the consideration of alternative routes. There is no immediate prospect, however, of any decision being arrived at, and the promoters of the scheme would have some difficulty in showing how enough traffic could be relied upon to pay a moderate interest upon the enormous capital required for construction.

A novel form of lucifer-match has recently been patented, and it may to some extent be regarded as a safety-match; for the two elements necessary for ignition, and which usually are placed the one on the match, and the other on the box, are still kept separate. The chlorate

composition is at one end of the splint of wood, and the amorphous phosphorus at the other end, and before the match can be used it must be broken in half, so that the two prepared ends can be rubbed together.

Mr J. Henniker-Heaton, who has always been an energetic champion of postal reform, now suggests that the parcel-post system should be extended and cheapened so as to enable householders in our cities and large towns to obtain direct from the producers fresh butter, eggs, poultry, and garden produce. The rate which he proposes is one penny per pound with a minimum of threepence. There is little doubt that if such a system were established it would be of incalculable benefit to a number of thrifty householders. In London, for instance, it is impossible to purchase a fresh egg, even in the early summer when eggs are plentiful, under three-halfpence, although in many remote country places their market price at the time is a shilling a score, or even less. A similar disproportion between the retail price paid in our towns and that paid to the producer is found in all garden stuff. We trust that the Post-office authorities will see their way to giving Mr Heaton's proposal a fair trial.

The Naval Exhibition at Chelsea is perhaps the most entertaining as well as the most instructive of all the great shows which London has devised within the past few years. The relics and pictures alone would reward a visitor, even if his visit had cost a long day's journey. But perhaps the chief charm to be found here is in the contrast between what was and what is. One can explore a full-sized model of the old *Victory* as she was on that famous day 'in Trafalgar's bay,' and can then turn to the huge guns and other modern appliances in readiness for warfare at the present moment. It is difficult to realise that these guns, with their monster projectiles and huge charges of powder, are of such recent date, until one sees by their side the sixteen-pound bag of gunpowder which formed the maximum amount used for one discharge so lately as the Crimean War. The most cynical of mortals in passing through these wonderful galleries must own that there is some excuse for the boast about Britannia ruling the waves.

The destructive power exerted by a projectile from the one-hundred-and-ten-ton gun is shown by a full-sized diagram more than forty feet in length which traces the path of the huge conical bullet through various obstacles, the diagram professing to be a correct representation of an effect which actually occurred. The projectile itself is depicted embedded in a mass of brickwork into which it has penetrated three feet; but before finding itself at this end of its journey, it has made a hole first through a twenty-inch steel plate, then through eight inches of iron. It next tore its way through twenty feet of oak-timber, five feet of granite, and eleven feet of concrete, still having sufficient impetus to bury itself in the brickwork, as already described.

We know that the occupation of the fisherman is both a dangerous and uncertain one, and that many a toilsome cruise is undertaken with very meagre results. But sometimes the fisher is rewarded for his pains by extraordinary success, and he contrives to net so many fish that he

cannot find a market for them. Two such cases were lately recorded in the *Zoologist*. One was the capture of no fewer than twelve thousand gray mullet, the fish realising eighteen shillings per score, and the other a phenomenal catch of mackerel, forty-eight thousand fish, which sold for three hundred and sixty pounds. It is noteworthy that both these magnificent hauls were made off the Cornish coast; the first in that beautiful little bay near Land's End known as Sennen Cove; and the other a few miles south-west of the Lizard Point.

The pleasant and refreshing odour which is emitted by garden soil after a summer shower is one which most of us have learned to appreciate. This aromatic odour has lately formed the subject of scientific examination; and Dr Phipson has published the fact that twenty-five years ago he, too, endeavoured to solve the problem of tracing its origin. After a considerable number of experiments and examinations of soils of various kinds from different localities, Dr Phipson came to the conclusion that the odour is due to the presence of organic substances closely related to the essential oils of plants. He believes that the porous surfaces, in hot dry weather, absorb the fragrance emitted by thousands of flowers, and give it out again when rain penetrates the pores and displaces the various volatile substances imprisoned therein, which are only very sparingly soluble in water. In certain chalk rocks of Picardy the property described seemed to be so remarkable that Dr Phipson endeavoured by experiment to isolate the substance to which the odour was due, and by means of an aqueous solution of bromine he found that he was able to arrest it. Upon afterwards evaporating the bromine solution at a low temperature, he obtained a yellowish product soluble in alcohol, and having a strong odour of cedar-wood.

In a recent Report by the United States Consul at Barcelona, some interesting particulars are given concerning the cork industry. We first of all learn that the cork forests of Spain cover more than half a million hectares, the hectare being equal to about two and a half acres. The cork is better in localities where the trees are exposed to the north, and it is seldom found growing in chalky soils, preferring that in which felspar abounds. The plants are chiefly cultivated by sowing in ground somewhat manured, and they develop in soil having very little depth, the roots of the trees being frequently seen on the surface of the ground. The first growth of bark called 'virgin cork,' is not of any use for the manufacture of corks, but is devoted to other purposes. The secondary cork is the more valuable, and when removed from the tree is piled in heaps. It is then submitted to a boiling in water for about an hour, during which operation the tannin and other soluble matters are removed from it; it gains in thickness and elasticity, but loses from twelve to forty per cent. of its weight.

A correspondent of the *Illustrated Carpenter and Builder* gives a recipe for castings by means of a sawdust composition, which may be useful for decorative purposes when a light material is advantageous. The directions are as follows: Take equal parts of sawdust and common wheat-flour, and to every half-gallon of this mixture add half a cup of molasses; moisten this with a jelly-

paste made by combining equal parts of glue and rye-flour, and knead the whole into a stiff dough. The moulds should be treated with neat's-foot oil, and the composition well pressed into them and allowed to remain twenty-four hours in a dry place, after which the cast will easily separate. This should now be baked in a moderately hot oven, and when cold, painted or varnished. The result is said to be equal in effect to carved wood.

A new use for ramie fibre has been found in the manufacture of steam-pipes. The employment of a vegetable product for such a purpose would at first sight seem to be impossible; but the fibre has been rendered fit for the work by being previously subjected to hydraulic pressure. The material so treated is said to possess a tensile strength greater than that of steel.

A useful little appliance for artists has been invented by Mr E. P. Widell, of Portland, Oregon, and is called 'The Perfect Stretcher Key.' To understand its use and object, it is necessary to examine the back of a framed canvas prepared for oil-painting. At each corner of the woodwork, a mortise-hole is cut for the reception of a wedge of hard wood, and these wedges have to be tapped with a hammer to keep the canvas taut. With Mr Widell's arrangement, the wedges are dispensed with, and a little metal shoe which grasps the mitre of the frame on both sides takes their place. The invention is a distinct improvement on the older arrangement.

That our coinage is subject to a constant loss from abrasion in its transfer from hand to hand is a well-known fact, and we know, too, that the art of artificially removing some of the metal fraudulently has been practised, and is known as 'sweating the gold.' This is done by placing a number of sovereigns in a long bag and continually urging them from one end to the other, until by rubbing they part with an appreciable amount of gold-dust. It has been recently stated that careful experiments made at the United States Mint have disclosed the fact that every time one million dollars is handled five dollars' worth is lost by abrasion. For this experiment the gold was placed in bags containing each five thousand dollars, and it was found that the mere lifting to a truck of the two hundred bags making up the lump sum resulted in the loss stated. It is difficult to believe that the loss can be so great; but then it is equally difficult to understand how a coin in moving from pocket to pocket can in the course of a few years lose its superscription and half its original weight by mere wear and tear.

An American paper asserts that one of the best cures for the incrustation of boilers through the use of hard water is found in an Extract prepared from the leaves of the eucalyptus. This extract can be prepared in a very simple manner by boiling fifty pounds of the leaves in one thousand gallons of water. Three gallons of this Extract will keep a locomotive boiler free from scale for a trip of one hundred miles, leaving the boiler in such a condition that any deposit from the water can be readily washed out. The same solution will effectually soften the incrustation already formed in a boiler, and will cause it to soften and fall off in large pieces. The worst boiler can be cleaned in this manner with about two months' treatment.

It is said that cigar boxes as well as their con-

tents are now made the subject of adulteration. Spanish cedar-wood, which is the right material to use for cigar boxes, is somewhat scarce; and so West Virginia poplar, or other white wood, is employed instead after being dyed and treated with cedar extract to give it the proper colour and odour.

Since that very clean and pleasant vehicle called vaseline has come into use, doctors have largely employed it in the preparation of ointments, in place of the far less agreeable lard which was previously utilised for the same purpose. But the question has lately arisen whether absorption into the skin takes place in the same manner with two such different agents, and this inquiry has formed the subject of certain experiments upon animals, which are described in a French medical paper. By mixing lard with a given salt, having strongly-marked effects upon animals, and applying such a preparation to the shaved skin of a dog's head, it was found that the expected effects of the drug manifested themselves within a very short time after application. But when the same experiment was repeated with an ointment of similar strength, but made with vaseline as a vehicle in lieu of lard, the drug employed had no effect whatever. The authors of these experiments conclude that with vaseline ointments no absorption whatever takes place if the skin be intact.

It seems a curious fact that the clearer the water from a spring or well the more may its purity be suspected; but that is the inevitable conclusion which must be arrived at if certain experiments conducted by Major Powell of the U.S. Geological Survey can be relied upon. That gentleman tells us that these experiments were undertaken with a view to determine economic methods of precipitating the finely-divided clay contained in many waters supplied to cities. He found that there were many mineral substances which would cause precipitation if added in small quantities; but the one which produced the result by the most minute addition was sewage.

Professor Munroe, in a recently delivered lecture upon Gun-cotton, described that explosive as the safest to use, provided that it was correctly prepared and handled with intelligence. Gun-cotton becomes dangerous only when the materials composing it have not been thoroughly purified, or when the union between acid and cotton is incomplete. Proof was given that a workman can cut it with a saw or chisel, or can work it in a lathe while in a compressed state, with impunity. It was also stated that two thousand pounds of gun-cotton had been burned in a bonfire without explosion. Curious it is that letters stamped upon the blocks of compressed cotton are impressed upon an iron plate upon which the cotton may be exploded. If the marks on the block are in relief, their reproduction on the metal plate will be raised, and *vice versa*. Another curious circumstance is that if a delicate piece of lace or a leaf be placed between the gun-cotton and the metal, its delicate markings will be reproduced on the iron, although it will itself be annihilated by the explosion.

A critical examination of the weather which we experienced during the past winter formed the subject of a paper read before the Meteorological Society by Mr F. J. Brodie. First we have a reference to the prolonged frost which

lasted from the end of November to the end of January, in addition to which it was found that when the wind was not absolutely calm, it was sure to blow from a cold quarter. The barometric pressure for the whole winter was about a quarter of an inch above the average, while the rainfall over the greater part of the British Isles was less than half the normal amount. The number of foggy days with which Londoners were favoured was twice as many as are customary during the winter-time. It was further stated in this paper that almost every element in the British weather was influenced to an abnormal degree by the remarkable prevalence of high barometrical pressure.

POACHERS AND THEIR WAYS.

THE Poacher resembles Prince Charles Edward in being surrounded by far more generous sentiment and imaginative glamour than any personal merits of his own have fairly earned. The popular mind is fascinated by the picture of the hard-working villager burning with a love of sport which the law forbids him to gratify, stealing forth from his cottage at the dead of night, and hurrying away to the haunts of the hare and the pheasant, regardless of the perils of assault at the hands of night-watchers, and weeks of cruel imprisonment in the county jail at the hands of partial magistrates. Still more powerfully is public sympathy excited by the appeal of the man who when charged in court with poaching represents that he was out of work; he would scorn to steal, but his children were starving; and seeing a rabbit, he thought there was no harm in taking it.

But, alas, most of this sentiment is misplaced. There may be cases where men take to poaching from pure love of sport, or are driven to it by destitution; but in general, poaching is a sordid occupation; and the poacher either an idle loafer or a designing thief. No doubt, there are poachers who do not figure in courts upon other charges. But no one with a knowledge of rural life will dispute that the poacher is seldom blameless touching all other matters, seldom a creditable member of the village community, seldom a sober, hard-working, God-fearing peasant. He may be above ordinary theft; but he is one of the most constant customers at the village public-house; his children are in rags, and he is seldom six months in the same employment. Even this is a favourable specimen of the poacher. All poachers are not thieves; but in a country district most thieves are poachers; and the miscellaneous-goods merchant who receives poached game, and the cadger who takes it to market, are generally ready when required to be equally obliging in the disposal of stolen property.

The poaching fraternity admits of classification with some particularity. One broad line of division is between the rural poacher and the urban poacher. The former, again, are of two classes—the amateur and the professional. The

amateur or occasional poacher is a farm-labourer, a miner, or other manual worker, engaged in more or less regular employment; but occasionally at night, and not seldom on a Sunday, he turns a penny by doing a bit of poaching either on his own account or in company with one or two friends. The professional or constant poacher, on the other hand, is in no regular employment. Occasionally he does a little work as a day-labourer, and he is engaged in the fields at harvest-time. But for a great part of the year he can give no account of himself. When an orchard is robbed, he is not far away; and reynard sometimes gets credit, which the beast hardly deserves, for the disappearance of sundry fowls from the neighbouring farmyards. The dog, the ferret, the bag-net, the gate-net, the trap, the snare, and occasionally the gun, are the stock in trade of these rural poachers, whether of the amateur or the professional class. Ground-game are their chief quarry, though nothing comes amiss. They destroy much game, but they seldom make a great haul at one time. They lack the numbers, skill, and organisation to use drag-nets and capture coveys of partridges or grouse or a dozen hares at a single cast.

This last is one of the favourite instruments of the urban poacher, who is altogether a much more skilful and more deadly enemy of game than his rural brother. Urban poachers, like rural ones, are of two classes—amateur and professional. The former is a masterful poacher, and depends for his escape not upon skill in eluding game-watchers, but upon *vis major* if he is encountered. This class of poachers, hardly known in Scotland, abounds in England. Great gangs of men accustomed to rude manual toil issue from some large manufacturing or mining centre, swoop down upon a well-preserved district of country, and sweep all before them. Proprietors, keepers, and policemen, hardly apprised of their approach until they are upon them, are powerless to stay their progress. They 'clean up the country.' It is singular that, whilst a band of this kind if encountered with force will show the most determined fight and not stop even at murder, yet a crowd twenty times as numerous and composed of roughs of the same class, when gathered on a Sunday morning to witness a prize-fight, will melt like mist on the appearance of a single policeman. Nets, both drag-nets and gate-nets, dogs and sticks, are used by these poachers. Their incursion is most fatal to hares and rabbits, for they have not time, and make too much noise, to 'negotiate' winged game successfully.

The professional urban poacher is the most skilful, and perhaps the most dangerous of all. In the game season, half-a-dozen of them will settle down in some market-town near the centre of a well-preserved country. These poachers proceed with great deliberation. They prospect the country carefully, not grudging a longish railway journey for the purpose when that is necessary. Often one of them is the owner of a horse and cart; or, failing this, they initiate into their gang some local cadger who is therewith provided. The drag-net and the lantern are the favourite instruments of these poachers. They seldom use the gun or the snare, for these are too tedious and too dangerous. Winged game suffer severely

from their depredations. A covey of grouse or partridges are slumbering in security, when a slow dog with a lantern round its neck makes a point within a few yards of them. The poachers make a detour, and draw the net up towards the face of the dog, probably netting the whole covey in this way with a single cast. Pheasants, again, are seen against the sky roosting on the boughs of pines, and are quietly lifted down with the hand. It is to this class of poachers that the public are indebted for the grouse which appear in the poulterers' windows early in the forenoon of the 12th, and for hosts of immature pheasants on the 1st of October. The only way to rid a country district of such a gang, as magistrates know, is to break their bank. Small fines upon individuals are of no account, for the party have a common purse, or make one on such an emergency. That purse, however, is not often a very heavy one; and a few rigorous five pounds with expenses will generally break up the band and rid the district of their depredations.

The protection of the law was first accorded to game in order to preserve it for the sport of the sovereign and his friends. But for several centuries the right to kill game has been recognised as an incident of private property belonging exclusively to the owner of the soil. But for the protection thereby afforded to it, game would doubtless have been long ago extinct in this country, as is the case in those continental countries where no restrictions are placed upon the right of sport. There are many statutes dealing with the offence of poaching, some of them of very ancient date, as the old Scots Acts against killing hares in time of snow. But the Acts which in practice are generally appealed to are all of the present century. An important distinction is recognised by the law between day-poaching and night-poaching. The latter is a much more serious offence than the former, and on a third conviction the poacher is liable to penal servitude. It has been explained by the courts that the Night-Poaching Act is a measure not primarily for the preservation of game, but for the protection of the public peace and of the lives and limbs of the lieges. Experience has shown that night-poaching is often attended by scenes of shocking violence, and not unfrequently leads to murder. The law accordingly deals with this offence with a stern hand. Under the Night-Poaching Acts of 1828 and 1844, night-poachers, whether found upon the land or upon the roads during the night—namely, from one hour after sunset to one hour before sunrise—may be seized by officers, or by the proprietor or his servants, and are liable to three months for the first offence, six for the second, and penal servitude for the third. Where weapons are used, or where three or more are armed with weapons, the penalties are much more severe.

Under the Day-Poaching Acts, 1831 for England, and 1832 for Scotland, the day-poacher is much more leniently dealt with than his nocturnal brother. If he give his name and address, he cannot be apprehended unless there be good grounds to believe these to be fictitious; and the penalty is only five pounds. Where five or more go out together, or where violence is used, the penalties are more severe.

These statutes were not found sufficient to check poaching, for, once the poachers got off the land unobserved, there was no means of apprehending them. It often happened that a policeman met men returning to town in the early dawn with a cart or bags which he was morally certain contained game taken by poaching; but he had not seen the men on any land, and he had no warrant to apprehend them, and so they could laugh in his face. To meet this difficulty, the Poaching Prevention Act of 1862 was passed, under which constables are empowered without a warrant to seize and search any persons, though found on the public highway, if there be reason to suspect them of carrying poached game or poaching instruments.

The game laws are not popular; but those who condemn them are seldom as severe in their logic as in their censure. Very few go so far as to profess a desire to see game extirpated in Britain. But this would certainly follow if all protection were withdrawn. Nor can it be said that the present protection is too stringent, for, in spite of it all, poaching still abounds. There is more reason in the argument that the exceptional character of the legislation is objectionable, and tends to foster the opinion that poaching is in a different category from all other criminal offences, and involves no moral turpitude. It has been suggested with some plausibility that the whole of the Acts against poaching should be swept away, and a simple enactment substituted providing that game is the property of the man on whose land it is found, and that the taking of it without his permission is theft. Such a law would have been harsh and oppressive so long as there were many wild unenclosed tracts throughout the country where game roamed at pleasure dependent upon no man's care. But now in this country, with its dense population, its advanced cultivation, and its numberless enclosures, game is an industrial rather than a natural product of the soil, and in any case is as dependent for its existence as are the flowers of his garden upon the care and protection of the owner or occupier of the soil.

TEARLESS GRIEF.

At last it is the peaceful night, and I,
Weary and fretted with the noisy fray
Of Life's incessant tumult, can allay
My spirit's thirst for peace. The moonlit sky
And shadow-circled Earth are still. No cry
Of passion-burdened hearts disturbs the gray
Impressive calm; and though the late gone day
Left me a Life's regret, my eyes are dry.

For tears are nought but Summer's healthful rain,
That, falling from storm-clouds, leaves far above
A clearer blue. I bear a deeper pain
Than can find ease in weeping; so, dear love,
Forgive my tearless grief. Perhaps you guess
My heart's unmitigated bitterness.

THE ART OF HAPPINESS.

BY MRS LYNN LINTON.

SOME of us in one form—skating, let us say, on rough ice ; some in another—running uphill, vainly emulating the goats ; and others dashing headlong down the slopes leading to the fathomless abyss below—but all in our own special way pursue that mocking shape we call Happiness—that iridescent phantom hovering before our eyes, close to us, so close that we can almost touch it, and yet keeping just beyond our grasp. We pursue, and for the most part the more vigorous our chase the farther we are from the capture. With happiness, as with sleep, the consciousness of effort destroys its own success. It must come unbidden, stealing softly through the dim pathways of the night, and holding us securely possessed before we know that it is there. All our tumultuous efforts to secure the one or grasp the other fail ignominiously, for both are states, not things, and these states are not to be captured by force, like fortresses or three-deckers. And yet the acquirement of happiness is an art ; and an art, perfectness in which is not gained by every one alike.

Some put their faith in Pleasure, and dance along the highway hand in hand with that handsome *Mænad* whom they call Happiness, at least for the time. Now the two, Pleasure and Happiness, are foster-sisters, but not twins—not identical—like and yet unlike. At first sight and while we are young, perhaps they are indistinguishable the one from the other, but after closer scrutiny how different they are ! The eyes of Happiness are soft and bright, and the eyes of Pleasure are hard and glittering ; the smile of the one is sweet and tender, and that of the other is often cruel and maybe vacant ; the hands of Happiness are cool, and when not purposefully employed are still and quiet, while the hands of Pleasure are burning, dry, and restless. Happiness does not grow old and wrinkled as Pleasure does. Happiness does not live on stimulants and intoxicants, and Pleasure does. Happiness goes afield with

Love and Work, and the companions of Pleasure are Dissipation and Idleness. No ; the two are emphatically not the same ; but sometimes, as has been said, Pleasure masks herself to look like Happiness, and the purblind call them twins, and the hopelessly blind absolutely one and indivisible. Only when the mask wears thin by time, showing the true face underneath, or when it falls off altogether in the day of sickness or the hour of death, only then do the poor self-made dupes find out their mistake—and then it is too late !

Others make Fame and professional Success their synonyms with happiness, and think if they can get either of these they are safe. But they, too, find they have caught the shadow and lost the substance, and that their frantic rush uphill has landed them midway and not at the top at all. Take Fame, the most glittering of all those simulacra of happiness which hover before us, like foam flung off from the mirage—which is not the living lake—what real happiness does it give ? The man set on a pedestal by those who do not know him, understands to the faintest line the falsehood of his presentation, and how it is not he himself, but only something made into a rough-hewn likeness of himself, to which the people intone their hymns of praise and shout aloud their huzzas. Crowned and sceptred as a king, he alone knows the shape of those pointed ears, vibrating under the gold and gems. He, the glorious statue of burnished silver, hides beneath his shining robe the feet of clay which are the measure of his worth. When his worshippers bend before him as the sheaves of corn in Joseph's dream, he may for a moment feel that thrill of pride which makes a man his own God and seems to give him his charter of superiority. But it passes. He is himself ; not the finer phantasm he is assumed to be. A thousand variously-coloured lines modify the one uniform tint which is all that outsiders see. He knows all about these subtle modifications, either for good or ill ; and the world does not. When he is exalted beyond his merits his own conscience abases

him; when he is reviled beyond his deserving his consciousness of purity of intention supports him. For as little as indiscriminating praise gives him happiness so little does undeserved blame give him true misery. But surely to a man who has any real grit in him none of all this blind adulation brings that loveliness of mental condition we call happiness. To be our own God is but a poor kind of religion; and when we feel superior to the majority, all we can say to ourselves is—What a poor lot that majority must be! From all of which it comes about that the proud man, the vain man, the adulated man, even the successful man, is not necessarily the happy man. He is elated truly; he puffs out his chest; holds his head high; stands with feet far apart, enlarging his base the better to bear his heavy weight of supremacy; but that sweet-voiced, dewy-eyed spirit does not stand on his right hand. The winged Victory, Nike, the serving-maid of the gods may; but Nike was not Happiness.

Nor is excitement the *alter ego* of this dear spirit. Excitement is not real happiness, no more than was that handsome Maenad, Pleasure. That restless activity which must be always doing something and going somewhere, confuses thought and destroys the very beginnings of stability, as the rushing north-easter nips off the buds of growing plants. It destroys, too, regret and repining. So far we must confess. No one who is always in a whirlwind can mope and fret any more than he can think or foresee. Those busy bustling philanthropists, for example, who turn the world upside down that they may send out blankets to Central Africa and churns to the poor dear Hindu dairymaids, these know no more what they are doing, and see no more where they are going, than so many blind puppies crawling to the top of the cellar stairs. Perhaps you will say they are happy in their ignorance. No, they are undisturbed in their self-consciousness; which is another thing altogether. If they and all their breezy restless kind are to be called happy, it is as if you should say that an oratorio and a *charivari* are the same things. Both are noises made by instruments; but the one is a noble melody and the other a hideous discord; the one has art, science, knowledge, in its method, with grandeur and beauty as the result, and the other is—a *charivari*. So this tumultuous excitement, this palpitating unrest, this noisy violence of energy and avoidance of dullness, may be the grave of many mopings, but it is none the more happiness—and it is not even permanent.

Are we happy when we go off the line and defy the conventions of that society wherever we have to live? Doubtful. Even love, elsewhere so divine, does not give us the thing we want when it is taken beyond the safe borders and cherished in the salt desert of the Uncovenanted. For figs we gather thistles; and for the juice of grapes we brew our bitter portion from the purges and the sage bushes, which are the only flowers our arid garden bears. Besides, this kind of thing is always companioned with cruelty. Some one has to bear the scourge of blame, and some one is robbed of a good. And no real happiness exists side by side with any form of selfishness. The undisturbed placidity of selfish enjoyment is not happiness. Satisfied vanity, fulfilled desires, the want of disturbing sym-

pathies, the purring gratification of a warm sleek well-fed cat—all this is not happiness; and those who are the most given up to selfishness know the difference.

Where, then, is the art? What is its name, its nature, its literature, its craft? How can we learn it? How, when learnt, can we practise and ensure it? If in the power of one to acquire, why may we not all be past masters in the art? and why should the heavens re-echo with the cries of the drowning when each living soul has a plank whereon to sit securely and weather out the storm? In a world where treachery, death, disease, and loss are thick as autumn leaves in Vallombrosa, how can we be happy? For is not man born to sorrow as the sparks fly upward, and are not happiness and sorrow foes to the death? Too true! And yet even in the worst of our chances we can save something from the wreck, and that divine Art of Happiness is never wholly lost. In that dignity of patience under the inevitable, which, whether we call it resignation or philosophy, has always the same power to still those frantic cries, to quiet those futile reproaches, we find the first beginnings of the art, even when apparently we have nothing before us but despair. If the disaster is reparable, we experience some kind of happiness in the brave struggle to mend it. Certainly, there will be none in that cowardice, that supineness, which folds the hands and lets circumstance overcome endeavour. In patience, then, under what we cannot repair nor restore—in energy of endeavour when this can mend matters—the first tender seedlings of happiness, that true Tree of Life, spring up, even under the cold shadow of sorrow, loss, and stress. In unselfishness and love, in activity, and content with what we have—making the best of things—we find the perfected growth.

Those who live for Self live in a barren round—like the Egyptian snake circle, ending where they begin. They get no farther on their way, and they enclose no fertile ground as they go. How should they? What progress—what life is there in selfishness? As much as there is in brooding over a chalk egg and watering a dead stick. But those who have the wisdom to be content with what they have and cannot better, and those who have the generosity to sympathise with others, seize the life of life and compel it to their service. There is no happiness, properly so called, in the indifference of selfishness. Is the dead dull granite boulder happy? The lost child weeps, and the weary wayfarer faints beneath its overshadowing mass, and the granite boulder is unmoved. Is that greater happiness than the good Samaritan knew when he poured oil and wine into the wounded man's gaping sores, and by the fellow-suffering of sympathy helped him out of his strait? What joy equals that of giving joy and bringing solace to the afflicted? Half the exquisite delight of love is in this divine power of giving; and those who feel only the pleasure of receiving, love themselves, truly, but no one else. In fruitful work, too, if not in the coarser wilder excitements of pleasure and general unrest, we find these same seedlings grown now to well-sized saplings. So in independence of thought and action, while keeping clear of that queer country of eccentricity where every one is held to

be bad or stupid who does not live up to that special lot of blue china. So long as we are the slaves of another we cannot be happy. We can give reverence and obedience out of the fullness of our own souls, but that is not the same thing as the slavery of submission—the craven abjectness of fear—the self-dishonouring concordance of snobbery. No man can be happy who has a thousand masters of whom he is afraid—one for one season and the other for another. A soul that burns to say its faithful word in the cause of truth and justice, and that dares not for fear of offending some one in the back parlour—some one in the street—what pain! what humiliation! Can anything be worse?

Again, happiness can exist only with a good conscience. If the past be peopled with spectres of sin and the shapes of shameful deeds hover on the horizon, ever ready to close in upon the miserable sinner, happiness is as far off as sleep to the hag-ridden, restlessly tossing in his bed. But the stainless past ensures the peaceful present, and only then do we meet the day as our friend, feeling glad to be alive, and to have yet our chances and our hopes. To err is human, as we all know; but we err in stages and degrees; and though there do not exist the men or women who could proclaim from the house-top all they have ever done or said, still we are not all beset by those shapes which destroy peace, security, and happiness in one. So, then, in the good old-fashioned virtues, in fruitful activities, in respect for duty and obedience to its laws, in content, in sympathy and love for others, we must all find our happiness—these being in truth the elements of the art.

DUMARESQ'S DAUGHTER.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,'
'THIS MORTAL COIL,' ETC.

CHAPTER XXX.—PSYCHE IN AFRICA.

FOR some time after her arrival in Algiers, Psyche seemed to improve a little on the air of Africa. In the first flush of the new Oriental life, her eyes grew stronger for a while, as Dr Godichau had confidently predicted. There was always something fresh to look at that roused for the moment her passing attention. And to have her attention roused was exactly what Psyche now most needed. Even a broken-hearted girl can't be placed for the first time in her life in the midst of that wonderful phantasmagoria of Eastern costume and Eastern manners without being momentarily excited and interested. Psyche wished to see, and she saw accordingly.

The three Vanrenens and Geraldine Maitland accompanied her everywhere on her first walks among those enchanted African hill-sides. From the *pension* itself, to be sure, the sea was invisible; but a few hundred yards along the cactus-bordered lane that leads to Ali Cherif's villa brought them full in sight of that exquisite bay, and the high snow-capped summits of the glistening Djurjuras. With a little cry of surprise, the first time she went there, Psyche stopped for a moment and gazed entranced at the endless variety of that beautiful panorama. Straight below them, on its three rounded peaks, the town of Algiers, with its dazzling white houses, basked and glowed in the full African sunlight. The whole mass

rose up sheer like a series of steps from the water's edge to the mouldering citadel of the Deys that crowns the hill-top. In the antique Arab quarter, each house stood square and flat as a die, white-washed without, though doubtless dirty enough within; and clustering as they did in tiers one above another with their flat roofs, on the steep slope, nothing could be quaint or more artistic in effect than their general outline. All round, the suburbs spread over the ravine-cut hills, each French château, or Moorish villa, or Arab palace, gleaming apart, surrounded by its own green stretch of olive orchard or pine-grove.

To Psyche, all these southern sights were new and surprising. She had never set her foot before beyond the four sea-walls of Britain. The tall cypress hedges, the waving date-palms, the scrubby vineyards, the canes and aloes, which to most of us only recall that familiar Riviera, were novelty itself to the untravelled Petherton girl. The glowing white houses with their green tiles, the mosques and minarets, the domes and cupolas, the arcades and the Arabs, the brown-legged boys and veiled women on the road below, all showed her at once she was indeed in Islam. She sighed profoundly. So this was Africa! This was the land where her painter lay buried.

But it was beautiful, too, undeniably beautiful. She felt as she gazed something of that calm subdued pleasure one might naturally feel in some sweet garden cemetery where one's loved ones slept among bright clustered flowers. The first poignant anguish of disappointment and loss was over now, and a tender regret had grown up in its place which was almost pleasant. Psyche's heart was fading so gently away that she could look with a certain half-tearful joy at that exquisite view over the sweeping blue bay and the clambering white town that ramped and climbed in successive steps from the purple harbour to the green summit of the Sahel.

Gradually, however, during those first few days in Africa, it began to dawn upon Psyche that the Vanrenens were wealthy—enormously wealthy. And gradually, too, as the same idea came home to Haviland Dumaresq's mind, Psyche noticed with a certain little thrill of horror that her father began to make excuses and apologies for Cyrus Vanrenen's brusque American manner. 'The young man's really a good-hearted young fellow,' he said more than once to Psyche, 'though of course uncultured. But I daresay he might be brought into shape after a time. Young men are plastic: remarkably plastic.'

One of those days, as Psyche and Geraldine returned from a country walk, they found Haviland Dumaresq, in his gray morning suit and his rough woollen cap, engaged in examining the Arab wares which a couple of tawny pedlars in turban and burnous had unrolled from their pack and spread on the ground under the open piazza.

The scene was indeed a curiously picturesque one. On one side stood the great European philosopher, tall and erect, with his pointed gray beard and his luminous eyes, the furthest artistic development, as it were, of the Western idea in costume and humanity. On the other hand, lay stretched the two lithe and graceful Orientals, in their flowing robes and not unbecoming dirt, with their oval faces and big melancholy eyes, reclined at their ease on their own Persian rugs,

flung down for sale on the tiled floor of the piazza. All round stood piled in picturesque confusion the quaint bric-à-brac which forms the universal stock-in-trade of all these lazy and romantic old-world packmen. Coarse hand-made pots of red and yellow earthenware; tortoiseshell guitars and goat-skin tambourines; inlaid brass trays, with Arabic inscriptions in silver lettering; naive jewellery, set thick with big beads of bright red coral and lumps of lapis lazuli; swords and daggers of antique make; embroideries rich with silver and gold; pierced brazen lamps stolen from desecrated Tunisian mosques; haiks and burnouses of Tlemçen workmanship. All lay tumbled on the ground in one great glittering mass, and Haviland Dumaresq, with attentive eyes, stood propped against the parapet of the arcaded balustrade and glanced at them hard in philosophic reverie.

'Hello! Pedlars again!' Cyrus Vanrenen exclaimed with boyish glee as he opened the door and came face to face with them. 'They've set up store in the front piazza!—Been making any purchases to-day, Mr Dumaresq? The one-eyed calender there' (for the younger of the Arabs had lost an eye) 'he knows how to charge; he's a rare old rascal.—How much do you want for the ostrich egg, mister? Combien l'œuf, mon ami—comprenez-vous—combien?'

He took the thing up in his hands as he spoke. It was a half-egg richly set as a cup in Kabyle metal-work, and suspended from three graceful silver chains to hang from the ceiling. 'Fifty francs,' the Arab answered in French, showing all his teeth in the regular melancholy Arab smile.

'Here you are, then,' Cyrus said, taking out his purse. 'Tenez; vous voici.—May I offer it to you for a little souvenir, Miss Dumaresq? It'd look real pretty hung down from the gas in the centre of a parlour.'

'Oh, Mr Vanrenen,' Geraldine cried, aghast; 'you oughtn't to pay what they ask, offhand, you know. You'll spoil the market. You should offer them half. You ought to *marchander* for everything with the Arabs. If you'd *marchandé* for that, you'd have got it easily for at least thirty.'

'I guess so,' Cyrus answered with a careless air, handing the egg over to Psyche, who took it half irresolutely. 'But time's money, you see, across our way: a fact which these gentlemen in the bare legs don't seem to catch on at; and twenty francs ain't worth standing and bargaining about in the sun for half an hour.'

'Oh, thank you ever so much,' Psyche said, admiring it. 'Do you really mean I'm to take it, Mr Vanrenen? How very kind of you!—Isn't it lovely, Papa? It'd look just sweet hung up in the recess over the sideboard at Petherton.'

'It is pretty,' her father said, taking it from her with evident embarrassment. 'Extremely pretty in its own curious barbaric way—though, of course, it exhibits the usual extravagant barbaric tendency towards reckless profusion of ornament over the entire field. In the best decorative art, the ornament, instead of being lavished on all parts alike, is concentrated on important constructive features.'

'Oh, you look here, Cyrus,' Corona cried, gazing up at the wall, where the Arabs had

hung an exquisite embroidered satin *portière*. 'Ain't that just lovely? Ain't the colours sweet? Did you ever see anything prettier in your life than that now?'

'And wouldn't it look elegant,' Sirena continued in the same breath, 'hung up in the archway between the drawing-room and the anteroom at Cincinnati?'

Cyrus put his head on one side and eyed it critically. It was indeed a charming piece of old Oriental needlework, torn from the spoils of some far inland mosque. The ground was of dainty old-gold satin; and the embroidery, rich in many tints of silk, was thoroughly Saracenic in type and colouring.

'Combien?' Cyrus asked laconically after a brief pause. His stock of French was remarkable for its scantiness; but he beat it out thin for active service, and made each word do the utmost duty of which it was capable.

'Douze cent francs,' the Arab merchant answered, holding up the fingers of both hands, and then two over, as an aid to comprehension.

'Je vous donne six cent,' Cyrus observed, tentatively, well warned by Geraldine's superior wisdom.

'C'est à vous, Monsieur. Prenez-le,' the Arab answered as he bowed and shrugged his shoulders with perfect coolness; and Cyrus, pulling out the twenty-four pounds in good French gold, handed it over at once, and seized the *portière*.

'That's for you, Sirena,' he said, laying the thing lightly across his eldest sister's arm. 'You can hang it in the archway when we go back to Amurrica.'

'You're real good, Cyrus,' Sirena answered, kissing him fraternally before the scandalised faces of those disconcerted Arabs. (The conduct of these Frank women is really too abandoned!)

'That's just like Cyrus!' Corona said, laughing. 'He don't know how to get rid of his dollars fast enough. If he went into the market and took a fancy to a camel, I guess he'd purchase it to take across to Amurrica. Yes, sir; he's a first-rate hand at spending money, Cyrus is. But then, you see, he's a first-rate hand, come to think, at making it.'

'It's easier to make a dollar in Amurrica than a shilling in England,' Cyrus answered apologetically; 'and it's easier to spend it than to spend sixpence. That's what I always say when I come across this side. A man's got to work pretty hard at his spending, hereabouts, or he finds the money accumulate inconveniently in his waistcoat pocket.'

'I've never been inconvenienced in that way myself,' Dumaresq murmured with grim irony.

'No, sir, I reckon you haven't,' Cyrus answered with refreshing American frankness. 'But then you've never put your brains into the business, or you'd have struck it rich. You've been otherwise occupied. You've made what's better than money—fame, reputation, an honoured name in the world's history. Why, I'd rather have written the *Encyclopædic Philosophy* any day, Mr Dumaresq, than boss the biggest and most successful pork concern in all Cincinnati!'

Haviland Dumaresq shrank into his shoes. Great heavens, what an ideal of earthly success! And yet—the man was evidently rich. Besides, Americans have the plasticity of youth. Young

communities resemble in some respects young individuals. As is the mass, so are the units. There's no knowing what you may not make out of an American, if you catch him young, take him in hand firmly, and expose him consistently for two or three years to the mellowing influence of a fresh environment. Americans have plenty of undeveloped tact: it needs but intercourse with more refined societies to bring that latent faculty visibly to the surface.

BEAM-TRAWLING.

ONE of the most interesting industries born of the enterprise of recent years is undoubtedly that which reaps the harvest of the sea by means of Beam-trawling. This industry has made wonderful progress in Aberdeen during the past eight years. Then, one small vessel, named the *Toiler*, was purchased by a few merchants and was started to trawl from that port. Its efforts were crowned with success; and to-day over sixty first-rate trawlers bring fish from the best fishing-grounds in the North Sea.

A large quantity of the fish so caught is daily despatched per rail to various parts of the kingdom, and brings a high price in the metropolitan and other southern markets. Especially is this the case with flat-fish, such as turbot, brill, lemon soles, craig flukes (known as whitches), and plaice, which are the especial product of the trawl.

In early days the trawling system met with much opposition; and even yet, in spite of the rapid progress of the trawling industry, many retain an unaccountable prejudice against trawled fish. A few words on the subject may help to remove some of these objections.

To begin with the boats. A steam trawler—to take an example from the most recently-built vessels—is a steel boat, of about one hundred and twenty tons gross register. The dimensions of a vessel of that size would be ninety-five feet in length, twenty feet in breadth, and ten and a half feet in depth. The engine-room would be fitted with a compound condensing engine of fifty horse-power nominal, and would have telegraphic communication with the bridge. There would be ample and comfortable cabin accommodation, cooking-range, and other conveniences. It would also have a fish-room, divided into a number of compartments, known as 'ponds.'

But the great feature of trawl-boats is the 'gear,' as the net and its appendages are called. The newest boats contain two sets of gear, so that if one set meets with an accident, the other is ready for use. The apparatus consists (1) of a huge beam of oak about fifty-four feet in length, supported at either end by upright iron frames called 'trawl-heads' or 'irons'; (2) the net, the upper part of its mouth attached to the beam, the lower part, which drags on the bottom and gathers in the fish, being fastened to the 'ground-rope,' a strong rope over one hundred feet long; and (3) a steel rope, one hundred and fifty feet long,

termed 'the bridles,' attached to each of the trawl-heads, and uniting in the form of a bridle, are fastened to the 'warp,' by which the whole is towed.

The trawl-heads are something like a pear in shape, and move along the bottom of the sea just like a sledge. The beam is attached to the upper side of the trawl-heads, and is thus raised four and a half feet from the ground. It has been alleged that this heavy beam destroys both fish and spawn—that, in fact, it kills more fish than it catches; but it will be seen that this is impossible, seeing it never touches the ground. As the gear moves on after the boat, the ground-rope stirs up the fish, and the current of water raising the 'square' of the net, they swim into the single part or belly. Should they try to escape, and go up into the pockets, the flapper acts as a trap-door and keeps them fast. The best water for trawling in is from twenty to thirty fathoms deep, with a bottom of mud or sand. The gear is secured to the boat by the 'warp,' composed of two hundred fathoms Manila rope and one hundred and eighty fathoms wire-rope.

The trawl-nets differ in size; but one belonging to such a boat as we have described would be about ninety feet in length, with a mesh of two and a half inches square. This net is like a huge jelly-bag with part of the front cut out. It is made of tarred Manila twine.

In addition to the 'square' or single part, there are the 'batings,' which run down to the end of the square, diminishing in size as it goes, to make what may be described as the pointed end of the jelly-bag; the 'belly,' which is made of heavier twine; and the 'wings,' which run down each side, and connect the belly with the top.

To the top of the square are attached the 'beam' and 'trawl heads,' and from the ends of the top of the square, round all the front of the lower part, is the ground-rope. At the extreme point is the 'cod-end.' The inside is divided into compartments called 'pockets,' covered with 'flappers.'

Having got his gear all properly in order, the skipper lays in a stock of coals, ice, water, and provisions, sufficient for several days; and, with his crew of seven or eight men, steams straight for one or other of the fishing-grounds within a reasonable distance, choosing from his chart the one most likely to repay his efforts. It is a fine sight to see the brave little crafts steaming out of the harbour, the skipper at his post on the bridge, the crew—with the exception of the engineers—overhauling the nets, or waving kindly farewells to friends on the pier.

On arriving at the fishing-ground, preparations are made for 'shooting away the gear.' The net is tossed overboard, the beam and trawl heads follow; and as the boat, which had stopped for a little, moves slowly onward, some one hundred and fifty or one hundred and eighty fathoms of rope are unwound by the steam-winch, in order to allow the trawl freedom of action.

The usual time for allowing the gear to remain down is four hours. Should the trawl get 'fast,' however, as not unfrequently happens when trawling over a rocky bottom, it is hauled up at once.

While the net is down, the vessel moves round in a circle at a moderate rate of speed. During

this period, the crew have their time pretty much at their own disposal; but they must hold themselves in readiness for duty at any hour of the day or night should the gear get damaged. For this reason, they seldom undress, but pull off their sea-boots and 'turn in' for some hours' sleep, often to have to start up after a few minutes. This uncertainty is one of the greatest hardships of trawling life, especially in winter, which season is the trawler's harvest.

At the expiration of four hours, the cry 'Up trawl!' brings the whole crew on deck, to assist in the important work of heaving up the gear. The men don their oilskins; the steam is put on to the winch, and the trawl-rope is slowly wound up. Then the bridles—which are of a V-shape, one end of each meeting at the end of the trawl-rope or warp, to which they are attached, and the other ends being fastened to each end of the beam—make their appearance.

The beam and trawl-heads next come to the edge of the boat, to which they are securely fastened. The single part of the net is then hauled up by hand; and a final effort of the winch and derrick brings the cod-end containing the fish high above the deck, looking more like a full jelly-bag than ever. The rope at the bottom is untied, and down the fish fall on the deck, all alive, and in splendid condition. The gear is then 'shot away,' and all hands are presently busily employed in storing the fish. The turbot and other large fish are bled by cutting the main artery, and the haddocks, &c., gutted. Those requiring cleansing from sand or slime are washed in a trough of sea-water, and the whole 'shot' is then handed down to the fish-room, and placed in the ponds between layers of ice, covered with deals, there to remain till the market is reached.

By this mode of treatment the outer air is completely excluded, and the cold air from the ice keeps the fish cool, fresh, and firm. Besides the edible fish, various curios are brought up by the trawl, such as jelly-fish, cuttle-fish, star-fish, sea-hedgehogs, sea-snails, and rare and beautiful seaweed. The trawlers also bring up large quantities of dog-fish, and monks or fishing-frogs, which devour enormous quantities of spawn and fish. These monsters are seldom caught by the lines. By catching so many tons of these creatures, the trawlers render good service to line and herring fishermen.

The theory, once so popular, that trawling destroyed the spawn of fish is now quite exploded. Special inquiries were made; and the result was that, according to the scientists engaged in these investigations, it was found that most spawn floats and vivifies near the surface. Moreover, the supposed spawn brought up by the trawl was proved to be nothing but gelatinous inhabitants of the sea.

After the marketable fish are disposed of, the refuse is shovelled overboard, and the decks are then scrubbed with an abundance of sea-water, pumped up by the donkey-engine. This process of shooting away the gear, heaving it up again at the hour's end, or sooner if necessary, storing the fish, scrubbing the decks, and of course mending the nets when they get torn, which constitutes the routine of trawling life at sea, is repeated till the skipper considers he has enough of fish to clear the ship's expenses and remun-

erate himself and his crew for their arduous labour. When the last haul is brought on board, the order, 'Full speed ahead,' is given; and the trim craft is soon dashing through the waves 'homeward bound.'

On reaching the Fish-market wharf, the fish are discharged in baskets, swung on shore by the derrick, and laid in rows, or placed in boxes on the concrete floor of the market, to await the daily sales. It ought to be noted that the boats invariably arrive in the morning to catch these sales, which last from eight to ten or eleven, according to the supply of fish.

The ringing of a bell announces that a sale is about to commence. Fishermen and women, curers, clerks, and others interested, gather round the salesman, who, with wonderful despatch, disposes of hundredweight after hundredweight to the wholesale buyers. Large quantities of the best are packed in ice and sent off at once by rail; and the rest are carted to the fish-shops, or retailed in the streets by the hawkers. When they are all disposed of, a deluge of water, turned on by a hose, renders the floor clean and sweet for the following day's sales.

The trawlers meanwhile have moved off to the loading jetty, to lay in stores before again proceeding to sea.

A word as to their food must close our sketch. Each boat carries a first-rate cook, and the daily bill of fare is substantial and varied. That it should be so is a necessity of trawling life. The work is arduous, and the exposure to all sorts of weather great. Strict temperance is the rule on all the Aberdeen boats—in fact, the use of spirituous liquors is prohibited by the owners. Coffee or tea is supplied at the end of every four hours, accompanied by fried fish or some such solid; and dinner, as a rule, consists of three courses—soup, meat, and pudding or tart.

Trawl fishers are a brave, kindly class of men, who toil hard, year in, year out, to win daily bread for themselves, their wives and families, and also to supply cheap and wholesome food for the people. Their pleasures are few, for life at sea is monotonous, especially in their line of life; but their spirits are light amid all their hardships, and they are always ready to give a hearty welcome on board their boats to those who take an interest in their work and desire to penetrate its mysteries. Trawlers, as has been already hinted, are paid by results.

On some of the boats, after the ship's expenses are cleared, half of the profits are divided amongst the crew, the skipper of course and the first-fisherman getting the largest share, and so on downwards. A year's pay among a crew of eight men would amount to something like a thousand a year. If a boat brings in fish to the value of from three to four thousand a year, it is considered to be doing well. Of course it may exceed this figure by a large sum. The skipper is often a shareholder in his own or other boats, which of course increases his income proportionately.

Two kinds of ice are used in the fish-trade, Norwegian and manufactured. A company for the preparation of the latter already exists in Aberdeen, and another is being formed.

It may be interesting to state that, according to statistics obtained from the Fishery Office,

the amount of trawl-fish brought to Aberdeen for the year ending 31st December 1890 was 172,175 hundredweight, the value of which was £135,047.

THE ROMANCE OF A SUMMER.

BY LYDIA M. WOOD.

IN FOUR CHAPTERS.—CHAP. I.

THE London season was over; the last At Homes and dances were quickly becoming things of the past; and the fashionable world was preparing for its usual flight to 'fresh fields and pastures new.' Already the ranks of youth, wealth, and beauty, which had thronged the Park during the hot June days, had thinned considerably; blinds were drawn down in a good many mansions; and a general air of deserted loneliness pervaded the streets as you turned west. In short, Town—that paradise of the wealthy and high-born—was getting positively unbearable. So at least it appeared to Humphrey Standish, as he gazed idly out of the window of his mother's drawing-room in Wilton Street, looking and feeling decidedly bored by the general uninterestingness of everything. He was a tall handsome fellow, of about seven or eight and twenty, possessed of an ordinary supply of brains, and enough money to enable him to live very comfortably without the least exertion on his part—a fact which his relations were wont to deplore, being old-fashioned enough to prefer a young man with some object in life. Object, so far, he had none, except to make himself generally agreeable, and occasionally 'dabbling' in a dilettante fashion in Art. On these occasions he invariably assumed a velvetreen coat of extraordinary cut, and ruffled his hair till it stood on end like a furze-bush, as is the wont of amateurs of a certain class.

To-day, however, the garb of Art had been laid aside, probably on account of the heat; and he looked a very modern young man indeed, as he stood there in the bright sunshine, his brow somewhat puckered up, as if he were endeavouring to solve some hard problem. And so he was—the problem of where to go for the month of August. His mother, a gentle sweet-faced woman, who loved and trusted her tall son entirely, knowing more than others did of the sterling qualities which underlay his apparent indolent good-nature, had left it to him to decide their destination; and the decision was a difficult one. Of course there was always the shooting to fall back on; but he did not particularly care for that just then; besides, he preferred going by himself in September. His mother had suggested a trip abroad; but that was slow. They had been so often; and it required such a fearful amount of exertion to speak those abominable jargons. No, no; France for the French, and England for the English, was his motto.

Suddenly a light broke across his face, and turning to his mother, who was reading on the sofa, he cried joyously: 'I know what we will do, mother! I've just thought of it.'

Mrs Standish laid down her book and looked up inquiringly. 'Have you, dear?' she said. 'What is it, then?'

'Why, you remember that little village Sanfield was talking about the other day, on the north coast somewhere, you know—well, it's just struck me that that would be the very place for us—nice and quiet, and lots of fishing and boating, to say nothing of sketching.—What do you think? Shall we go there?'

'It would be the very place, if you don't think you would find it dull without any companions but your stupid old mother. Nay'—laughingly, as Humphrey was about to speak—'I know what you would say; but all the same, I know that I, or indeed any elderly woman, would not be very lively company for a young man like you. However, of course, if you don't think you will find it stupid, I shall be only too glad to go there, instead of to Scarborough or Spa or any of those dreadfully crowded places. And perhaps, after all, we may meet some very nice people there; one can never tell.'

And so the great problem was settled; and the next week saw the little house in Wilton Street shrouded in a death-like stillness, like its neighbours; and the few people who still remained in town told each other, not without secret feelings of envy, that 'the Standishes had gone off to bury themselves in some nameless out-of-the-way little fishing village,' instead of following the tide of fashionable folks who were bent on repeating in a different way the various successes and struggles after Pleasure which they had been sustaining during the past season.

But Mark's Cove—in appearance, at least—amply compensated for any longing they might privately have had after more civilised society. Situated as it was on one of the wildest parts of the eastern coast of Scotland, surrounded on three sides by ranges of hills, backed by distant rims of purple mountains, and on the fourth lying exposed to the restless expanse of open sea with its ever-varying features of storm and sun—the little town, with its quaint ruggedly-built houses and straggling by-streets, was indeed a gem from an artistic point of view, and both Humphrey and his mother were delighted.

'That fellow Sanfield knows what's what,' the former would cry enthusiastically as he rowed his mother gently up and down the bay in the bright afternoon sun, 'or he would never have recommended this place. The only wonder is more people don't find out about it and come.'

But no one seemed to know about it, or else considered it beneath their notice, for their

landlady said that 'gentlefolks wasna just very plentiful thereabouts, at least they hadna been in her time;' and it certainly seemed true, for they had been there over a fortnight without seeing any one of their own class, except an occasional tourist who passed through on his way farther north.

It was therefore with no small surprise and excitement that one evening, as they were sitting down to supper, they saw a cab laden with luggage draw up in front of a small house on the opposite side of the way. Regardless of *les convenances*, Humphrey jumped up and went to the window just in time to see two figures—one an elderly lady, well muffled up, and the other a young girl, in a long gray cloak and close-fitting little cap—enter the house-door. They were followed by a third, evidently a maid, who was superintending the disposal of the luggage.

'I declare I'm not sorry some one has come to share our solitude!' he cried as he returned to the tea-table. 'I only hope they are nice. The girl looked rather jolly, as much of her as I could see in the uncertain light; but the old lady seemed rather forbidding.'

'Well, we are sure to see them soon to speak to, and then you can judge more correctly;' and Mrs Standish drew back the curtain as she spoke and looked in her turn across the dusky street. But all was still again. The cab had turned away round the corner, the green door of the house opposite was closed as firmly as ever, and save for a fresh light in the front window, everything looked as before.

The next morning Humphrey was up betimes. He had arranged to go out fishing that morning with his landlord's son; and the two swallowed a hasty breakfast and were away on the calm sunlit water long before the blinds in the opposite house were drawn up. It was a splendid morning; and the little craft, rowed by the four stout arms, danced along as if she had been alive; and it was not long before they reached their accustomed fishing-ground, where, dropping their anchor, they let down their lines. Fishing, as all who have tried it know, is terribly engrossing work, especially when you make anything like a good catch; and it was eleven o'clock before either of the young men thought of turning. Then Humphrey, looking at his watch, suddenly recollected that he had promised to take his mother out for a short row that morning; and hastily pulling in their tackle, he and his companion made swiftly for the shore.

There, on the narrow strip of shingly beach upon which the boats were moored, sat his mother, and by her side the elderly lady whose advent the previous evening had caused such excitement. The girl was standing some little way off with her back towards them. As he leaped out of the boat, tossing the fish into a shining heap upon the beach out of reach of the waves, Mrs Standish called to him. 'Humphrey, come here; I want to introduce you to a very old friend. This is Miss Marchmont, who used to be a school-fellow of mine.—Amelia, this is my son Humphrey.'

The young man bowed politely, apologising as he did so for not shaking hands. 'That fishing is such awfully dirty work, you know,' he said, smiling.

He was just turning away, when Miss Marchmont said kindly: 'Allow me to introduce you to my niece.—Avice, dear, this is another acquaintance for you.'

The girl thus suddenly addressed turned sharply round, showing one of the most lovely faces Humphrey had ever seen, crowned by masses of wavy hair of the intensest black. Her complexion was perfectly dark, like that of a Spaniard, and the eyes which glanced up at him with a smile of greeting were half hidden by their thick veil of curly dark lashes. The eyes themselves, strange to say, were of a dark blue.

'I am very glad to make another acquaintance,' she said, as she extended a dainty little hand, which Humphrey had much difficulty in refraining from accepting, 'for I certainly thought we were the only people here, until we met your mother.' Then catching sight of the silvery pile of fish at her feet, she cried joyously: 'Oh, how delicious! You fish, do you?—Oh auntie, do let me go too. I love fishing.'

'Really, my dear,' expostulated Miss Marchmont with a comical sigh, 'you should not get so excited. Supposing Mr Standish did not wish to take you, what a very awkward position you would place him in!'

A slight flush tinged the pure olive cheek, and she was looking up with an expression of penitence, when something in the intense amusement depicted on Humphrey's face struck her, and instead she went off into peals of light girlish laughter.

The young man laughed too, and murmuring something about being 'most happy,' disappeared up the beach.

Thenceforward the days passed very quickly, and the new-comers had been at Mark's Cove a whole week before they had half realised that they had been there two days. It was now the second week in August, for the Standishes had left town the third week in July, and the weather was perfectly glorious.

'I never knew such weather before,' said Humphrey one day as he and Avice sat sketching and chatting on the top of one of the braes. 'You must have brought it with you; for I'm sure it was not half so fine before you came.'

'It has certainly been splendid,' she replied, throwing down her paint-brush in despair of ever catching the peculiar tints of sea and sky—'too splendid to last, I'm afraid. And then we've been having such a delicious time of it, boating and fishing and all that, and do you know it makes me half uncomfortable.'

'Uncomfortable!' echoed Humphrey, bending his head critically to one side, as if to scrutinise his own drawing, but in reality to catch a glimpse of his companion's—'uncomfortable! Why?'

'Well, I don't quite know,' Avice returned, half shyly, 'except that when one has been having an extra good time of it, it always seems as if some misfortune were sure to follow it—by way of balance, as it were.—Don't you ever think that?'

'The only evil which I see imminently impending,' said Humphrey, 'is the danger of your rolling neatly over the top of the cliff into the water below; and to avoid that catastrophe I should advise you to come a little more inland. It will be safer at least, if less romantic.'

But his warning came too late. Turning round sharply at his words, Aviee insensibly advanced nearer the edge, and the next instant she was over.

'My God!' burst involuntarily from Humphrey's white lips as he rushed forward to the spot where she had disappeared—'How shall I save her?' As he uttered these words, he looked down the dizzy height, and saw the girl's slight form hanging as it were betwixt sea and sky, her progress arrested, for the time at least, by a bush of yellow furze.

'Aviee!' he cried, steadying his voice with difficulty for fear of alarming her, 'do you think you can hold on till I come?' But there was no reply, only the murmuring splash of the cruel waves below as they lashed themselves angrily upon the rocks and beat high against the foot of the cliff, as if hungry for their prey.

Humphrey set his teeth firmly together and prepared to descend the steep side of the cliff. A sickening dread seized his heart as he did so. Suppose he was too late—suppose she were dead? He dared not stop to think; but began slowly, carefully descending, catching for support at anything which came in his way, and knowing well that one false step would hurl him down, too, on to that terrible mass of wave-worn rocks below. At last, after minutes of wary clambering, which in point of extent seemed to him like years, he reached the bush with its precious burden. Steadying himself carefully with one foot on a firm ledge of grass-grown rock, and the other leg bent into a kneeling position, he leant forward and endeavoured to raise her. Slowly, painfully, for she hung like a leaden weight in his arms, he managed at last to get hold of her, and then commenced the return journey. If the descent had been dangerous, the ascent was still more so, especially to one laden as he was with a human burden, and every moment he seemed to feel his foot slipping backwards, and terrible visions of their joint fate in such a case rose before his mind.

How he managed the climb he never could remember; but at last he stood once more on the breezy hill-top, the scent of the salt water mingled with the fainter one of wild thyme blowing round him, and the bright August sunlight gleaming over the white unconscious form at his feet.

That she was merely unconscious, and not dead, he had perceived when he first touched her as she hung from the golden thorn-bush; and now kneeling down by her side he chafed her cold hands in his strong warm ones and sprinkled the water in her little tin painting-can over her white face, until at last the heavy lashes were raised and the eyes below gazed wonderingly up into his face.

'What is it?' she murmured, half raising herself on her elbow. 'Why do you look so frightened, and why does my head feel so queer?'

'You have had a bad fall, Miss Marchmont,

and must keep quiet,' replied Humphrey. 'Thank Heaven! it is nothing more,' he added in a lower tone, thinking again of the awful sight he had witnessed.

'Let me see. I fell, didn't I?' she inquired, looking up into his face. 'Oh yes; I remember now. I went down, down, ever so far, until at last all became dark, and I remember nothing more until I saw you standing by me and felt all the water trickling down my neck.' And sitting up, she tried to dry her face and neck with her handkerchief.

Thankful to find her so little the worse for her adventure, Humphrey helped her as best he could; and then, rolling his coat up in the form of a bolster, bade her lie still while he collected their joint materials and made them ready to take home.

'It is very funny, you know, that I should just have happened to roll off the cliff at the time when I was prophesying some misfortune,' remarked Aviee, as at length they turned their steps homeward again. 'I little thought my words would have such a swift fulfilment.'

'The moral thereof is, don't prophesy evil, and especially not on the edge of a cliff. At anyrate, please don't do so in my company. You don't know what a fright you gave me.'

Miss Marchmont was naturally a good deal alarmed by the account of what had happened, and surveyed Aviee critically from head to foot through her gold-rimmed spectacles to make sure that no bones had been broken.

It was with difficulty that they could persuade her not to put an entire veto on all rambles of any sort from that day forward; and before Humphrey retired across the road, she had succeeded in impressing him very strongly with a sense of his utter unworthiness—in her eyes at least—to escort Aviee into dangerous places.

One thing more that day's work had done for Humphrey Standish—it had revealed to him the state of his feelings towards Aviee Sacharty. Hitherto, he had not thought of her otherwise than as a friend—a very dear one, but still merely a friend, a girl with whom he had associated on much the same terms as he did with the other girls with whom he was thrown in contact. Henceforth, he must regard her as the woman of his choice, a woman to be wooed earnestly and won at any cost, one whose slightest wish was more to him than any law yet framed—in short, Humphrey Standish was in love. The feeling was a novel one, for he was not one of those youths who have a fresh amour every month. He had never cared much for the girls he had met in society. They were all very well to talk to, very bright and lively, some of them—clever even, often enough; but there was a something lacking about them—a want of that which goes to make up true conjugal happiness—an unreality and sham which were totally foreign to his nature, and from which he instinctively recoiled.

Aviee Sacharty had none of this. Living as she had done almost all her life in the seclusion of the country, mixing only in moderation in the county society, there was a freshness and true enthusiasm about her which, unfortunately, seen now to be becoming rarer every day. And then, thrown as she and Humphrey had been so entirely

on one another's society, their natures had gone out towards each other as they could never have done under any other circumstances; so that it was small wonder that, insensibly and, as it were, in spite of himself, the young man should have grown to regard his companion with feelings warmer than those of mere friendship or admiration.

SOMETHING ABOUT EARTHWORMS.

By F. E. BEDDARD, M.A., Prosector of the Zoological Society of London.

THE earthworm is an animal which has not received that attention from zoologists which it deserves, in spite of the fact that its habits and structure formed the last of that magnificent series of volumes with which Darwin enriched scientific literature. And it has not only been neglected by naturalists, but has incurred the bitter enmity of gardeners and farmers. It is true that the gardener has some reason for his dislike, when he sees his carefully-rolled walks and smooth lawns rendered unsightly by the heaps of earth with which the worm diligently covers them. But the farmer has no business to complain, for not only do earthworms form a large part of the food of many birds, which would perhaps in their absence direct their attention more closely to his crops and fruit-trees, but they are of positive advantage in loosening the soil, and so making passages for the rain to trickle down to the lowest roots. More than a hundred years ago Gilbert White devoted one of his letters to the subject of earthworms, and defended them from the accusation of uselessness and injuriousness in the economy of Nature, remarking further, and so to a certain extent anticipating Darwin, that they are often responsible for the formation of new soils.

In this country the earthworm is perhaps the most abundant animal of any size; it would be difficult not to meet with worms by digging in almost any locality; and yet it is one of the most persecuted creatures that breathe. Not only do birds hunt it unceasingly; but the gardener, armed with a watering-pot and solution of corrosive sublimate, slays his tens of thousands. When they seek for refuge deep down in the soil, they are pursued by moles; centipedes and various insects attack them; and, in fact, every one's hand is against them. But, in spite of this general hostility on the part of animate creation, they thrive and multiply. The first and principal reason for this is their great fertility; and the second is their great power of recovery after accidents which would rapidly terminate the existence of more highly-organised creatures. An earthworm can lose a considerable portion of itself without suffering, apparently, even temporary inconvenience; and indeed some of the fresh-water annelids, which are near relations of the earthworm, voluntarily divide themselves into several pieces, each of which becomes a new worm.

A slight acquaintance with the anatomy of an earthworm enables us to understand why this should be the case. The body is divided into a number of rings, or 'segments,' as they are more generally termed; and the internal organs, instead of being distributed among the segments, are for the most part repeated from segment to segment. It follows, therefore, that when the gardener's spade shears off several inches of a worm, the animal is not deprived of one or more essential organs, but only of a less or greater number of parts of these organs. Spalanzani was the first naturalist who made—about two hundred years ago—experiments of this kind, which proved, as a subsequent writer pointed out, that 'by a strange paradox in nature, the most useless and contemptible lives are, of all others, extinguished with the greatest difficulty.'

In addition to these advantages in its construction, the earthworm has a certain amount of cunning, which must enable it to escape some foes. On mild wet evenings, innumerable worms may be seen lying out with the ends of their tails fixed in their burrows; on the slightest alarm they rapidly retire underground. It is a remarkable fact that in two kinds of earthworms, inhabitants of the New World, the little bristles, which are the locomotive appendages, are greatly enlarged in the tail segments. In one of these, which I have described under the name of *Diacheta Windlei*, the bristles in question are enormously enlarged and of a hook-like form, so that the creature must be able to retain a very firm grip upon the soil. These facts are surprising, as an earthworm is perhaps an animal in which we should not expect much manifestation of intellect; but, on the other hand, Mr Romanes' discoveries about the intellectual possibilities of 'Sally' the chimpanzee may be regarded as having moved the whole animal creation up a peg or two in mental calibre.

Besides the active enemies which are continually seeking to destroy earthworms, though apparently with comparatively little effect, these animals have a habit of seeking destruction on their own account, which looks very like a determined effort at suicide. On any wet morning the shallow puddles in the roadways and elsewhere are often occupied by the dead bodies of worms, or by individuals at their last gasp. Have these worms voluntarily sought a watery grave? Or do they represent, as Darwin thought, merely the sickly and dying individuals which have been washed out of their burrows by the rain? Darwin's explanation is probably partly true; but it is also credible that the heating of the puddles by the sun's rays has something to do with the great mortality of the annelids. Cold fresh water seems to be practically harmless, though salt water is rapidly fatal to earthworms. M. Perrier, a French naturalist, who has paid great attention to the group, kept various species submerged in water for months uninjured; and in this country there is one species, and another in the Falkland Islands, which commonly passes its entire life or a great portion of it in streams and pools. The name earthworm is therefore somewhat misleading when applied to these forms,

which have, however, no particular relation to the normally aquatic allies of earthworms.

There is one species of earthworm in Great Britain, known to fishermen as the 'brandling,' which has a peculiar means of defence that does not appear to be at all common in the group. The brandling is very dark brown, with yellowish bands, and when irritated, it can exude a yellowish fluid. This worm seems to be acceptable enough to certain fishes; but the truth of the proverb, 'One man's meat is another man's poison,' is illustrated by the fact that it is not palatable to lizards. I have been informed that they either reject it with disgust, or, if they do taste it, are rewarded for their indiscretion by severe fits of illness. Now, this is a very curious fact; but it is paralleled elsewhere in the animal kingdom. Many brightly-coloured animals—particularly among insects—have been found to be either disagreeable in their taste or positively dangerous to other animals which habitually feed upon their like. And it is noteworthy that these unpalatable creatures have often the most markedly contrasted colours—that is, black and yellow; for example, the wasp and the hornet, the coral snake and the heloderma lizard (the Gila Monster). The theory has been advanced that the conspicuous colours have been developed in order to advertise their dangerous nature, or the unpalatable qualities of their flesh; so that they may escape such injuries as might be inflicted by an animal desirous of experimenting upon them as articles of food. This 'warning coloration' seems to say to the would-be aggressor: 'Don't touch me; I'm poisonous.' It confers a benefit at once upon the oppressor and the oppressed; rendering the one free from attacks, and warning the other that such attacks will probably be followed by serious consequences. It looks very much as if the brandling was another example of this same phenomenon.

A very important fact in the economy of earthworms is their susceptibility to salt water; they are for the most part soon killed by an immersion in salt water, and it appears that their eggs are also incapable of withstanding its influence for a prolonged period. However, the eggs are not deposited singly, but are enclosed in large numbers in an egg case of a leathery consistence, which may be, for a time at least, impermeable to sea-water. It is therefore just conceivable that the cocoons might cross in safety a narrow sea enclosed in a ball of earth upon the roots of a floating tree. But it seems certain that a very long time does not elapse before the eggs in the cocoon are fatally injured by the sea-water. The only exception at present known is an earthworm which is found in heaps of cast-up seaweed on the sea-shores of the Mediterranean and North Sea.

These facts are important, because they show that if we find the same species of earthworm in two countries now separated by the sea, there must have been originally a continuity of land; hence their value in relation to the problems of geology, which are rendered clearer by the geographical distribution of animals. A striking instance of this is shown by comparing the earthworms of Europe and North America; by far the greater number of forms are common to the two continents; and geologists teach us that the

American and Asiatic land-masses have probably only been separated in recent times. A bridge of land once occupied the space where now Behring Strait is, and this enabled the land inhabitants of both countries to commingle. Although the importance of the group from this point of view seems to be obvious, it is curious that it has never been touched upon in text-books which deal with the subject of geographical distribution. This is perhaps partly due to the uncertainty of the data, which results from 'man's interference.' Man has exercised, in some respects, a very injurious influence upon the fauna and flora of the world; the introduction of domestic animals has helped to destroy the indigenous inhabitants in many parts of the globe, particularly in oceanic islands; and the traffic between different countries has mixed up their respective faunas and floras in a way which is heartbreaking to the naturalist. And in no group of animals has this been more felt than in that with which we are at present concerned; the introduction of plants has led to the accidental introduction of earthworms and such small fry. These cases, however, can generally be sifted out; and when we find in New Zealand four or five species which are characteristic of Europe and America, along with a number of others which appear to be confined to those islands, we are fairly justified in assuming that the former have been introduced through man's agency.

But after allowing for these instances, there are other problems of difficulty which await solution. Kerguelen and Marion Islands are 'oceanic islands'—that is, they are not fragments of previously existing continents, but originated *de novo* by volcanic agency. Although they are of old standing, it is very mysterious why there should occur on both of them the same species of earthworm, which has been named (by Professor Lankester) *Acanthodrilus Kerguelensis*. This form is, so far as we know, confined to those islands; but how did it get there, and from where? The floating-tree hypothesis will not do, for the reasons already stated. And it hardly seems likely that there was ever a brisk trade between South Africa—the nearest place where the genus occurs—and these islands in flower-roots!

THE BURGLAR'S GHOST.

I AM not an imaginative man, and no one who knows me can say that I have ever indulged in sentimental ideas upon any subject. I am rather predisposed, in fact, to look at everything from a purely practical standpoint, and this quality has been further developed in me by the fact that for twenty years I have been an active member of the detective police force at Westford, a large town in one of our most important manufacturing districts. A policeman, as most people will readily believe, has to deal with so much practical life that he has small opportunity for developing other than practical qualities, and he is more apt to believe in tangible things than in ideas of a somewhat superstitious nature. However, I was once under the firm conviction that I had been largely helped up the ladder of life

by the ghost of a once well-known burglar. I have told the story to many, and have heard it commented upon in various fashions. Whether the comments were satirical or practical, it made no difference to me; I had a firm faith at that time in the truth of my tale.

Eighteen years ago I was a plain-clothes officer at Westford. I was then twenty-three years of age, and very anxious about two matters. First and foremost, I desired promotion; second, I wished to be married. Of course I was more eager about the second than the first, because my sweetheart, Alice Moore, was one of the prettiest and cleverest girls in the town; but I put promotion first for the simple reason that with me promotion must come before marriage. Knowing this, I was always on the lookout for a chance of distinguishing myself, and I paid such attention to my duties that my superiors began to notice me, and foretold a successful career for me in the future.

One evening in the last week of September 1873, I was sitting in my lodgings wondering what I could do to earn the promotion which I so earnestly wished for. Things were quiet just then in Westford, and I am afraid I half-wished that something dreadful might occur if only I could have a share in it. I was pursuing this train of thought when I suddenly heard a voice say: 'Good-evening, officer.'

I turned sharply round. It was almost dusk, and my lamp was not lighted. For all that, I could see, clearly enough, a man who was sitting by a chest of drawers that stood between the door and the window. His chair stood between the drawers and the door, and I concluded that he had quietly entered my room and seated himself before addressing me.

'Good-evening,' I replied. 'I didn't hear you come in.'

He laughed when I said that—a low, chuckling, rather sly laugh. 'No,' he said; 'I dessay not, officer. I'm a very quiet sort of person. You might say, in fact—noiseless. Just so.'

I looked at him narrowly, feeling considerably surprised and astonished at his presence. He was a thickly-built man, with a square face and heavy chin. His nose was small but aggressive; his eyes were little and overshadowed by heavy eyebrows; I could see them twinkle when he spoke. As for his dress it was in keeping with his face. He wore a rough suit of woollen or frieze; a thick, gaily-coloured Belcher neckerchief encircled his bull-like throat; and in his big hands he continually twirled and twisted a fur cap, made apparently out of the skin of some favourite dog. As he sat there smiling at me and saying nothing, it made me feel uncomfortable.

'What do you want with me?' I asked.

'Just a little matter o' business,' he answered.

'You should have gone to the office,' I said.

'We're not supposed to do business at home.'

'Right you are, guv'nor,' he replied. 'But I wanted to see *you*. It's you that's got to do my job. If I'd ha' seen the superintendent, he might ha' put somebody else on to it. That wouldn't ha' suited me. You see, officer, you're young, and nat'rally eager-like for promotion. Eh?'

'What is it you want?' I inquired again.

'Ain't you eager to be promoted?' he reiterated. 'Ain't you, now, officer?'

I saw no reason why I should conceal the fact, even from this strange visitor. I admitted that I was eager for promotion.

'Ah!' he said with a satisfied smile; 'I'm glad o' that. It'll make you all the keener. —Now, officer, you listen to me. I'm a-goin' to put you on to a nice little job. Ah! I dessay you'll be a sergeant before long, you will. You'll be complimented and praised for your clever conduct in this 'ere affair. Mark my words if you ain't.'

'Out with it,' I said, fancying I saw through the man's meaning. 'You're going to split on some of your pals, I suppose, and you'll want a reward?'

He shook his head. 'A reward,' he said, 'wouldn't be no use to me at all—no, not if it was a thousand pound. No; it ain't nothing to do with reward.—But now, officer, did you ever hear of Light-toed Jim?'

Light-toed Jim! I should have been a poor detective if I had not. Why, the man known under that sobriquet was one of the cleverest burglars and thieves in England, and had enjoyed such a famous career that his name was a household word. At that moment there was an additional interest attached to him. He had been convicted of burglary at the Northminster Assizes in 1871, and sentenced to ten years' penal servitude. After serving nearly two years of his time, he had escaped from Portland, getting away in such clever fashion that he had never been heard of since. Where he was no one could say; but lately there had been a strong suspicion amongst the police that Light-toed Jim was at his old tricks again.

'Light-toed Jim!' I repeated. 'I should think so. Why, what do you know about him?'

He smiled and nodded his head. 'Light-toed Jim,' said he, 'is in Westford at this 'ere identical moment.—Listen to me, officer. Light-toed Jim is a-goin' to crack a crib to-night. Said crib is the mansion of Miss Singleton, that 'ere rich old lady as lives out on the Mapleton Road. You know her—awfully rich, with nought but women-servants and animals about the place. There's some very valyable plate there. That's what Light-toed Jim's after. He'll get in through the scullery window about one A.M.; then he'll pass through the back and front kitchens and into the butler's pantry—only it's a butleress, 'cos there ain't no men at all—and there he'll set to work on the safe. Some of his late pals in Portland give him the tip about this 'ere job.'

'How did you come to hear of it?' I asked.

'Never mind, guv'nor. You wouldn't understand. Now, I wants you to be up there to-night, and to nab Light-toed Jim red-handed, so to speak. It'll mean promotion for you, and it'll suit me down to the ground. You wants to be about and to watch him enter. Then follow him, and dog him. And be armed, officer, for Jim'll fight like a tiger if you don't draw his teeth first.'

'Now, look here, my man,' said I. 'This is all very well; but it's very irregular. You must just tell me who you are, and how you

come to be in Light-toed Jim's secrets, and I'll put it down in black and white.'

I turned away from him to get my writing materials. I was not a half-minute with my back to him, but when I turned round he was gone! The door was shut, but I had heard no sound from it either opening or shutting. Quick as thought I darted to it, tore it wide open, and looked down the narrow staircase. There was no one there. I ran hastily down-stairs into the passage, and found my landlady, Mrs Marriner, standing at the open door with a female friend. 'Mrs Marriner,' I said, breaking in upon their conversation, 'which way did that man go who came down-stairs just now?'

Mrs Marriner looked at me strangely. 'There ain't been no man come down-stairs, Mr Parker,' said she—'leastways, not this good three-quarters of an hour, which me and Missis Higgins 'ere, as 'ave come out to take an airing, her having been ironing all this blessed day, 'as been standin' here all the time and ain't never seen a soul.'

'Nonsense!' I said. 'A man came down from my room just now—the man you sent up twenty minutes since.'

Mrs Marriner looked at me with an expression betokening the most profound astonishment. Mrs Higgins sighed deeply.

'Mr Parker,' said Mrs Marriner, 'sorry am I to say it, sir, but you're either intoxicated or else you're a-sickening for brain fever, sir. There ain't no person entered this door, in or out, for nigh on to an hour, as me and Missis Higgins 'ere will take our Bible oaths on.'

I went up-stairs and looked in the rooms on either side of mine. The man was not there. I looked under my bed, and of course he was not there. He must have gone down-stairs. But then the women must have seen him. There was only one door to the house. I gave it up in despair, and began to smoke my pipe. By the time I had drawn the last whiff I had decided that if any one was 'intoxicated,' it was probably Mrs Marriner and Mrs Higgins, and that my strange visitor had departed by the door. I was not going to believe that he had anything supernatural about him.

I had no duty that night; and as the hours wore on I found myself stern in my resolve to go up to Miss Singleton's house and see what I could make out of my informant's story. It was my opinion that my late visitor was a whilom 'pal' of Light-toed Jim's, and that having become aware of the latter's plot, he had, for some reason of his own, decided to split on his old chum. Thieves' disagreement is an honest man's opportunity, and I determined to solve the truth of the story told me. Lest it should come to nothing, I decided not to report the matter to my chief. If I could really capture Light-toed Jim, my success would be all the more brilliant by being suddenly sprung upon the authorities.

I made my plan of action rapidly. I took a revolver with me, and went up to Miss Singleton's house. Fortunately, I knew the housekeeper there—a middle-aged, strong-minded woman, not easily frightened, which was a good thing. To her I communicated such information as I considered necessary. She consented to conceal me in the room where the safe stood. There was

a cupboard close by the safe, from which I could command a full view of the burglar's operations, and pounce upon him at the right moment. If only my information was to be relied upon, there was every chance of my capturing the famous burglar.

Soon after midnight, when the house was all quiet, I went to the pantry and got into the cupboard, locking myself in. There were two openings in the panel, through either of which I was able to command a full view of the room. My position was somewhat cramped, but the time soon passed away. My mind was principally occupied in wondering if I was really about to have a chance of distinguishing myself. Somehow, there was an air of unreality about the events of the evening which puzzled me. Suddenly I heard a sound which put me on the alert at once. It was nothing more than the creaking of a board or opening of a door would make in a quiet house; but it sounded intensified to my expectant ears. I drew myself up against the door of the cupboard and placed my eye to the opening in the panel. I had oiled the key of the door, and kept my fingers upon it, in readiness to spring upon the burglar at the proper moment. After what seemed some time I saw the gleam of light through the keyhole of the door opening into the pantry. Then it opened, and a man, carrying a small lantern, came gently into the room. At first, I could see nothing of his face; but when my eyes grew accustomed to the hazy light, I saw that I had been rightly informed, and that the burglar was indeed no other than the famous Light-toed Jim.

As I stood there watching him, I could not help admiring the cool fashion in which he went to work. He went over to the window and examined it. He tried the door of the cupboard in which I stood concealed. Then he locked the door of the pantry and turned his attention to the safe. He set his lamp on a chair before the lock and took from his pocket as neat and pretty a collection of tools as ever I saw. With these he went quietly and swiftly to work.

Light-toed Jim was a somewhat slimly-built fellow, with little muscular development about him, while I am a big man with plenty of bone and sinew. If matters had come to a fight between us I could have done what I pleased with him; but I knew that Jim would not chance a fight. Somewhere about him I felt sure there was a revolver, which he would use on the least provocation. My plan, therefore, was to wait until his back was bent over the lock of the safe, then to open the cupboard door noiselessly and fall bodily upon him, pinning him to the ground beneath me.

Before long the moment came. He was working steadily away at the lock, his whole attention concentrated on the job. The slight noise of his drill was sufficient to drown the faint click of the key in the cupboard door. I turned it quickly and tumbled right upon him, driving the tool out of his hands and tumbling him upon a heap at the foot of the safe. He uttered an exclamation of rage and astonishment as he went down, and immediately began to wriggle under me like an eel. As I kept him down with one hand, I tried to pull out the handcuffs with the other. This somewhat embarrassed me, and the

burglar profited by it to pull out a sharp knife. He had worked himself round on his back; and before I realised what he was after, he was hacking furiously at me with his keen dagger-like blade. Then I realised that we were going to have a fight for it, and prepared myself. He tried to run the knife into my side. I warded it off; but the blade caught the fleshy part of my left arm, and I felt a warm stream of blood spurt out. That maddened me, and I seized one of the steel drills lying near at hand and hit my man such a blow over the temples that he collapsed at once and lay as if dead. I put the handcuffs on him instantly, and, to make matters still more certain, I secured his ankles. Then I rose and looked at my arm. The knife had made a nasty gash, and the blood was flowing freely; but it was not serious; and when the housekeeper, who just then appeared on the scene, had bandaged it, I went out and secured the help of the policeman I first met in conveying Light-toed Jim to the office.

I felt a proud man when I made my report to the inspector.

'Light-toed Jim?' said he. 'What, James Bland? Nonsense, Parker.' But I took him to the cells, where Jim was being attended to by the doctor.

'You're right, Parker,' he said. 'That's the man. Well, this will be a fine thing for you.'

After a time, feeling a bit exhausted, I went home to try and get some sleep. The surgeon had attended to my arm, and told me it was but a superficial wound. It felt sore enough in spite of that.

I had no sooner reached my lodgings than I saw, sitting in my easy-chair, the strange man who had called upon me earlier in the evening. He rose to his feet when I entered. I stared at him in utter astonishment.

'Well, guv'nor,' said he, 'I see you've done it. You've got him square and fair, I reckon?'

'Yes,' I said.

'Ah!' he said with a sigh of complete satisfaction. 'Then I'm satisfied. Yes, I don't know as how there's aught more I could say. I reckon as how Light-toed Jim an' me is quits.'

I was determined to find out who this man was this time. 'Sit down,' I said. 'There's a question or two I must ask you. Just let me get my coat off and I'll talk to you.' I took my coat off and went over to the bed to lay it down. 'Now then,' I began, and looked round at him. I said no more, being literally struck dumb. The man was gone!

I began to feel uncomfortable. I ran hastily down-stairs, only to find the outer door locked and bolted, as I had left it a few minutes before. I went back, utterly nonplussed. For an hour I pondered the matter over, but could make neither head nor tail of it.

When I went down to the office next morning I was informed that the burglar wanted to see me. I went to his cell, where he was lying in bed with his head bandaged. I had hit him pretty hard as it turned out, and it was probable he would have to lie on the sick-list for some days. 'Well, guv'nor,' said he, 'you'd the best of me last night. You hit me rather hard that time.'

'I was sorry to have to do it, my man,' I

answered. 'You would have stabbed me if you could.'

'Yes,' he said, 'I should.—But, I say, guv'nor, come a bit closer; I want to ask you a question. How did you know I was on that little job last night? For, s'elp me, there wasn't a soul knew a breath about it but myself. I hadn't no pals, never talked to anybody about it, never thought aloud about it, as I knows on. How came you to spot it, guv'nor?'

There was no one else in the cell with us, and I thought I might find out something about my mysterious visitor of the night before. 'It was a pal of yours who gave me the information,' I said.

'Can't be, guv'nor. No use telling me that. I ain't no pals—leastways not in this job.'

'Did you ever know a man like this?' I described my visitor. As I proceeded, Light-toed Jim's face assumed an expression of real terror. Whatever colour there was in it faded away. I never saw a man look more thoroughly frightened. 'Yes, yes,' he said eagerly. 'In course I know who it is. Why, it's Barksea Bill, as I pal'd with at one time.—And what did he say, guv'nor—that he owed me a grudge? That we was quits at last? Right you are, 'cos he did owe me a grudge. I treated Bill very shabby—very shabby indeed, and he swore solemn he'd have his revenge. On'y, guv'nor, what you see wasn't Barksea Bill at all, but his ghost, 'cos Barksea Bill's been dead and buried this three year.'

I was naturally very much exercised in my mind over this weird development of the affair, and I used to think about it long after Light-toed Jim had once more retired to the seclusion of Portland. While he was in charge at Westford I tried more than once to worm some more information out of him about the defunct Barksea Bill, but with no success. He would say no more than that 'Bill was dead and buried this three year;' and with that I had to be content. Gradually I came to have a firm belief that I had indeed been visited by Barksea Bill's ghost, and I often told the story to brother-officers, and sometimes got well laughed at. That, however, mattered little to me; I felt sure that any man who had gone through the same experience would have had the same beliefs.

Of course I got my promotion, and was soon afterwards married. Things went well with me, and I was lifted from one step to another. In my secret mind I was always sure I owed my first rise to the burglar's ghost, and I should have continued to think so but for an incident which occurred just five years after my capture of Light-toed Jim.

I had occasion to travel to Sheffield from Westford, and had to change trains at Leeds. The carriage I stepped into was occupied by a solitary individual, who turned his face to me as I sat down. Though dressed in more respectable fashion, I immediately recognised the man who had visited me so mysteriously at my lodgings. My first feeling was one of fear, and I daresay my face showed it, for the man laughed.

'Hallo, guv'nor,' said he; 'I see you knew me as soon as you come in. You owes a deal to me, guv'nor; now, don't you, eh?'

'Look here, my man,' I said; 'I've been

taking you for a ghost these five years past. Now, just tell me how you got in and out of my room that night, will you?"

He laughed long and loud at that. 'A ghost?' said he. 'Well, if that ain't a good un! Why, easy enough, guv'nor. I was a-lodging for a day or two in the same house. It's easy enough, when you know how, to open a door very quiet and to slip out too.'

'But I followed you sharp and looked for you.'

'Ay, guv'nor; but you looked *down*, and I had gone *up*! You should ha' come up to the attics, and there you'd ha' found me.—So you took me for a ghost? Well, I'm blowed.'

I told him what Light-toed Jim had said in the cell.

'Ay,' said he, 'I dessay, guv'nor. You see 'twas this way—it weren't Jim's fault as I wasn't dead. He tried to murder me, guv'nor, he did!—and left me a-lying for dead. So I ses to myself when I comes round that I'd pay him out sooner or later. But after that I quit the profession, Jim's nasty conduct havin' made me sick of it. So I went in for honest work at my old trade, which was draining and pipe-repairing. I was on a job o' that sort in Westford, near Miss Singleton's house, when I see Light-toed Jim. I had a hidea what he was up to, havin' heard o' the plate; and I watches him one or two nights, and gets a notion 'ow he was going to work the job. Then, o' course, you being a officer and close at hand, I splits on him—and that's all.'

'But you had got the time and details correct?'

'Why, o' course, guv'nor. I was an old hand—served many a year at Portland, I have, and I knew just how Jim would work it, after seeing his perlim'nary observations. But a ghost! Ha, ha, ha—why, guv'nor, you must ha' been a werry green young officer in them days!'

Perhaps I was. At anyrate, I learnt a lesson from the ci-devant Barksea Bill—namely, that in searching a house it is always advisable to look up as well as down.

THE DOMADOR.

PROBABLY there is no calling followed by man in which the element of danger to life and limb is more closely associated than in that of the Domador or horse-tamer of the South American Pampas; and certainly there is none in which daring courage, resolute will, and cool nerve are more necessary. There is little in common between the craft of the English horsebreaker and that of the domador. The former may expatiate on the trouble and danger attending the breaking-in of a 'wild young colt;' but after all, the colt springs from a line of more or less domesticated sires, and—according to modern theories—should be a more ductile and breakable animal than the wild descendant of a long line of untamed progenitors bred on the trackless plains of the South American continent.

The fearless daring of the swart domador—half Indian, half Spaniard—can only be thor-

oughly appreciated by those who have been eye-witnesses of the feats he performs in catching, mounting, riding, and taming a young horse of the Pampas. The means employed in trapping and selecting a particular animal are various. Sometimes the 'lasso' or the 'bolas' is used; but more frequently a whole 'tropilla' is driven up from a distant 'potrero' or grazing-ground, to an extensive corral, with an entrance wide enough to admit the passage of only two or three animals at a time. Above this entrance, which is necessarily of great strength, a stout crossbeam is fixed at the height of from six to eight feet above the ground. On this the domador squats himself and waits, cool and prepared, while the herd of wild horses is driven up and urged into the enclosure. This alone requires nerve; for the impetuosity and impact of a tropilla of from fifty to a hundred animals struggling in a mass together would seem sufficient of themselves to overturn the supports of the gates and trample them and the domador under foot. But a wholesome fear of the strange object crouched up above acts as a curb to regulate the struggling to pass the barriers.

Amidst this mass the quick eye of the domador soon singles out a horse suitable to his requirements, perhaps the finest and most vigorous of the whole tropilla. As the animal passes beneath the crossbeam—swift as a dart, unerring as the lasso—the domador drops upon his back and rides on with him into the spacious corral. The terrified brute plunges and rears and rushes madly here and there, rousing the whole herd into a state of excitement and fear. Once free of the danger of collision with the herd, which has fled to the farthest corner of the corral, the domador whips from his arm a large and coarse cloth, with which he promptly succeeds in blindfolding the captured horse, and then begins in a variety of ways to master the proud wild spirit beneath him. The horse will kick out in all directions, plunge and rear, whirl round and round, backwards and forwards, and even roll over and over; but as well might he attempt to shake off his own mane as to rid himself of that terrible incubus, the domador. The latter, of course, takes care that the animal does not roll over him. He simply steps off and stands aside till the brute picks himself up again, only to find that the grip on his sides is there strong as ever. Blindfolded as he is, he cannot see his tormentor, although at times he manages to elude the latter's grasp and attempt flight; but the ready lasso speedily arrests his mad course. As a rule, before the horse has had time to regain his feet the domador has contrived to slip into his mouth the cruel massive bit used all over the Platine countries.

The effects of this new instrument of torture are fearful. Maddened by the pain, quivering with rage and fear, the animal dashes away in any direction, forced by the cruel bit now to this side and now to that, until the domador at length succeeds in forcing him through the gates of the corral out on to the wide open camps. Then begins a mad race for liberty or the mastery of a noble spirit. At a speed to which terror, pain, and fury lend wings, horse and man thunder over

the ground, which seems literally to fly beneath their feet. Foam drops like flying scud on each side of the horse; his nostrils dilated and his eyeballs distended; mane and tail streaming on the wind which their speed creates; the tamer seated cool and grim, hand and eye alert, and every faculty bent upon overpowering the fierce beast he bestrides. Thus they pursue their wild flight for many leagues; and the domador knows that when the brute's mad rage is spent and his strength exhausted, he will slacken his headlong pace more and more, until he almost completely halts; and soon, breaking out into a fit of trembling, surrender for ever the savage freedom of his untamed state. The rest of his education is easy, and need not be told.

Amongst the many accidents to which the domador is peculiarly liable, none is of such frequent occurrence as a crushed leg or a broken knee-cap. Sometimes a horse in rushing from the corral will skim dangerously near to one of the gate-posts; and unless the domador be very active and smart, he is likely to be hurtled with all the brute's force against some projection. I once saw a domador caught in this way. His knee-cap was broken, yet he pluckily refused to give in until he had tamed the fierce animal he bestrode. But he was laid up for six months afterwards.

Occasionally it happens, too, that a horse of unusual mettle and fierceness will get hold of the bit, and then let the domador look out for his life! His means of controlling the animal are gone. All he can do is to keep his seat till the horse has run himself out. Provided the ground before them is clear, there is not much danger to be apprehended; but if, as oftentimes is the case, there is much broken ground, intercepted by burrows and holes of all kinds, the domador needs all his cunning and skill to avert the constantly recurring dangers. As a case in point, there occurs to my recollection the tragic end of a domador called Santiago, who, though an Irishman by extraction, had lived nearly all his life in the southern camps of Buenos Ayres, and had attained a wide renown as a skilful and courageous tamer. Though given occasionally to intemperate habits, Santiago could generally be relied on, and had successfully broken scores of horses without any more serious mishap than an occasional broken limb. One day, however, a few years ago, he mounted a horse 'wid the divil in 'im,' and this tameless brute managed to get the bit between his teeth and bolt with poor Santiago. No power on earth could control or turn him one way or another; he simply tore straight on at an infuriated speed which baffles description. It is rare indeed that a domador in such a situation loses his head. If the worse comes to the worst, he prefers to throw himself off the horse's back and risk breaking his neck that way rather than be thrown. But I fancy that Santiago must have been celebrating some *fiesta* that day with copious libations to the bacchanalian deities, and so become reckless. Not otherwise can I account for his total obliviousness to the frightful dangers that menaced him on all sides. The district through which he was being literally hurled is a wild and barren region of sandhills and ridges, which extends

along the South Atlantic coast from Mar del Plata to Necochea. Just at a point between these two places, called the Loberia, the cliffs or *barrancas* bordering the ocean are of great height, while on the summit there is—an oasis in a desert of sand—a very considerable stretch of comparatively level greensward. It was towards this fatal spot that Santiago and his fiery Bucephalus were approaching at a thundering pace through herds of cattle and flocks of sheep, which they sent scampering in all directions. No human being was within sight, no human habitation anywhere for miles, no witness to behold the awful tragedy about to be enacted in the full glory of the summer sun. Indications discovered some time afterward pointed to the probability that, as they drew near to the edge of the fatal cliff, Santiago must have become suddenly apprised of the magnitude of his danger, and tried with all his power and cunning to make the animal swerve, even on the edge of the cliff; but to no purpose; and doubtless before even the thought of throwing himself to the ground had had time to filter through his muddled senses, horse and man were launched into space, sheer over the cliff, and were dashed to pieces on the rocky shore hundreds of feet below. Their mangled remains, discovered some days afterwards, partly devoured, were the only clue to the mystery of the fate that had befallen the poor domador.

OUR BRIDGE.

FRIENDS dwell asunder, but hearts are near;
Love knows no distance, no there, no here;
Invisible bridges connect souls still,
And spirits cross them at Fancy's will.

The days of old wrought our magic chain;
They wove it of memories, joy and pain;
It lengthens, strengthens, as time goes by;
New links are forging of smile or sigh.

The trackless ocean our Bridge can span;
And mountain ranges too vast for man;
The desert wild cannot break its spell,
Which owns no limit, if hearts love well.

It bridges over the gulf of Death;
Our dead ones breathe with our own warm breath;
Our pulses beat with the same keen thrill;
We see them, hear them, and hold them still.

In the changeless heaven our Bridge takes rise,
Uniting earth with the far-off skies;
Its lights are star-gleams from angels' eyes,
Its echoes the voices of Paradise.

At times, when the night is still and clear,
When earth seems distant, and heaven more near,
Across the stillness there floats this song:
'Hope ever, true hearts; be brave—be strong,
For Time is brief, but Eternity long.'

A CHESHIRE MERE.

PROBABLY no English shire of the same size can boast the possession of so many good-sized natural sheets of water as the county of Chester. Shropshire has meres not a few; and East Anglia has its lakeland, the district of the Norfolk Broads; but neither furnishes an exact parallel as regards natural features with the Cheshire plain, which is so thickly dotted with lakelets, great and small, that we naturally look about for some explanation of their presence. And here geology steps in with a ready answer; so we must be geological, but only for a moment. Every one knows of the great deposits of rock-salt which underlie this part of the country; and most of us have seen pictures of deserted villages or houses, whose tottering walls, thrown sadly out of the perpendicular, suggest the work of an earthquake. The disaster is of course due to subsidence, the settling down of the ground owing to the mining and burrowing operations which have gone on below. Now, suppose Nature, centuries ago, to have worked some of these salt-beds in her own fashion by allowing the steady infiltration of water—as the saline deposits dissolved, the ground, subsiding, formed the hollows which the meres now occupy. As an item lending support to this theory, we are told that in the depths of one of the deeper meres a kind of fish is occasionally met with which is only found elsewhere in the brackish water of estuaries. If so, there is probably sufficient saline matter remaining in the bed of this particular pool to affect to some extent the composition of the water which comes into contact with it.

The Mere which we know best is one of the largest of the group. It is a fine pool of over a hundred acres, and withal so near to the great Lancashire hive, that half an hour's run, even of the slowest of stopping-trains, brings us within an easy walk of it. It is difficult to realise that we are only a dozen miles or so from one of England's noisiest and busiest industrial centres. The lake lies in a natural hollow, the ground

almost everywhere rising from its margin. No obtrusive new-built villas break the sweep of greensward which stretches down from below the sheltering fringe of coppice to the ripple-marked water-line. Hardly a house is in sight; but, overlooking the head of the lake, a church tower, built strong and square of the red sandstone of the district, just shows amongst elms and aspens. The village just beyond it is unseen; but entering it, we are struck by an air of neatness and quiet prosperity unusual even in a district all of whose villages are pretty. There is no public-house in the hamlet, and one feels that a newspaper less than two days old would be out of place. We enter the churchyard through the old carved lych-gate. Inside the church itself is a chapel, whose marble monuments bespeak the resting-place of members of an old and titled family. The mystery is explained: all around stretches the estate of one of the greatest landowners of the country-side; and to this it is due that the lake lies below us in all its unspoilt beauty. If its surroundings were in the hands of smaller proprietors, the building speculator would be here in a week; so let many-acred landlordism at the worst never want one argument to lean upon.

It was a typical spring day, gusty, with sudden bursts of sunshine, when we paid our first visit to the lake. The pool looked its very best, rippled by a breeze of a softness most unusual for March. The wood which borders its far side still rose dark and leafless above its fringe of gaunt, yellow reed-stems; but below the church, where the stream enters the lake, the poplars and alders were so betasselled with red and yellow catkins, that all their winter bareness was gone. Peewits were crying and tumbling above the fallows; and the hares cantered about in their leisurely, shambling fashion amongst the springing corn, unmindful of a legislature soon to decide their fate. In the osier-carr where the overflow leaves the lake, the first golden willow-blossom shows—the 'palm,' which marks in Nature's calendar that Easter-time is near, as plainly as do the round buds of

marsh-marigold, just showing a glimpse of yellow petals as they unfold 'in swamps and hollows gray.'

And now is the time to renew our acquaintance with the bird-population of the mere, before a new upgrowth of reeds furnishes them with cover which their hidling nature is not slow to take advantage of. Foremost are our especial favourites the grebes, quite the feathered aristocrats of the mere. Fine birds they are, rather longer in the body than a duck, and swimming lower in the water, we think. At a distance we can tell them by their greater slimmness, and by the straight upright neck (a duck always swims with its head between its shoulders), even if we do not catch the glint of sunshine on their snowy breasts. What it is that gives these breast feathers such a glistening lustre we do not know, but in this lies their value as a material for boas and muffs. But the curious headgear of the grebe is, after all, his chief point. A double crest above gives place below the chin to a richly-coloured tippet of chestnut edged with black. The male possesses these ornaments in a larger degree than the female, and in spring we have watched him go through a sort of head-bobbing performance to show them off to the best advantage, expanding his tippet meanwhile to a half-moon shape. His mate swims near by with her head back and crests laid flat, so like a duck, that without the telescope's aid we might take her for such. At this season, too, we hear their croaking call-note almost constantly; and one or other of the pair will flap for some distance along the surface of the water; but we have never seen a longer flight undertaken. To find a grebe's nest we must wade through the reed-beds in June, carefully prying into every heap of vegetable matter we come across, for the nest—quite too complimentary a term, by the bye, to apply to it—is merely a floating mass of decaying water-weeds and sedge. More often than not, it is soaking wet; and we could never persuade ourselves why the eggs do not addle. When newly laid, they are white; but if long sat upon, one would hardly guess it, so deeply ingrained with dirt do they become. This discoloration is partly due to the habit of the maternal grebe of covering them with freshly-pulled water-weeds, should she be forced to leave them.

But there are other elements in the bird-population of the pool. Standing by the lake-side one day in March, we watched a dabchick, a humble relative of the big crested grebes, diving time after time a little way out from the sandy shallows, turning the neatest of somersaults every time he went under. Away over by the side of the wood was a whole fleet of dusky coots, in whose company we note a distinguished stranger, a fine drake tufted duck, who shows his white under-parts as he turns broadside on.

A month later, the merry distich of the chiff-chaff, the first arrival from over seas, resounded through the wood by the lake-side. A few days later, the willow-wrens followed in the track of the hardy adventurer; while the first swallows and sand-martins dipped to make widening circles on the unruffled surface of the pool. As we push our way through the sedge and willows—as noiselessly as may be, for the field-naturalist who knows his business does not advertise his

presence—a startled pair of wild-ducks, the green-headed, ruddy-breasted drake and his more sober-coloured mate, rise with clamour of voice and wings. Amongst the debris of last year's growth of flags and loosestrife is an artless nest, in which a hen-pheasant has laid her ten olive-brown eggs; while two others of different form and colour have evidently been added to its contents by the duck which we disturbed from close by. Such cases of mixed ownership are not uncommon, especially amongst game-birds: a pheasant and partridge have been known in several instances to own such a joint-stock nest.

In early May the wood looked its best, at least so we thought as we waded ankle-deep in sweet-scented blue-bells and tall spikes of purple orchis. In one spot, where tussocks of coarse sedge hid a soft and treacherous bottom, the pale bog-violets grew; and the sweet-gale, smelling like myrtle, had put out its little resin-scented cones. Bird-voices were so numerous that it was difficult to identify any one in particular; but we could pick out the blackcap's clear flute-like notes. There was much to see, too, by the water's edge. A host of newly-arrived sedge-warblers chattered amongst the reeds, which hid many a coot's nest with its stone-coloured, ink-speckled eggs, to give place in a month's time to families of black downy youngsters. They are active little creatures, following their parents out amongst the water-lily leaves and snapping up many a gauze-winged fly. Only a small proportion of those hatched seem to reach maturity. We fancy the big pike, which on a warm day lie near inshore, and dart out through the reeds with a swish as we pass, must account for a good many. Probably the dabchicks and moorhens would also breed here, but for the liability which their unfledged nestlings run of being snapped up by these greedy tyrants of the pool.

The reeds are hardly above the water before the 1st of June; but so rapid is their growth that by the end of the month they are high enough to hide us completely as we wade through them. Now is the time to find the reed-warblers' nests, cunningly suspended between their fluted stems, sometimes by attachment to two stalks only, while at other times three or four are interwoven so as to support the deep cup-shaped structure, beautifully fashioned of the flower of the reed. In this hanging cradle we find the four greenish, darkly-spotted eggs; or, later on, the nestlings, which leave the nest before they are fully fledged, and, by the aid of their strong claws, climb about among the reed-stems. Very noisy and anxious are the old birds, scolding and shrieking at us almost at arm's-length; and bursting exultingly into song—a strange jumbled sort of chatter, delivered *sotto voce* and in the most hurried manner—as we pass on.

Midsummer comes and the year is in its prime. Tall spikes of foxglove have taken the place of the bluebells and orchis; purple loosestrife and yellow iris brighten the wet spots where, earlier on, the marsh-marigolds flowered; and the air is heavy with the scent of the elder-blossom. Honeysuckle and dog-roses are in the hedges; and the first hay is being carried. The hares, once so plain to be seen, are now all but hidden; we can just catch sight of their long

ears amongst the waving heads of the grasses. The mere never looked better; though it makes a fair enough picture in the calm October days while the woods are still leafy and in all their glory of autumnal colouring. Another of its aspects has been described to us, when it is all one sheet of smoothest ice, ringing under the lightsome glide of skates; but it is not every winter which brings a frost of sufficient strength to freeze so large a pool.

Still we are fond of the mere in all its moods; and good it is, as one after another of Nature's outposts is improved into dull and joyless commonplace, to know that she has a stronghold so near where the birds and the flowers still have it all their own way.

DUMARESQ'S DAUGHTER.

CHAPTER XXXI.—A NILE TOURIST.

SOMEWHERE about the same time when these things were passing at Algiers, the Reverend Francis Austen Linnell, Vicar of Hambledon-cum-Thornylough, Northumberland, sat with his legs dangling over a huge block of sculptured sandstone, among the massive ruins of the vast and many-chambered temple of Rameses the Great by the quay at Luxor.

The Reverend Francis Austen Linnell, to say the truth, was in a gloomy humour. He revenged himself upon the world, indeed, by hammering with his stick at the crumbling figures of Khem and Isis that covered the huge sandstone block on whose top he was seated. Time and invaders had gently spared those sculptured forms for six thousand years: the Persian, the Greek, the Roman, and the Arab had all swept over the land, and let them go by unhurt: but the Reverend Francis Austen Linnell, with his iron-shod stick, took a malicious pleasure now, like a veritable British tourist that he was, in defacing the nose of the gray goddess whom so many ages and so many conquerors had looked down upon without injury. Things had gone badly with the last of the Linnells on the Upper Nile. He had pushed as far up towards Wady Halfa as the courtesy of the military authorities would permit during those stormy times: he had questioned every real or supposed refugee from Khartoum whom he could find anywhere among the native bazaars; but he had elicited nothing of the slightest importance about his half-brother or his cousin. Their fate remained as absolutely doubtful as the fate of all the other defenders of the conquered city. Vague rumours and surmises there were plenty, to be sure, but of solid fact or certain assurance, not a single item.

So the Reverend Francis Austen Linnell had returned to Luxor in a very ill humour, and had left his dahabeah now moored close under the bank by the Karnak Hotel, while he himself sat disconsolate and alone, chipping bits from the bas-reliefs, among the ruins of the temple.

To be sure, there was some hope of news still; for a strange report went about at Luxor that day. A European refugee, it was rumoured

—a newspaper correspondent or somebody of the sort, who had remained in Khartoum up to the very last moment—had yesterday arrived across the desert at Assouan. Now, if this European refugee turned out a reality, there might still be some chance of learning Sir Austen's fate from a presentable witness. So the Reverend Frank sat and gazed around with a somewhat contemptuous glance at the mass of dust and dirt and rubbish that encumbers the base of that gigantic ruin, and waited impatiently for the expected traveller.

Of course Frank Linnell was not alone. Nobody is ever alone for ten seconds in Egypt. The custom of the country does not permit solitude. A crowd of pestering little native boys, picturesquely arrayed in torn and ragged commissariat corn-sacks, with flies clustering thickly on their bleared eyes, held out their tawny hands, and showed their hideous artificial sores, and clamoured for backshish with true Egyptian persistence. The Reverend Frank regarded them cynically. 'No backshish,' he answered in an angry tone, threatening them with his stick, and laying about him roundly over their naked shoulders. 'Not one penny of backshish will any one of you get from me to-day. Go along, I say. Don't want you here. Leave me alone, can't you?'

The boys fell back for a moment, still crying 'Backshish, backshish!' and regarded the stranger with a suspicious glance. Frank Linnell rose, and strolled idly towards another part of the building. The boys followed him through the deep dust, hustling him as he went with genuine Oriental eagerness. 'Rameses! You want see Rameses? Me very good guide! Me show you Rameses!' they cried in chorus in their broken English, dancing before Frank Linnell's footsteps, raising clouds of dust as they went, and leading the way triumphantly towards the great colossal seated statue. 'Me want no backshish,' one of them insinuated coaxingly with a persuasive air. 'Want to show English gentleman de way. Me very good boy. Dis way for see Rameses, and no backshish.'

Frank Linnell was a hasty-tempered man, and he was also gifted with the common British incapacity for grasping the idea that anybody else should be unable to comprehend his own language, if quite distinctly, articulately, and loudly spoken. So he paused on his march for a second, and leaned his back impressively against the base of one of Amenhotep's great sculptured pylons in the central temple. 'Now, you look here, you boys,' he observed with dignity, in his most didactic tone, holding up one warning forefinger, as if he were addressing his own national school at Hambledon-cum-Thornylough in the county of Northumberland: 'I've seen Rameses the Great fifty times already, in every possible form, shape, and material—sitting and standing, fighting and feasting, on foot or in his chariot, life-size or colossal—till I'm sick and tired of him. I don't want to see Rameses the Great again in any place, position, dress, or fashion, as long as I live; and I hope to goodness I may never more set eyes upon him anywhere. I don't like Rameses—do you understand?—I object to Rameses: I disapprove of Rameses: and I don't care for antiquities. I

came out here in this precious temple this morning to try and get a little peace and quiet, not to be bothered with boys and colossal statues. And if any one of you fellows comes one step nearer me—he drew a line in the dust with his stick as he spoke—“if any one of you fellows dares to step one inch across that line, all I can say is,” lifting his stick suggestively in the precise attitude of the Pharaonic hero—“I’ll give him Rameses across his back and shoulders before he’s another ten minutes older.”

The boys listened gravely to every word of this succinct address, and then, seizing with avidity upon the one word of the whole which they really understood, vociferated once more in chorus: ‘Yes, sah: Rameses, sah: me very good guide: me show you Rameses: dis way, sah, for Rameses de Great: dis way to Rameses.’

The parson from Northumberland poised himself firmly against the half-buried propylon, and resigned himself to a comical look of despair at the little brown ragamuffins, who still held out their eight or ten hands persistently for backshish. As he stood there, the very picture of the baffled Briton in the midst of his foes, whose light infantry proved far too nimble for his heavy guns to disperse, an Arab, as he thought, approached by the door from the opposite direction, and walked straight up to him, with outstretched hand, as if bent on entering into conversation with the usual practical object of obtaining backshish.

The new-comer was dressed in semi-European clothes, with an old red fez stuck jauntily on his head, as is the fashion with temple guardians and other such minor hangers-on of the Egyptian government. Frank Linnell immediately suspected another attempt to rob him of a fee, under pretence of asking for the official permit to visit the antiquities of Upper Egypt; so he waved the stranger aside impatiently with his warning hand, and observed once more very loudly in his native tongue—the only one he could use with fluency—“No backshish: no backshish: I’ve been here before. I’ve feed every precious soul—man, woman, or child—connected in any way with the management of this temple; and not a piastre more will one of you get out of me. Not a piastre more. Understand. Not a solitary piastre.”

To his great surprise, the stranger, instead of bowing low and retreating politely, smiled a benign smile, and answered in English of an unexpectedly flowing yet distinctly Hibernian character: ‘Ye’re mistakent, Mr Linnell.—It’s Mr Linnell I have the pleasure of addressing, isn’t it?—Ah, yes; I thought so. They told me at the hotel a clergyman of yer name had been asking when I’d be likely coming down the river; so I thought I’d just step out at once and see if I could find ye.’

Frank Linnell gave a sudden start of astonishment. Could this be the refugee? ‘You’re not the correspondent they spoke of, who’s escaped from Khartoum, surely?’ he cried in some excitement.

The stranger nodded a courteous assent. ‘Me name’s Considine,’ he answered with conscious pride: ‘one of the fighting Considines of County Cavan. I was correspondent at Khartoum for the *Daily Telephone*.—Ah, ye may well stare, sirr,

for it’s a narrow squeak indeed I’ve had of it. When the city was taken, those nigger fellows of the Mahdi’s, they just chopped me up piece-meal into small fragments; and as I lay there on the ground, in sections, near the Bourré Gate, thinking of me poor old mother in Ireland, “Considine, me boy,” says I to meself, or as much as was left of me, “diamond cement’ll never be able to stick ye completely together again.” But somehow, they dovetailed the bits after all, and took me into the hospital; and I pulled through, by the kind offices of some Soudanese ladies who were good enough to adopt me: and here I am, sirr, a miserable wreck as far as legs and arms go—why, those heathen hacked me to pieces so that ye couldn’t lay a sixpence between the scars on me body, I give ye me word for it—but ready to go the world’s end to help a fellow-countryman in distress, or a lady who stands in need of assistance.—Well, sirr, I’m glad to meet ye, and to make yer acquaintance, for I knew yer brother, and I can give ye later news of him than ye’ll get in the newspapers.’

The Reverend Frank drew himself up on his dignity, a little stiffly. ‘Sir Austen Linnell was my cousin, not my brother,’ he answered with official vagueness, for he could never quite bring himself to acknowledge the existence of the actress-woman’s son, who had deprived him of his birthright.

‘Tut, tut, tut, man,’ the correspondent answered, not without a faint tinge of wholesome contempt in his tone. ‘I knew them both—yer cousin and yer brother—and a finer man or a braver than Charles Linnell, whom ye want to disown, I never set eyes on. Sure, ye needn’t be ashamed of him.’ And seating himself on the broken pillar by the clergyman’s side, Considine began to narrate in full, with much Irish spirit, and many graphic details, the whole story of the siege, and his own almost miraculous escape from Khartoum.

‘But what ye’ll be wanting to know most,’ he said at last, after he’d dilated at some length upon the fragmentary condition in which the Mahdi’s troops had left his various limbs on the ground at Khartoum, and the gradual way in which ‘the chips had been picked up and welded together again,’ as with some pardonable exaggeration he phrased it—‘what ye’ll be wanting to know is how yer brother came out of all this trouble.’

‘Did he come out of it at all?’ the Reverend Frank inquired, with a little undercurrent of tremulousness in his anxious tone. ‘Or Sir Austen either? Have you any accurate information about their fate to give me?’

‘Accurate information, is it? Well, it isn’t just the moment for observing accurately, ye must own yerself, when ye’re lying about loose in pieces, waiting for somebody to pick ye up and put ye together again,’ Considine retorted gaily. ‘But all I can tell ye is this: on the morning when the niggers broke like ants into Khartoum, yer cousin and yer brother were both alive: and if I got away, why shouldn’t they too? They were as clever as I was.’

‘It’s very improbable,’ Mr Frank Linnell replied incredulously, yet much disconcerted. ‘They were both reported “most likely dead” in the newspaper despatches.’

'Were they so, now?' Considine echoed with profound interest.

'Yes. Stragglers and refugees even said their bodies had been identified near the Bourré Gate.'

Considine looked up with a smile of relief. 'They did, did they? Then ye may take it for granted,' he answered, in a tone of profound conviction, 'that they're both this minute alive and kicking.'

'Why so?' the parson asked with a thrill of unpleasant surprise. Family affection didn't prompt him to desire the escape of either of his two respected relations.

'Why, have ye never observed,' Considine answered with great good-humour, and the demonstrative air of a mathematician proving a theorem, 'that whatever's put in the newspapers about anybody ye know yerself is as sure as fate to be utterly mistaken? I'm a newspaper man meself, and I ought to be an unprejudiced observer of journalism. Take yer own case, now. Weren't ye kilt in a railway accident? Didn't the newspapers report ye entirely dead? Well, and when I went to the hotel just now, they told me ye were here. "Impossible," says I; "the man's kilt long ago."—"But he came to life again," says the hotel-keeper: "it was only a railway accident."—"To be sure," says I. "How stupid of me not to have thought of that before. I might have known he was alive—for didn't I see his death meself in the newspaper?"'

'Such cases must be very rare,' Mr Frank Linnell responded with British caution.

'Rare, is it, sirr?' the correspondent echoed hastily. 'Well, then, take me own case again. Wasn't I kilt in Afghanistan, as the *Times* itself announced: and didn't I turn up for all that six months later at Quetta? Wasn't I kilt with Stanley on the Upper Congo: and didn't we all come out again, after all, alive and well, at Zanzibar? Wasn't I kilt in Khartoum the other day, and cut up into sausage-meat for the use of the commissariat: and amn't I on me way down to Cairo now, to offer me services and the remains of me body to me own government for future expeditions? No, no, sirr; depend upon it, if ever a man's kilt in the newspapers, as sure as fate, it's a very good symptom. Why do I give Gordon up, though there are some that think he's living still? Why, just because the newspapers were afraid to kill him. And why do I believe yer brother's alive, and yer cousin too? Why, just because the newspapers, without one quaim of doubt, have got rid of them altogether.'

'But you say you were in Khartoum for three months after its fall,' Frank Linnell objected. 'Did you ever hear or see anything of either of my real or supposed relations?'

'And d'ye think we went paying calls and leaving pasteboards in Khartoum, after the Mahdi's people came!' Considine retorted contemptuously. 'Why, sirr, till the night I stole away with a small body of natives going north on duty, I never dared to show me nose outside me own quarters, where the Soudanese ladies I told ye of were kindly taking care of me—for I flatter meself I always got on with the ladies. But one thing I can tell ye, and that's certain.'

He dropped his voice to a confidential whisper. 'At Dongola I met a water-carrier who'd been in Khartoum to the end, and he recognised me at once when he saw me in the bazaar. And he told me he'd observed a white man, disguised as an Indian Mussulman, in Khartoum town a month after the capture, whose description exactly answered to yer brother's. At the time I thought he must be mistaken; for I saw Linnell cut down, meself, in the great square: but now ye tell me the newspapers have kilt him, I'd stake me reputation it was Charlie Linnell the fellow saw, and that ye'll welcome him home yet some day at yer parsonage in England.'

THE GREAT SEAL.

Seal then, and all is done.

Antony and Cleopatra.

THE use of a seal, by which the Royal Will is signified, to public documents is of somewhat ancient origin. The Romans had no such seals; thus, their edicts went forth to the world unattested by these appendages. The earliest example of the use of a public seal in England is afforded in Offa, king of Mercia, who appears to have made occasional use of one during his reign, extending from 757 to 796. Owing to the art of writing being little known, seals from this period appear to have come into common use, and hence the king, in common with the fashion of the age, adopted a seal—styled 'The Great Seal'—with which grants and writs were signed. It is, however, to King Edgar that the regular use of a public Seal is assigned, although for many years it was generally supposed that Edward the Confessor was the first English sovereign to bring one into common use. In those early times, an officer designated the 'Chancellor' or the 'King's Chancellor' was generally entrusted with its care; but occasionally—says Campbell, in his *Lives of the Lord Chancellors*—the duties were delegated to a Vice-chancellor; and at times, when the appointment of Chancellor became vacant, the Seal, instead of remaining in the personal custody of the sovereign, was more often consigned to the care of a temporary keeper. At length the practice grew of appointing a person to hold the seal under the title of 'Keeper.' In Queen Elizabeth's reign, a statute was passed which directed that the 'Keeper of the Great Seal' was henceforth to have the same place, pre-eminence, and jurisdiction as the Lord Chancellor, thus combining the two offices. But it was not until the reign of George III. that the old and familiar title of 'Lord Keeper of the Great Seal' fell into abeyance; thus, since that time the holder of the Seal has borne the single title of Lord Chancellor.

It is not uninteresting to learn that, amongst the many Lord Keepers, history records one instance of a lady having the care of the Seal, and that Queen Eleanor, wife of Henry III., who was appointed 'Lady Keeper' during the king's absence in France.

Without the royal permission the Seal may not be taken out of the kingdom; and the only instance in which this authority has been set

at defiance is that when Cardinal Wolsey carried the Seal with him into Flanders, an act which formed one of the charges for which he was subsequently impeached.

Curious records are extant of the appointments and emoluments in connection with the office of the Great Seal in the sixteenth and seventeenth centuries. Thus, there was the Clerk of the Hanaper—so called, it is said, because all writs, grants, &c., were formerly kept in a *hamper*—whose duties were to attend the Keeper of the Seal and take account of all patents, grants, commissions, &c. sealed. The fees attached to this office are somewhat quaint; as, for instance: 'For his ancient wage of 6d. per day of 365 days, £9, 2s. 6d. For the wages of a boy under him to keep the horse that carries the wax and parchment for the rolls at 4½d. per day, £6, 16s. 10½d. For 16 yards of woollen cloth at 8s. a yard, to use about the Great Seal at time of using, £6, 8s. Livery for Deputy Clerk of the Hanaper, 13s. 4d. Livery for boy, 6s. 8d. For Winter Livery against Xmas, £1. For Livery against Whitsun, £1. For bags to carry writs, £2. For charges and expenses of himself and deputy for riding, serving, and waiting upon the "Lord Keeper," at 1s. 6d. per day, £27, 7s. 6d.;' and other minor items.

Besides this important officer, there was one styled 'Chaffwax in Chancery,' whose duties consisted in finding the various kinds of wax necessary for the sealing, and in attending the sealings. In addition there was a Sealer, and also a Purse-bearer—an office which we are told had its origin as far back as the reign of Edward III. The duties of this latter officer consisted in carrying the Seal, contained, as it is in the present day, in a purse, and to take care that no document passed under the Seal without proper warrant. It is satisfactory to know that in this nineteenth century most of these offices of sinecure are now abolished.

The earliest Seals appear never to have exceeded the size of three inches in diameter, reaching four and a half inches in the reign of King Edward III.; and since that time they have gradually increased in size, until the diameter of the present Seal in use is now a little over six inches. Most of the sovereigns have had more than one Seal during their reign, Edward III. and Edward IV. having had five, a number which George III. equalled.

One learns little from history of the Great Seal until the period of the Commonwealth is reached. The parliamentary records of that time make constant reference to the subject. In 1643, while the Civil War was in progress, the subject of a new Seal was one of much debate; it being finally resolved—so runs the record—'that Mr Simons be required and enjoined forthwith to make a new Great Seal of England similar to the last, and that he shall have £100 for his pains—£40 in hand, and threescore pounds as soon as he shall have finished his work.'

In 1646, we are told that, in order that there should not be rival Seals, the one in use previous to 1643 was taken to Oxford, where Parliament was sitting, and with great solemnity it was there broken in pieces in the presence of both Houses. But two years elapsed when, Charles I. having meanwhile surrendered himself to the

Scots, by resolution of the House, a fresh Seal of new design was put into use. On one side was depicted a map of Ireland, Jersey, and Guernsey, the arms of England and Ireland, and the inscription, 'The Great Seal of England, 1648;' while on the other side was a representation of a sitting of the House of Commons with the Speaker in the chair. The former Seal having been surrendered, the journals state that a smith was sent for, who entered the House and broke the Seal before the Speaker: the fragments and the purse, having the royal arms embroidered upon it, being given to the 'Lords Commissioners'—as the custodians of the Seal were called during that period—for their fees.

On the accession of Charles II. another new Seal having been made, the Great Seal of the Commonwealth was dealt with as was the Seal of his royal father, the pieces being likewise delivered to the 'Lords Commissioners' for their fees. A curious episode is stated to have occurred in relation to the Seal of this Merry Monarch. It would seem that while in exile he had a Seal prepared for him, which he carried with him into Scotland, when he was crowned there; but at the battle of Worcester he had the misfortune to lose it; and as it was never discovered, his commands were given for the making of a new one.

The Seal of James II. has perhaps the most historical interest attaching to it of any. The king learning of the landing of Prince William of Orange, took much alarm on hearing how closely he was approaching the capital; and thinking, no doubt, to embarrass the Government if they attempted to carry on the affairs of the nation without him, sent to Jeffreys the Lord Chancellor directing him to surrender the Great Seal. On receiving it, the king, on the night of December 10, 1688, accompanied by Sir Edward Hales, stole out in disguise from the palace at Whitehall, carrying the Seal with him; and getting into a boat at Westminster, directed the waterman to pull to Lambeth. On the journey, the king silently slipped the Seal into the river, thinking, no doubt, that he had sunk with it the fortunes of the Prince of Orange. Notwithstanding the loss of the Seal, history records the progress of the revolution, and of the Prince of Orange being, a few weeks later, made king. The historical Seal, a short time afterwards, was drawn up in his net by a fisherman, who, it is related, was much astonished with his find, which eventually reached the hands of the Lords of the Council.

In 1784, the kingdom was startled by the announcement that the Great Seal of England, which had been in use since 1760, had been stolen. The account given by Campbell states that while preparations were being made for dissolving parliament, news was received that on the night of the 24th of March thieves had broken into the house of the Lord Chancellor (Thurlow) in Great Ormond Street, then bordering on the country, and that amongst other things taken from the study was the Great Seal, enclosed in two bags. The thieves escaped with their booty, and although a reward was offered for their discovery, they eluded detection. The Lord Chancellor, on learning what had happened, immediately waited upon the king at Buckingham House

to communicate the intelligence to him; and a Council was then summoned, at which an order was issued for a new Seal. A charge was brought against the Whigs that, in order to prevent the dissolution, they had burglariously broken into the Lord Chancellor's house and feloniously stolen and carried off the Seal. The subject was one that caused a good many witticisms in the journals of the day; the *Rolliad* alluding to the subject in the following lines:

The rugged Thurlow, who, with sullen scowl,
In surly mood at friend and foe will growl,
Of proud prerogative the stern support,
Defends the entrance of great George's court
'Gainst factious Whigs, lest they, who stole the Seal,
The sacred diadem itself should steal;
So have I seen, near village butcher's stall
(If things so great may be compared with small),
A mastiff guarding on a market day
With snarling vigilance his master's tray.

Disputes have sometimes arisen as to who should be the possessor of the disused Seal. Such was the matter of a dispute between Lord Lyndhurst and Lord Brougham. On the accession of William IV. a new Seal was ordered to be prepared, Lord Lyndhurst being at the time Lord Chancellor. By the time the Seal was finished and the order given for using it, Lord Brougham had succeeded to the office. Lord Lyndhurst claimed the old Great Seal on the ground that the transaction referred back to the date of the first order, and that the fruit must therefore be considered as having fallen in his time; while, on the other hand, Lord Brougham insisted that the point of time to be regarded was when the old Great Seal ceased to be the *clavis regni*. The matter being submitted to the king, as supreme judge in such cases, His Majesty equitably adjudged that the old Seal should be divided between the two noble and learned litigants; and, as it consisted of two parts for making an impression, one representing the sovereign on the throne, and the other on horseback, the destiny of the two parts respectively should be determined by lot. His Majesty's judgment, it is said, was much approved; and he graciously ordered each part of the Seal to be set in a splendid silver salver, with appropriate devices and ornaments, which he presented to the two disputants as a mark of his personal respect for them.

Two *bons-mots* ascribed to Lord Erskine show the ready wit of that famous but short-lived Lord Chancellor. He was asked by the Secretary to the Treasury whether he would attend the Ministerial fish dinner to be given at Greenwich at the end of the session; to which Lord Erskine replied: 'To be sure I will: what would your fish dinner be without the Great Seal?' Again, after resigning the office of Lord Chancellor, which he held for about a year, Lord Erskine was present at a dinner-party at which Captain Parry the great explorer was a guest. The explorer was asked what he and his crew had lived upon when they were frozen up in the Polar seas, to which Parry replied that 'they had lived upon seals.' 'And very good living, too,' exclaimed the ex-chancellor, 'if you only keep them long enough.'

It may be of interest to know that the Great Seals have mostly been made of silver, although

they have sometimes been made of gold or baser metal. The wax used in the actual sealing of documents has been of various colours—red, green, white, yellow, brown, and chocolate having from time to time been used. The cords which run through the wax impression are of silver for very important documents, silken for those of lesser importance, and woollen for the common run of documents. The Seal is furnished with a richly embroidered purse, in which it is carried before the Lord Chancellor when he appears in state. This purse is renewed every year, and is a perquisite of that high functionary: thus, if the office of Lord Chancellor is held for any length of time, the purses accumulate, as in the case of Lord Eldon, who, it is said, had so many that his wife caused the hangings of her bed to be made with them.

A few words as to the Seals of the present reign will bring our subject to a close. Up to the present, but three Seals have been in use, each of identical design. The first, which came into use at Her Majesty's accession, bears on one side a figure of Her Majesty in state robes on horseback, wearing on her head the royal crown; while the counter-seal shows a figure of the Queen in her coronation robes, seated on the throne. In the year 1860, it was found necessary that a similar Seal should be made; and again in 1878. In that year, an Act was passed which directed that many of the documents hitherto passed under the Great Seal should for the future be passed under a smaller Seal, styled the Wafer Great Seal. Hence, the use of the Great Seal proper is now restricted to documents of high importance, such as treaties with foreign Governments, &c.

It was thought in official quarters that at the time of the Jubilee Her Majesty would probably have commanded a new Seal to be designed, with a representation of her figure similar to that on the new coinage; but no such commands having been forthcoming, it may be hoped that now many years will elapse before it may become necessary for a new design of the Great Seal of England.

THE ROMANCE OF A SUMMER.

CHAPTER II.

THAT same evening, as aunt and niece were seated in the little room which served as dining-room and drawing-room both, they saw the well-known figure of the village postman stopping before their little gate.

'Run, Avice, dear, and see what letters old David has for us,' said Miss Marchmont, looking round at her niece. 'We ought to have one from grandmamma to-day, it is so long since she has written.'

Avice needed no second bidding, and in another moment she was standing by the old postman's side. 'Now, David,' she said coaxingly, 'where are those letters you promised me yesterday? I'm getting fearfully impatient for them.'

David shook his head. 'I'm fearing there's naething for ye the nicht, missie,' he replied, as he held open his scantily-filled bag for her inspection. 'But here's twa for the auld leddy yonder.'

nodding his head in the direction of the window as he spoke, and at the same time producing two square-looking packets from the bottom of his bag. 'Maybe there's some bit letter inside for you.'

Avice shook her head doubtfully; there was not much likelihood of that, she thought, as she returned to the sitting-room with them. 'Two for you, auntie,' she said, as she handed them to her. 'One's from grandmamma, and the other's an Indian letter—from papa, I expect; it's like his writing.'

If she had wanted to know the contents of the last-named letter, she was doomed to disappointment, for Miss Marchmont, after glancing at the superscription, placed it in her pocket and turned her attention to the other one. Her brother-in-law's scrawls were not easy to read, and she preferred deciphering them by herself.

Presently, however, Avice, seeing the Standishes at the gate, went off to join them in their walk; and then pulling the Indian letter out of its resting-place, the elder lady proceeded to peruse it. Apparently the contents did not exactly please her, for her usually placid forehead wore a decided frown as she replaced it in its envelope, and an ejaculation which, coming from other lips, might have been termed impatient, escaped her. 'It's a great nuisance,' she murmured, half aloud, as she gazed abstractedly out of the window—'a great nuisance. If only he had waited until rather later—until October, say, or even the end of September! But to have him coming home just now, when mother and I are both away from home, and Erica too—it is really *too* provoking. However, he'll just have to come and stay down here, if he really wants to see us on business.—Ah, well, I just wish Margaret had never met him. Poor Margaret! it would have been better for her at any rate if she hadn't.' And then the good soul went off into a day-dream, a sad-sweet dream of days which could never return, when her long dead sister, Avice's mother, had been a laughing joyous girl, just as her daughter was now, in the bright careless days before she had met and loved Kilmur Sacharty.

The shadows were growing long and black ere she was roused from her reverie by her niece's merry laugh. She smiled as she watched the girl's deft fingers light the little lamp, 'to save Perkins the trouble;' and sighed, too, as she noted how like every gesture, every movement of the slim figure, was to that of the dead young mother.

'I have had a letter from your father,' she began at last after a few minutes' pause. This was merely by way of introduction, as Avice knew that much already. 'It is not very long, nor is there much in it, except the fact that he is on his way home—ahem, I should say to England, at this moment.'

'Papa coming home! Why, how's that, auntie? He hasn't been abroad more than four years since he was here last. What can be bringing him home?' And Avice turned a look of inquiry upon her aunt.

'That I cannot tell you, for I do not know myself,' returned that lady. 'He merely says it is a matter of business, which he can settle best personally. But you know how erratic his movements are.'

Avice looked puzzled, but not altogether

pleased. The truth was, she also wished her father's visit had been deferred till later, for she had no mind to quit Mark's Cove before the Standishes, and she feared that this might lead to her aunt's returning home at once. So she was not a little relieved to hear Miss Marchmont declare that she had no intention of going back, and that if Kilmur wanted to see them, he could just come down to Mark's Cove.

'That's another fulfilment of my prophecy,' said Avice, as she related the news to her ally Humphrey the next day—'at least, I mean a kind of fulfilment, for of course it is a very nice one, and I prophesied evil.'

Humphrey didn't answer. He appeared busily engrossed in baiting one of the girl's hooks—in reality, he was doubting whether the news were really so good—at least for him, for 'papa' might object to his suit, and shatter all his hopes with one cruel blow. However, it was no good meeting trouble half-way, as he told himself; so, casting all thoughts of parental opposition to the winds, he set to work to enjoy himself as heartily as if no such thing could possibly exist, and the next few days passed more swiftly than those before. Destiny, however, was bringing the much-dreaded father nearer and nearer, until at last one fine day it landed him outside the little green door of Miss Marchmont's rooms, and gave him a friendly push over the threshold.

Humphrey was out when he arrived—by himself, for a wonder—the fact being that he had gone out in a herring-boat, 'just to see what it was like,' as he said; and he did not return until about eight o'clock the next morning.

Mrs Standish told him the news over his breakfast, and also added that she had been introduced to the new-comer.

'Oh! And what is he like?' inquired Humphrey, diligently buttering his bread, as if Kilmur Sacharty's appearance was no more to him than that of the sweep. 'Is he good-looking?'

'Um—yes. I suppose he would be considered rather handsome. But, my dear Humphrey,' in an expressive whisper, 'he is *black*.'

'*Black*!' almost shouted her son, springing out of his seat in astonishment. 'Do you mean to say that Avice Sacharty's father is black?'

Mrs Standish looked a little surprised. She had certainly not expected such an exhibition of feeling, although she guessed that her news would be rather startling.

'Of course, he is not like a nigger, my dear,' she said mildly. 'He is an Indian—but I'm not sure, as it is in Malacca he lives—a man of great influence, and of very high rank there, I believe. And he is not *very* black, not very much more so than Avice herself; and you know she is not particularly dark.'

Humphrey frowned. However noble and powerful the father might be, the idea of a coloured father-in-law was not exactly a pleasant one, even though the tinting were light. But still, as he reflected, intermarriage with foreign potentates and nobles was not considered such a very dreadful thing nowadays. In fact, it was done, well, if not every day, at least sometimes. And then there was Avice herself, so sweet and bright and lovable, with her winsome face, which had learned to brighten at his coming, and her

merry laugh, which rang in his ears like music. Surely, if she loved him, it was worth while submitting to some little disagreeables for her sake. And as he thought it all over, the recollection flashed over him of how that bright face had looked in its deathly pallor that day on the cliffs, when he all but lost her ere she was won; and he shuddered again at the remembrance, and felt firmly and clearly how impossible it would be for him to relinquish her, come what might.

And after all, when he was introduced to Mr Sacharty, he found that—to look on, at all events—he was not at all so bad as he had imagined. Dark he most certainly was, but exceedingly handsome notwithstanding, with clear-cut features, a thin composed-looking mouth, and glossy hair the colour of Avicé's, which waved slightly and most becomingly.

He professed himself charmed to meet his precious daughter's preserver, for as such he most assuredly regarded Humphrey, and offered no obstacle to the free unrestrained intercourse which had all along existed between the two. To be sure, he often made one of the party when Humphrey proposed any ramble or excursion for himself and Avicé; but the astute young man early discovered Mr Sacharty's objection to the motion of the sea, and accordingly increased the number of his aquatic expeditions, much to Avicé's secret joy, for she loved boating beyond everything.

So far there had been no mention of the 'business,' the grave importance of which had brought him to England, and Miss Marchmont was beginning to think of making some inquiries as to its nature, when, to her relief, her brother-in-law started the subject himself. They were alone. Miss Marchmont was sitting by the open window busily engaged in embroidering a pinafore for a little niece in Ireland, when Kilmur suddenly drew up his chair opposite hers and said quietly: 'Amelia, I want to have a little talk with you about the business which has brought me over here, and it seems to me that just now is a very good opportunity for doing so.'

'Well,' returned his sister-in-law, laying down her work, 'I am glad that you have started the subject; for I was beginning to have some very serious doubts as to the existence of any business whatever.'

The Indian smiled—an unpleasant smile. 'Oh yes, it is very real business,' he replied—'very real, I assure you. It is about Avicé's marriage.'

Miss Marchmont started. 'Avicé's marriage,' she repeated, a nameless dread striking cold at her heart. 'Why, she is not even engaged. What is the use of talking about marriage for a child like that?'

'Her mother was exactly the same age when she married me,' replied the other, in his cold measured tones—'exactly the same age, if I remember right; besides, what has age to do with the matter?'

'She cannot choose for herself; she is too young to know her own mind,' began Miss Marchmont; but her brother-in-law interrupted her.

'It is not a case of choosing for herself or of knowing her own mind,' he said quietly. 'It is I, her father, who have to choose; and I have chosen.'

'Good gracious, Kilmur, what do you mean?' Miss Marchmont was not given to the use of ejaculations, but the violence of her emotions forced this one from her.

'I mean precisely what I say,' was the answer. 'I have exercised my parental right in choosing my daughter's husband, and he is one of the richest men in all the Malay Peninsula.'

'And his name?' gasped Miss Marchmont.

'The Rajah Mutwaneé,' returned her brother-in-law triumphantly; 'and he has promised to make her his principal wife.'

'His principal wife! The principal wife—temporarily, of course—of a Malay rajah.'

All Miss Marchmont's ideas of right and honour rose in arms at such a thought. Her brother-in-law must have taken leave of his senses, and she would take upon herself the duty of setting him right. Possessed of a considerable flow of language, she took him severely to task there and then, and poured out the vials of her wrath upon him. But he did not mind. He shrugged his shoulders a little, and then sat patiently waiting, a smile on his thin lips, until such time as her eloquence should be exhausted.

At last she stopped, more from want of breath than from lack of argument; and then he repeated, politely but firmly, his former declaration, that he, as the girl's father, had complete authority over her in all matters whatsoever.

Miss Marchmont was momentarily dumfounded by his coolness. Only momentarily, however, for suddenly bending forward in her chair, the light of triumph in her eyes, she exclaimed: 'Kilmur Sacharty, you have no such authority. You renounced it entirely on her mother's death.—No!' as he opened his lips as if to reply; 'you need not trouble to deny the fact, for I have your formal renunciation in black and white at the lawyer's, and by that paper her grandmother and myself are appointed Avicé's guardians.'

An angry gleam flashed in the dark eyes of the foreigner. 'That paper is not binding,' he cried fiercely. 'In my own land, among my own people, I can snap my fingers at your musty lawyers and their foolish decrees, fit only for the control of slow-blooded Englishmen. We in Malacca do not acknowledge such papers; we do not hold that faith should be kept with infidels.'

A scornful smile curled round the corners of the spinster's lip as he said this. 'You talk foolishly, Kilmur,' she said, rising. 'When you come to think the matter over, you will see that I am right.'

Apparently, Miss Marchmont was right when she predicted that Kilmur Sacharty would think better of what he had said; for the next morning he waylaid her as she was going down to the beach and humbly apologised for his rash and foolish words. She was the more surprised at this, as she knew her brother-in-law to be a man of an intensely proud nature, and for a moment she was somewhat inclined to doubt his sincerity. However, his penitence, although somewhat theatrically expressed, seemed real enough; and after giving him a sharply-scrutinising glance, which he bore without flinching, she graciously accorded him the pardon he sought.

'Only I hope, Kilmur,' she added impressively,

'that you will never entertain such an outrageous idea again. Remember Aviee is not in the slightest degree answerable to you, nor have you any power over her.' With which warning speech she passed on down to the beach, leaving Kilmur to digest her words at his leisure. Had she seen the look of hatred which passed over her brother-in-law's face as she turned away, she might not have felt so comfortable as she did; but she was thinking of other things, and she did not notice him.

The truth was she had remarked for some time past Humphrey's growing attachment for Aviee, and her mind was occupied with the problem, did the girl return his affection, or were her feelings towards him merely those of friendship? She could not tell. Girls were queer creatures, and Aviee in some things was one of the queerest. The only way in which her aunt could judge was by watching her closely when with Humphrey; and even then, as she acknowledged with a sigh, it was very hard to tell.

Matters were in this state when one morning she received a letter from her sister in Ireland begging her to come over and help her, as her youngest child was dangerously ill with scarlet fever, and the two elder ones seemed to be sickening of the same fell complaint. She had scarcely finished reading her sister's mournful epistle, written in pencil by the sick child's side, when Kilmur, who was also engaged in perusing his correspondence, glanced up.

'Can you tell me when the next train goes to London?' he inquired. 'I find I must go at once to Berlin. I have some business there which requires my immediate attention, and I must go to London first.'

A feeling of relief came over Miss Marchmont's heart. If Kilmur were away, she should not mind leaving Aviee in Scotland, to pay a long promised visit to some friends, while she herself went to Ireland.

'There is a train about eleven o'clock,' broke in Aviee's voice before her aunt had time to answer. 'You could catch that nicely, I should think.'

Evidently her father thought so too; and by five minutes past eleven he was slowly steaming out of the Mark's Cove station, leaving Aviee and her aunt to return home and make their own preparations for a speedy departure.

Humphrey pulled a decidedly long face when he heard of their change of plan; 'though,' as Aviee remarked, 'it only made two or three days' difference, after all, Miss Marchmont having all along intended leaving on the first.'

'And to-morrow will be the twenty-eighth,' added the girl by way of consolation.

'Are you really leaving to-morrow, then?' queried Humphrey anxiously. 'So soon as that?'

They were standing by the little green gate, the afternoon sun glinting full upon them when he spoke, and in the soft light Aviee looked more beautiful than ever. The thought of parting from her even for a short time was a painful one.

'Yes, really and truly to-morrow,' she replied, absently pulling off the petals of the crimson rose at her belt.

Was it fancy, or was there really a sad inflection in the bright voice as she spoke? He could

not say, but a sudden impulse made him ask hurriedly: 'Are you sorry to go, Miss Sacharty? Would you have liked to have stayed?'

Something in his tone startled her, and she drew a step or two back through the little gate as she replied: 'Sorry? Well, yes; I am sorry! It has all been so happy, and now it is at an end, and it can never come over again.'

Humphrey looked at her in surprise. 'What do you mean?' he inquired. 'What is it that can never come over again?'

'Why, the summer,' she returned, colouring slightly under his earnest gaze. 'Of course there will be other summers, but then no two are quite alike—do you think so? I always feel that at the end of summer. A year will pass, you see, before the next—and a year is a long time.'

Before Humphrey could reply, Miss Marchmont appeared in the doorway. 'Come in, Aviee, dear—I want your help,' she said, nodding kindly to Humphrey. 'We have a good deal to do,* you know, and Perkins has got one of her bad headaches, and can do nothing.'

Aviee turned away, not sorry for the interruption. Humphrey had looked so strange, she thought, and had evidently not understood her remarks about the summer.

That was the last opportunity Humphrey had of a private talk with her; for, as Miss Marchmont had said, there was plenty to do, and the girl herself left early the next morning. 'Good-bye!' she cried gaily, waving her hand to him as the train began to move. 'I daresay I shall see you soon again!' And then, as the little trio on the platform faded out of sight, she sank back among the cushions of the carriage and prepared to enjoy her book. But somehow or other, its contents failed to interest her. The story—one which she had long wished to read, and which Humphrey had pushed into her hands as he bade her good-bye—seemed for the time to have lost its charm. The words made no sense. Two or three times she read over the same passage, and every time Humphrey's face seemed to come between her and the print, until at last she was fain to declare herself beaten, and shut it up with a bang which considerably startled the elderly lady who was seated in the opposite corner.

Strath Carron, where she was going, was a small place, but a good deal frequented just at that season by visitors, who were attracted partly by the mildness of its climate, and partly by the picturesqueness of its scenery, which was extremely grand and mountainous. Her friends, Major Douglas and his wife, had gone there chiefly on account of the mineral waters, for which the place was celebrated, and they were staying in an hotel near the Well.

'It is so much more convenient than staying in rooms,' Mrs Douglas explained as she led Aviee up-stairs on her arrival. 'One is saved all trouble and bother then.'

She was a pretty, delicate, little woman, of about two or three and thirty, of an easy-going temperament, which made her anything but a strict chaperon, as Aviee quickly found out. Indeed, her husband was much the best chaperon of the two, and had he been there all the time, it would have been better for Aviee. But the day after her arrival he went off to Perthshire

for some shooting, and the girl was left practically to her own devices.

She had been there about a week, or perhaps a little longer, when one morning coming in to lunch she noticed a fresh face at the long dining-table. The new-comer was a dark handsome man of about forty, clean shaven, and so dark in hue that she immediately decided that he must be, if not wholly coloured, at anyrate half-caste.

'Who is he, Mrs Douglas, do you know?' she inquired, gazing curiously at the apparently unconscious stranger; but though Mrs Douglas turned her gold-rimmed glasses full on the swarthy visage opposite, she could not say who or what he was. 'We shall learn his name by-and-by,' she returned carelessly; and Avic's curiosity remained for the time unsatisfied, and she dismissed him from her mind. Presently, however, she felt irresistibly impelled to look across the table at the stranger; and a curious undefinable feeling of uneasiness stole over her as she saw those keen black eyes fixed steadily upon her. She tried in vain to remove her eyes from his face. She looked at his neighbour, at the pot of heather which formed the central ornament of the table, and finally at her own plate; but wherever she looked, her glance seemed compelled to return to him. She gave a half-impatient shrug as she endeavoured to control her eyes, and a smile of satisfaction flitted momentarily over the dark face opposite. Lunch appeared that day an interminable affair, and Avic heaved a sigh of intense relief when at length it drew to a close and she followed Mrs Douglas from the room.

'How oppressive it was in there!' she exclaimed as they reached their own room. And indeed all lunch-time she had felt as if she were being stifled.

Mrs Douglas looked slightly astonished. 'Hot, do you mean?' she inquired, drawing on a pair of dainty driving-gloves. 'Why, my dear, I thought it quite cold. In fact, I made up my mind that a jacket would not be a bit too heavy driving this afternoon.'

'No; I don't mean that it was hot,' returned the girl. 'I mean—well, I can't quite explain; but it felt very horrid.' And she shivered slightly as she spoke, lying back in the easy-chair with evidently no intention of dressing.

Her friend was almost ready by this time. 'Aren't you coming out?' she asked with some surprise. 'We were going for a drive with Mrs Barfelt, you know.'

'Oh, to that place—what do you call it—that old castle near here? No; I don't think I'll come this afternoon. I've got rather a headache.'

Mrs Douglas looked quite distressed. 'What a pity!' she cried. 'Do change your mind, like a sensible girl, and come. You won't have the chance again, perhaps.'

But though she could not herself tell why she refused an excursion to which she had long been looking forward, Avic declined the invitation persistently.

'I've got rather a headache,' she repeated, 'and I should not enjoy it.'

So her friend was obliged reluctantly to depart, leaving her ensconced on the sofa with a novel and a bottle of lavender water by her side.

But less than an hour after Mrs Douglas had started she sallied forth, armed with the book and a rug, to a little glen at the back of the hotel. Why she chose that spot she could not have said, for it was not much frequented by the guests at the hotel, who usually scorned it on account of its nearness. Perhaps it was the cool green shadows of the glen which tempted Avic there that afternoon, or perhaps it was the tinkling music of the little burn which ran through it, and by the side of which she established herself, raising her eyes every now and then from her book to gaze into the clear depths of a pool in which were mirrored a thousand varying tints from the autumn trees above.

The time slipped slowly by, the silence unbroken save by the calls of the birds, the murmur of the brook, or the occasional rustle of some rabbit in the bushes, when all of a sudden, and without the slightest warning, she felt the same odd feeling of mental oppression which had so distressed her at lunch. Glancing up quickly, she saw the tall lithe form of the stranger standing before her.

IRRIGATION IN INDIA.

WHEN irrigation is spoken of in this country, it usually means the application to the soil of sewage. The necessity for running clean water over a field is hardly ever experienced; but in warm countries this is not the case. In countries like India, Persia, and China, the heat is so great, and the rainfall of the rainy season is so capricious, that artificial watering of the fields is required, if the certainty of a crop is to be looked for. In India, irrigation has been carried to great perfection. The water is obtained from canals, wells, and what are called tanks. These tanks or reservoirs are made by damming up the course of a river or stream at a suitable site. In the rainy season a large supply of water is thus stored up, to be used during the next summer. This source of water is but little used compared with that from canals and wells. There are no data to show what extent of land in India is watered from wells, but there is reason to believe that it exceeds that of either canals or tanks.

Canal irrigation existed before the advent of British rule in India. During the reigns of Akbar and Shah Jehan, in the more prosperous period of the Mogul dynasty, several canals for irrigation purposes were made. Indeed, one of the canals now existing, which takes its water from the river Jumna, is the reconstruction of a canal which was first excavated in the fourteenth century. During the last fifty years the government of India has done a great deal in the way of irrigation works, especially by constructing canals both in Northern and in Southern India. These are now, and, as time goes on, will be a still greater benefit to the country. It may be said of these canals that they are a permanent insurance against famine. They also employ a large number of native people, and, like the railways, they do

much to help on the improvement and civilisation of the country.

Before giving a short account of one of these canals, it may be advantageous to give a brief description of well-irrigation as carried on over all India, but especially in the more northern provinces. Nearly the whole of the great plain that embraces the country through which the river systems of the Indus and Ganges run, called the Indo-Gangetic plain, is alluvial in its formation, and water can always be obtained at no great depth from the surface. Indeed, an excavation carried no farther than ten or twelve feet will frequently gather as much water as will suffice for a limited plot of ground, such as a vegetable garden. Generally, however, the wells used for field-irrigation are constructed with care and at considerable expense—the principles of well-sinking being fully understood by the natives of India; and the shaft of each well is carefully lined with a cylinder of masonry.

The site chosen for the well is the highest point in the fields over which it is intended to run the water. But this difference in elevation is very slight in a country so level as the plains of India. To obtain a sufficient height for delivery of the water, it is generally necessary to raise the mouth of the well by surrounding it with a mound of earth, and the masonry cylinder is built up to the top of this mound.

The water is raised from these wells in large leathern buckets capable of holding ten to fifteen or even twenty gallons of water. Attached to the bucket is a rope, which passes over a grooved wheel or pulley, and its other end is fastened to the yoke of a pair of bullocks. These bullocks are driven down an inclined path or gangway, which, beginning at the top of the mound just mentioned, is continued into an excavation specially made for it. If the well is large and intended to water a good many fields, then a double gangway is made, so that two pairs of bullocks may be employed at the same time, one gangway for the downgoing, and the other for the upcoming bullocks. Each pair of bullocks has of course its own driver. A man is stationed at the top of the well, whose duty it is to overturn the buckets into a shallow enclosed space, from which the water flows into the irrigation channels, and is thus distributed over the fields. This distribution has also to be done by manual labour, men being employed to direct the stream over the several plots of land, all of which in turn receive thus a sufficient amount of water. This part of the irrigation process is the same whether the water comes from a well or from a canal.

Irrigation by means of canals is particularly suited to India on account of two of its geographical features. The first is, that at the time of the year when the water is most needed, the rivers in Northern India at least are very full, because the source of these rivers is the Himalayas, one of the longest and loftiest chains of snow-mountains

in the world; and during the intensely hot and dry weather in the months of April, May, and a part of June before the rainy season begins, the sun's heat is very great, and melts the snow on the mountains in enormous quantities; and thus the rivers are filled, not so full, it is true, as they are in the rains, yet containing a splendid supply of water for the crops at a time of the year when they would otherwise perish for want of it.

The second feature is that the land that has to be irrigated is an immense plain sloping gently towards the sea; so very gradual is this slope that it is sometimes difficult to get sufficient fall for the minor irrigation channels. In the main channels, however, the slope is too great; and to obviate the scouring action which a too rapid current would have, the gradient in the bed of the canal is made less by introducing falls at intervals. These falls are constructed of masonry, and they allow the water to make a sudden drop of from fifteen to twenty feet. In this way the too great slope is avoided.

It has just been mentioned that the rivers are full during the dry hot season. Nature thus by itself provides for the irrigation of the country; for a river like the Ganges has fertilised the land for many miles on either side of its course for centuries before a single canal had ever been made. But the water of a river can do far more fertilising work when distributed over the country by artificial channels; and to feed them, a parent canal is required.

Among all the irrigation canals of India there is none that has done so much for its agriculture as that known as the Ganges Canal. This large artificial river begins at Hardwar, in the north-west corner of the North-west Provinces, and ends at Cawnpore, running thus a distance of four hundred and forty-five miles. The notion of a canal in Great Britain is that of those used for navigation, in which the water is still; but in these irrigation canals the water flows like that in a river; yet there is this great difference between these canals and a river: the latter in its course becomes larger, by the contributions of its tributaries; while a canal on the contrary grows smaller as it performs its work of irrigation, so that in the case of the Ganges Canal by the time it reaches Cawnpore there is very little water left.

Hardwar, where the head-works of this canal are, is a very beautiful spot. It lies at the mouth of a wide gorge or valley at the foot of the Himalayas, down which the huge Ganges flows, and here it terminates its connection with the mountains, and begins its long course in the plains, running for nearly a thousand miles in a south-easterly direction to the Bay of Bengal. It is at this place that Sir Proby Cautley and the engineers associated with him determined to construct the dams required to force the water to enter the artificial channel which had previously been dug along the highest level in the country available for the purpose.

To effect this end, the channel for its first twenty miles had to be carried across the natural drainage of the country. In these twenty miles some very remarkable engineering works were

most successfully carried out. The canal was dug so as to run underneath two torrents, called the Ranipur Rao and the Pattri Rao; to cross and mingle its waters with a third, called the Ratmoo; and by a long aqueduct, including a masonry bridge of fifteen arches, it was taken over the fourth torrent, called the Solani. Thus was the water of the canal carried to the town of Roorkee, in the district of Saharunpore, the highest part of the great tract of land it was intended to irrigate.

When once the water had reached the highest level of the country, it was easy to make it flow over all the land that lay below it. This is done by means of distributories or artificial channels, known in India as *Rajbhas*, literally 'regal streams.' These are branched out into smaller channels, and these again into still smaller, and by these last the water is conveyed on to the fields. Before any of these minor channels are taken off, the canal has a width of one hundred and ninety feet, and carries a depth of ten feet of water when required, but between eight and nine feet is the usual depth. The amount of water flowing in the canal at any given time, or, as it is called, its 'discharge,' is constantly varying. It ranges between five to six thousand cubic feet per second. Some part of this water is lost by evaporation from the surface, and by percolation and leakage at sluices, bridges, &c. The evaporation in the dry hot weather sometimes amounts to half an inch in twenty-four hours.

It is not necessary to irrigate a field every day, even in the hottest weather. Moreover, some crops require more, and others less water. When, therefore, a group of fields has received sufficient water, the distributory leading to it is closed, and that leading to another group is opened. A regular rotation for carrying on irrigation is arranged between the canal officers and the villagers, and the latter are liable to be punished if they break through this rotation. In order to carry out these needful regulations, the government invests all canal officers with magisterial powers, so that they can try and dispose of all cases involving a breach of canal law. It is worth mentioning that in European countries where irrigation is extensively carried on, as in North Italy, Spain, and Southern France, it has also been found necessary to invest the canal officers with the powers of a magistrate.

It need hardly be said that the water in the canal does not cease running during the night. The cultivators therefore have to irrigate their fields during the dark hours, when it is their turn to do so; and it is during the night that offences against canal rules are often made, as, for instance, water is taken by a cultivator out of his proper turn, or even when he has no right to it at all. This necessitates the provision of a large number of watchmen or police, whose duty it is to prevent illegal irrigation, and also to bring to justice all offenders against the canal laws. It is to try cases of this kind that makes it needful to give magisterial powers to the higher grades of canal officers. All irrigated land pays a rate to the Government for the use of the water.

If land is irrigated, its fertility is assured; and

if the extent of land irrigated is considerable, it diminishes very much the risks of famine. As India is a country which has been periodically devastated by famines, the Government of India is fully justified in expending money in the making of irrigation canals. Experience has shown that private companies have not been successful in carrying out irrigation works, and the Government has therefore wisely kept them in its own hands. During the last twenty years a very large amount of capital has been sunk in canal works. (Up to 1883 the amount expended in the North-west Provinces alone was £6,890,769, and for this expenditure, between seven and eight million of acres have been brought under irrigation.) Financially also, the canals have been a great success; one canal in the North-west Provinces—the Eastern Jumna Canal—has paid for many years over twenty-five per cent. per annum on the capital employed in its construction; and all the canals together in the same province have paid over six per cent.; and this prosperity will increase as the distributories are extended and more land is irrigated. In the Madras Presidency, irrigation canals have been a greater financial success than even in Northern India.

Irrigation canals are also used for navigation; they are more used for this purpose in the Madras than in the Bengal Presidency. It is not, however, possible to make a canal in which the water runs with some velocity, a good water-way. The boats can go down-stream very well; but the difficulties of getting them up-stream are very great. Towing by means of steam-tugs has not been found to be suitable. On the Ganges Canal, in 1883, there were three hundred and twenty-five boats engaged in traffic. The towing of the boats up-stream is done wholly by men. In this canal, on account of the falls already mentioned, it is necessary that a navigation channel with one or more locks should be provided at every fall. By this means the canal can be navigated throughout its entire length. Although there is a considerable amount of produce taken down country by canal boats, still, navigation can be considered as of secondary importance only.

Still another purpose is served by these canals, especially at the falls on them. At some of these the whole water in the canal suddenly descends fifteen or twenty feet, and as the mass of water falling is over five thousand cubic feet in a second, there is an enormous amount of power generated. As yet, only a small part of this energy has been utilised. In the neighbourhood of the canals in the North-west Provinces a very large part of the wheat and other grains are ground by mills turned by water-power derived from the canals. The compact, but very effective turbine is the form of prime mover employed, with few exceptions, in these mills.

It is a matter of great regret to all the canal authorities in Northern India that more use cannot be made of so much valuable power; but the day cannot be far distant when it will be brought into useful action. It is said to have been proposed to light up New York by electric currents generated by dynamos which are to be worked by the Falls of Niagara. When this has been achieved, the same scheme will no

doubt be found to be applicable to the falls on the irrigation canals of India, so that they, too, may be used to turn machinery for any purpose that may be required.

PHYSICAL TEMPERAMENT OF MEN OF GENIUS.

ONE of the most interesting of studies, and yet one to which but few people direct their attention, is that exhibiting the peculiarities of mind and body which fall to the lot of those endowed with the power of shining above their fellow-creatures in the exercise of certain intellectual attributes—such intellectual attributes as are seen, for instance, in individuals devoted to the pursuits of literature; in great statesmen and warriors; in philosophers, poets, artists, and others. By analysing the minds and the corporeal peculiarities of such men we are enabled to pronounce a more just judgment upon them, and to observe how and how far we may admire and esteem the brilliancy of genius and talent.

Two of the most important phenomena which influence the lives of human beings are sensibility and contractility, both of which have their origin in the nervous system. Sensibility influences the character, the inclinations and affections, the will, the impetuosity or powerlessness of the imagination, the violence or moderation of the desires, and the activity or dullness of the intellect. Contractility always tends to the same end, contraction and effort, and alone acts and reacts.

The nervous system has a very great deal to answer for; and in close alliance with it are all the known forms of Temperament. There are the bilious and melancholic temperaments, and the lymphatic and sanguine temperaments. In some individuals these temperaments are mixed or compounded. Thus, Lafontaine, the learned and amiable Erasmus, and our great lexicographer, Johnson, were all blessed with temperaments compounded of the lymphatic and nervous. Apathy of character, a sort of happy-go-lucky existence, together with an extreme nicety of observation and a superior understanding—two leading features of goodness and greatness—belong to such constitutions.

In many cases the nervous apparatus possesses a vast amount of activity in company with the muscular system. There are men who by vigour of mind and power of muscle are capable of undertaking almost anything and surmounting every obstacle. Plato, whose all-powerful imagination has been the admiration of the intellectual world of all ages, was celebrated for his square herculean shoulders and vigorous bodily constitution. Julius Cæsar, too, that extraordinary combination of warrior, orator, historian, and statesman. Leonardo da Vinci, Ben Jonson, Buffon, Marshal Saxe, and Mirabeau, were all remarkable for their great corporeal strength. Still, men of extensive mind and herculean frame are rare examples.

The direction of the intellectual powers is determined by general modifications in constitutions, the nervous system participating in these modifications. The founder of the sect of Stoics is recorded to have been of the bilious tempera-

ment; that of the Epicurean philosophy of the sanguine. No wonder, then, that their systems diverged so widely. Again, the vivacious verse of Ariosto compared with the meditative pace of Tasso's muse, shows the predominance of the melancholic temperament in the latter, and the sanguine in the former. Corneille and Lafontaine were both great poets; but as the former was bilious, the latter phlegmatic, their genius bore different aspects, as did their verses. The physical temperament interferes with and makes its impress on the evolution of the nervous and intellectual powers, and it is this interference and impress which makes one painter delight in the tracing of the mild and sunny landscape, another in the wild and desolate; another in depicting the horrors of a scene of carnage, and another the joyous revelry of a roadside *cabaret*. The harmony of the nervous system with the other parts of the organism is the origin of the particular modes of physical and moral sensibility and the cause of the hidden impulse of diversified talent—the chances of fortune and of education being always excepted. This harmony exists in infinitely varying notes, and a scale of organic dispositions in exalted sensibility might be established if it were possible to graduate such a scale. These variations are always connected with some particular kind of organisation. Michael-Angelo and Giulio Romano, both of the bilious temperament, always represented similar characters. Raphael and Guido, both of the sanguine temperament, depicted life in all its beauty, purity, and brilliancy. They show us how in the enactment of the same art, the difference of minds, originating in the variety of temperaments, has a direct action on the productions of genius.

Medical men can testify to the heroic fortitude of mentally-gifted men in the most trying sicknesses. The same Rousseau, whom the veriest trifling contradiction or passing suspicion plunged into the most sombre melancholy, supported patiently through long years two painful and incurable bodily diseases. Many geniuses regard physical pain as a necessity of our nature, and are resigned to it; whilst mental agony would seem to astonish, to take them by surprise. The celebrated Pascal, whose mind in the later years of his short life was maintained in a state of enviable placidity by the firm faith he had in the resources of the Christian creed, but whose body was racked by the tortures of protracted suffering, would say to those around him, who were afflicted to behold his agonies: 'Do not pity me; all that I have to do is to submit myself humbly and peaceably.' Hogarth had an aneurism of the heart, which he bore manfully; but the fatal termination of the disease is said, with great probability, to have been hastened by the satire of the poet Churchill called *The Apology*. Even without the contrasted patience of moral and physical pain, there are men of high intellect for whom the latter has no terrors. The chemist Lavoisier was summoned during the Reign of Terror in France to his death: he calmly requested a few days in order to see the result of some experiments which he had in progress—in vain. This great philosopher of his day fell an immediate martyr to the political necessities of the ruthless tyrant Robespierre.

In some temperaments the great excitability of the nervous system necessarily leads to irregular evolution of nervous energy. In this consists the property which some have of passing 'From grave to gay, from lively to severe.' Livy, after stating that the elder Cato possessed a power of mind and strength of body that would have made him illustrious in any nation, adds that he had a versatile and malleable genius; and though serious in thought and stern in resolve, his intellect readily adapted itself to the lighter arts and occupations of life. Hence the power which a great poet shows in uniting himself with the feelings of all his fellow-beings, of partaking of their joys, their pains, their hopes, and their misfortunes; hence his sense of the ridiculous or the burlesque and his 'showing-up' of others' follies and feebleness; hence his enthusiasm for the great and the beautiful. And all these, if the mobility of sensibility is complete, are expressed by the man of genius with a richness of imagination and a grace that is ever varying, ever new. Dante's great mind imaged forth the beauteous Francesca da Rimini and the horrible picture of Ugolino and his sons. Cowper wrote the serious *Task* and the galloping *John Gilpin*; Pope wrote the *Essay on Man* and the *Rape of the Lock*; Byron, in the midst of all the reckless pleasantry of his *Don Juan*, introduces that glorious song to liberty, commencing with:

The isles of Greece! the isles of Greece!
Where burning Sappho loved and sung;

whilst Germany's great shining light, Goethe, wrote the meditative and terrific *Faust*, and likewise most merry and pleasing songs. This variable property of mind, however, is more prominently marked in the finished dramatist; for, in order to a complete identification, he must place himself in the situation of the person whom he would delineate, indue his character, his inclinations, and his sentiments. By Nature and by Nature's feelings only ought we to judge the merits of a dramatist.

By the same varied forms of physical and moral sensibility we observe how some men may cultivate, and with success, different branches of knowledge. Many who have admired the splendid colonnade of the Louvre are not aware that the architect was none other than Claude Perrault, a doctor of medicine. No Englishman hardly requires to be reminded of the wonderful versatility of genius displayed by the great Lord Bacon, at once a profound statesman, lawyer, and natural philosopher. Cardinal Richelieu, at the very time he was shaking Europe by his political craft, was in the habit of arranging and patronising *réunions* at the Hôtel de Rambouillet in which love-essays were read and discussed. Sir Humphry Davy, though a giant in the science of chemistry, was nevertheless a man of considerable poetical imagination. The varied talents of the art masters are repeatedly instanced in history—Michael-Angelo Buonarrotti, the inimitable sculptor, painter, architect and poet—by turns gloomy, profound, light, and sparkling, we behold him pass from the vast conception of St Peter's Church to the invention of a scaffold; from the tremendous scene of the Last Judgment to the droll tricks of Polichinello.

When we bear in mind this mental and phys-

ical mobility in men gifted with great genius, we can the more readily account for discrepancies of conduct and even of capability. The inequalities that so surprise the world may in great part be accounted for. Statesmen, scholars, and warriors are equally subject to similar alternations of cerebral weakness and vigour. This excess of sensibility produces various effects on the character and habits of those possessed with it, of which the most characteristic are irritability, vanity, and inconstancy of purpose. Pope made many and bitter enemies by his overbearing self-importance. Great actors are frequently found to be great egotists. Edmund Kean's standard of excellence was knowledge of acting; and he disliked the aristocracy because they were very ignorant on the point and could not learnedly discuss his merits. Modesty, however, is not incompatible with genius. There are some men of vast intellect who feel that there is a still far more elevated point than that which their genius has reached, and it is this feeling that accounts for their modesty.

Irritability is of frequent occurrence amongst men of genius. Perhaps those who have shown it in its most inveterate character are the older theological writers, in whom irascibility often settled into deadly hatred, giving rise to the proverbial *odium theologicum*. Abundant proof of irritability of temper may be found in Isaac Disraeli's *Quarrels of Authors*—Pope, Boyle, Davenant, Addison, and others.

The most exquisite productions of the human mind require both brilliant inspirations and profound meditation, as well as a certain exaltation of enthusiasm and a great degree of combining power. Genius as a rule consists in opposite powers, and yet these powers are admirably combined; the discordant mental attributes are harmonised. When we reflect upon the concord of faculties, the balancing of the most opposite powers, and the attendant specific organisation, we cannot but look upon great men as wonderful phenomena, which, like comets, are produced at distant intervals.

SOME SINGULAR SIGNS.

TRAVELLERS in China often derive amusement from the peculiarities of shop-signs there, many of which are couched in the most eloquent and poetical terms. In America, too, may be seen sign-plates of such curious occupations as hose-restorers, artificial-ear makers, child-adopters, salad-mixers, and so forth. But it is not necessary to leave the British Islands in order to find business announcements quite as curious in their way as those in other lands. In the Isle of Man, over the shop of a barber who supplies customers with all kinds of fishing-tackle, the writer was amused to read the following: 'Piscatorial Repository, Tonsorial Artist, Physiognomical Hairdresser, Cranium Manipulator and Capillary Abridger, Shaving and Hair-cutting with Ambidextrous Facility, Shampooing on Physiological Principles.' On a signboard in the town where the writer lives may be read this phonetic announcement. 'Shews Maid and Men dead Hear;' and when we add that it is over a cobbler's shop, the reader may discover its meaning.

A poetical shoemaker hung up the following remarkable effusion on a board over his shop :

Blow, oh, blow, ye heavenly breezes,
Underneath these leafy trees;
Sing, oh, sing, ye heavenly muses,
While I mend my boots and shoes.

Above an establishment in Liverpool not very long ago appeared the legend, 'Rages and Bones.' In another town can be seen the inscription, 'Cole and Wood, dealers in Wood and Coal;' and a street in Clifton is graced by a sign informing the passers-by that the owner thereof is a 'Milliner and Modest.'

A Bristol chimney-sweep once 'dropped into poetry' in this wise :

John Cummins lives here.
He'll sweep your chimneys cheap and clean,
With, or without, the new machine;
And if your chimneys catch on fire,
He'll put them out at your desire.

An inscription on a signboard in Lancashire announces the following miscellaneous articles for sale: 'Bibles, Blackballs, and Butter. Testaments, Tar, and Treacle, Godly Books, and Gimblets, Sold here.'

A shop-sign in London reads: 'Plots for novels or short stories. Prices reasonable.' The occupant of the shop is said to have a rare talent for devising plots, but no great powers of narration, so he is supposed to make his living by selling skeleton plots for stories in cheap papers.

Another singular business announcement over a certain photograph gallery is, 'Misfit photographs for sale.' This, we are told, brings many customers. Mothers, for instance, who have little children, often buy pictures of children with long hair when the hair of their loved ones hasn't grown, and send them round to friends at a distance. Brides' photographs are also said to sell very well.

'Teeth pulled while you wait' is a still more singular sign, said to have been set up by a dentist in Fleetwood.

This curious specimen of orthography was displayed on a house in a street in Marylebone: 'The Mangelling Traid removed hear from the Strete round the Cornir. Threhapense a Duzzen. N.B.—New Milk and Creme Sould Hear. Warentidd Fresh and not Stail evry Mornin'.'

A dealer in ice thus attracted public attention to his cold commodity :

Ice! Ice!! Ice!!!
If you want it pure and n }
And at a reasonable pr } ice
Follow no new dev
But send to me in a tr
At my off

'Irish and English' is the name of a firm in Buffalo, New York. The strangest thing about it is that Mr Irish is English, and Mr English is Irish.

As a precautionary measure, a Clapham jeweller painted on his shutters: 'NOTICE.—In every part of this house there is sure and certain death FOR BURGLARS. BEWARE.'

In a little village near Gloucester there was an inn situated at the foot of a hill, whose double-sided signboard bore the following :

Before the hill you do go up,
Step in and have a cheering cup.

On the other side :

You're down the hill, all danger past;
Come in and have a friendly glass.

At a small inn by the roadside, near a farmhouse called Highgate, can be read on a sign :

Highgate hangs high, hinders none;
Refresh, pay, and travel on.

He must have been a facetious hotel proprietor who hung up this sign in his rooms: 'Indian clubs and dumb-bells will not be permitted in any of the rooms. Guests in need of exercise can go down to the kitchen and pound a steak.'

A notice displayed in a Norway hotel is a curious specimen of 'English as she is spoke.' It reads as follows: 'Bath! first-class bath. Can anybody get. Tushbath. Warm and Cold. Tub-bath and Shower-bath. At any time. Except Saturday. By two hours forbore.' This brings to mind another specimen of foreigners' English, displayed on a notice posted up in an Art Exhibition in Japan to which foreigners were welcomed. Here are a few examples of the rules: 'Visitors is requested at the entrance to show tickets for inspection. Tickets are charged 10 sens and 2 sens, for the special and common respectively. No visitor who is mad or intoxicated is allowed to enter in, if any person found in shall be claimed to retire. No visitor is allowed to carry in with himself any parcel, umbrella, stick, and the like kind, except his purse, and is strictly forbidden to take in with himself dog, or the same kind of beasts. Visitor is requested to take good care of himself from thievery.'

An Englishman in Boulogne saw displayed in a shop window this notice: 'Eating and Drinking Sold Here.'

Doubtless, as curious as any of the foregoing is the puzzling sign in front of a small shoemaker's shop at Caunes. It is in English, and is thus worded: 'Repairs hung with stage-coach.' The visitor for whose benefit this information is intended, may, after much cogitation, arrive at the conclusion that the cobbler only wishes to inform his numerous patrons that repairs are executed with diligence.

A L O N E.

ALONE we tread life's devious pathways, sent
We know not whence, across our toilsome way,
Folded around in mists, uncertain, gray,
Shadows of hope and fear together blent.
Anon, the dull thick clouds apart are rent,
Love wakens, and makes glad the passing hours;
The way leads onward o'er upspringing flowers,
And past brooks murmur of a sweet content.
Yet, as we clasp and think this joy our own,
It fades—again in solitude we stand,
Watching the light wane o'er a darkening land;
The winds sob round us with a wailing moan;
When, all unlooked for, with a grim, firm hand,
Death opes the gate, and we pass out—alone.

MUSICAL MYTHS.

By J. F. ROWBOTHAM, Author of 'The History of Music.'

THE legend of Orpheus has been variously interpreted by the exponents of mythology, but however various their exposition, all seem to concur that the existence of a minstrel so accomplished as to make trees to follow him, and stones to move at the sound of his voice, is a fact which needs explaining by some hypothesis or another. A wider view of musical mythology than theorists are apt to take will, however, reveal the fact that not only have there been one Orpheus, but many Orpheuses in the world's history; that the whole chapter of man's imagination, which is mythology, teems with legends of music; and that so far from a scientific explanation being applicable to each, their very multiplicity would be a complete and effectual bar to such an attempt.

Of all the Orpheuses of primitive and savage legend—for the uncivilised races indulge in these fancies no less than their more educated brethren—Amalivaca, the divine minstrel of the Indians of Guiana, is one of the most curious. The whole earth was covered with water, and the rocks were prostrated by the flood; the beauty of the earth had completely disappeared under the chaotic onslaught of the destroying elements; and mankind, or what there was left of them, were in despair at the ruins of their once beautiful habitation, the globe. It was at this time that Amalivaca, the best drummer the world had ever seen, took his drum, made of the finest snake-skin, and beat upon it in time and measure so symmetrical, that the waters gradually sank delighted to the sea, and the rocks arose to listen. In this way, while he continued playing, the materials of the universe gradually sorted themselves until they attained the form they wear at present. Amphion building the walls of Thebes would perhaps be the classical analogy to this exploit of Amalivaca. Amalivaca also invented the first musical instrument which human ear ever heard—the rattle. Divine help was neces-

sary to him towards performing this triumph of discovery, pondering over which the musician wandered restlessly and uneasily about the banks of the Orinoco, not knowing what to do or how to satisfy his desire for music. In those days, says the legend, there was no musical sound in the world beyond what came from the untaught and sweet cadences of the voice of women. Music, with its regular beats and its regular refrains, had no existence; but Amalivaca had conceived the art in his mind. As he was walking down the reedy side of the Orinoco, a female form suddenly appeared from the water, and plucking off a gourd from a tree, gave it him, bidding him form an instrument therefrom. Still more perplexed, the sage pondered on his hard task, but without effect, until a second time the water-goddess appeared, this time bringing with her a handful of white stones from the bottom of the river, which she bade him enclose in the gourd. Thus was made the first rattle—and perhaps the first instrument which human ear ever heard.

So sacred and so miraculous did the South American Indians deem this discovery, that the rattle thus invented became an idol, which, with a worship peculiar to that continent, is adored with the same ceremonies and devotion which other uncivilised peoples pay to a figure of wood or stone. Numerous are the myths connected with this musical idol and its remarkable exploits. In many parts of Brazil it has, or used to have, a regular fraternity of priests devoted to its service, who regulate the ceremonies and enjoy the various benefits connected with their ministry. They consult the musical idol, on the payment of a certain fee by the laity—causing it to rattle so many times, and interpreting its responses with as much credulity and good faith as did the priests of Dodona the cooing of the doves. Sacrifices are offered to the idol at stated times, consisting of flesh and fruits, a hole being made in the side of the rattle to represent the mouth, and the choicest dainties pushed through there to satisfy the appetite of the god. Sometimes even human sacrifices are offered to this musical deity;

and warriors on the eve of a battle pass the night in silent prayer at its shrine.

Music has been used and is still employed by many uncivilised races to predict the future. The drum is the usual instrument appropriated to the office of divination, possibly for the very good reason that primitive peoples as a rule have no other. The Lapland wizards, who to the present day retain their ascendancy over the credulity of their countrymen, paint the luminaries of the sky upon their drum heads, together with figures of the earth, rivers, trees, mountains, &c., pretending that the instrument was the direct creator of the harmony of the world, in the manner of Amalivaca's drum, as we have just described it. This being assumed true, what more likely than that the same drum which reared the structure of the universe shall be able with very little trouble to give information relative to its affairs—in one word, to predict the future. By interpretation of its tapping, the drummers undertake to foretell the weather and the approach of storms, the probable success in hunting, the issue of any trade or barter in which a Laplander may be engaged. The drum serves these professors of its excellence as a sort of divining-rod, not unlike the hazel wand once so famous, by means of which they can discover a lost reindeer, or the whereabouts on the frosty plains of any article that has been dropped from a sledge. Among the Samoiedes and the tribes of northern Asiatic Russia the drum passes almost to an idol. They address it, erect it in their hut, and the priests of the superstition by the aid of the divine instrument effect that magical 'disappearance' which has puzzled all travellers from Sir Hugh Willoughby downwards to account for, and has given rise to as much guesswork at its elucidation as the feats of the Indian jugglers. The Samoiede, after beating his drum and working up the senses of his spectators to a pitch of great excitement, mysteriously vanishes into thin air before the eyes of all. Civilised travellers naturally hold that it is a trick. The Samoiedes themselves declare that the power resides in the drum-idol. The peculiar thing is that neither one party nor the other has been able to explain how the vanishing occurs.

The North American Indians, whose legends are a most interesting mine of strange traditions, make the drum the instrument of the angels. A tired hunter, once lost on the prairie, and overcome with fatigue and despair, lay down on the sward and fell asleep; when, behold, in his dream he saw the heavens open, and a car made of osiers descending from the sky with inconceivable rapidity. In the car were twelve beautiful girls with golden wings, who played celestial music upon drums of gold. Among them was his dead wife, thus sent to him by the Great Spirit to show him the right way out of the labyrinthine prairie. She directed him, pointing with her drumstick in the way in which he should go. The car flew up; the hunter awoke; and the heavens were resounding with the drums of the celestial maidens and of the angels in the vaults above.

A strange pendant to this tale, denoting still more strikingly the sanctity of the instrument, is to be found in another Indian legend supplemented by a practice. At stated festivals among

certain tribes, the elders of the tribe produce four sacred drums filled with water. Into these they affirm the waters of the world subsided after the deluge. They beat upon them, they say, to imitate the action of the Great Spirit, who by this simple musical means divided the earth from the waters, and restored order to the flooded globe.

The Mexicans were at a high point of civilisation at the time of the conquest; and their god of music—answering to Apollo among the Greeks—was Tezcatlipoca, to whom the flute was sacred. Tezcatlipoca was the most beautiful of all deities of the sky, and, in profound compassion for the miseries of man, had brought music from heaven on a bridge made of whales and turtles. These animals, transfixed with rapture at his beautiful song, had joined body to body in an illimitable line, all the whales and turtles in the ocean co-operating to form the endless pile, till the bridge reached from the waves of the sea to the skyey realms where Tezcatlipoca sat. Then the divinity arose, and clad in pure white, with twenty golden bells jingling round his ankles, and at his lips a silver flute, which he played in a most harmonious melody, he descended to the realms of mortal man. He taught flute-playing and the fabrication of that instrument to the Mexican priests, who, in his honour and out of gratitude to him for the boon, instituted the following singular ceremony. Once a year they chose the handsomest youth in Mexico, and dressed him in the same manner in which Tezcatlipoca had appeared to them with the golden bells round his ankles, and the constantly warbling flute in his hand. He was worshipped as a god for the whole year. At the end of that time he was sacrificed on an altar of jasper to the god of music, who required his life. The sacrifice took place on the top of one of the pyramid temples; and on his way up the interminable staircase, the unfortunate youth, followed by a priest carrying a sheaf of flutes, broke one flute against each step, to show that his glory and his delights as the incarnation of Tezcatlipoca were over at last.

The Chinese have extraordinary superstitions relating to music. According to them, the creator of the universe hid eight sounds in the earth, for the express purpose of impelling mortal man to find them out; on the same principle, we presume, that Jupiter in Virgil hides fire in flint and honey in trees, in order to whet the ardour of man's industry in re-discovering the treasures. In stone, in metal, in silk, in wood, in bamboo, in pumpkins, in the skins of animals, and in certain earths, these sounds, according to the Chinese, are hidden. The musical instruments of their orchestra are all made of one or other of these substances, and the naïve credulity of the people hears in the thuds of the gongs and the whistling of the pipes the tones of the eternal sounds of nature and the universe, as deposited in the strata of the earth by the Almighty Father. How was the musical scale first invented? That query, which has troubled the theorists of all lands, and has had its answer hitherto only in mystifying speculations and unintelligible theories, the Chinese will reply to by a legend most ingenious and most apropos, which, they hold, offers a complete explanation of the mystery. In the reign of Hoang-ty, they say, there was once a prince called Lyng-lun, who was the most beauti-

ful man and at the same time the most profound musician in China. He, under pain of a severe penalty by the order-loving emperor, was commanded to arrange and regulate Chinese music on the same principle whereon Hoang-ty had arranged law and politics throughout the Chinese empire. Full of thought, Lyng-lun wandered to the land of Si-jaung, where the bamboos grow. Having taken one of them, he cut it off between two of the knots, and pushing out the pith, blew into the hollow. The bamboo uttered a most beautiful note, to Lyng-lun's intense surprise. Simultaneously, the river Hoang-ho, which ran boiling by, roared with its waves, and the tone was in unison with the note of the bamboo. 'Behold,' cried Lyng-lun, 'the fundamental sound of nature!' Two magical birds then came and perched themselves upon some trees near, and sang one after the other the seven notes of the scale, starting from the tone which had been roared by the Hoang-ho and warbled by the bamboo. Here is a scale, say the Chinese, at once intelligible, inimitable, and easily revealed. Lyng-lun had merely to cut seven more bamboos and tune them to the pitches he had heard, and the scale was made. This he did; and thus was the art of music inaugurated and founded by Hoang-ty's court musician on a firm and unalterable basis.

Passing to the musical myths of European nations, the stories of the Greeks and Romans need not be here recapitulated, as containing little that could come in the shape of novelty. The middle ages were a prolific source of musical myth, and the learned chroniclers who did not hesitate to regard Alexander as a knight-errant who overthrew Darius in the lists, and Julius Cæsar as an emperor elected by the European diet which contained Pompey, Cato, Atticus, Scipio, and Solomon as its five electors, were not at all distressed by the often asked question, What is the origin of music in the world? According to them, there existed at the time of Noah a celebrated king entitled Blegabres. He lived before the Flood, and inhabited a land where, in the manner of a less illustrious namesake of his, King Cole by name, not only did music flow most sweetly, but other things besides of a more ardent nature, notably wine, beer, and mead. There is here perhaps a direct allusion to Noah's intoxication, but nothing is stated thereon in the tale. King Blegabres lived in this happy land, and listened all day long to the strains of cornet, psaltery, sackbut, &c.—in fact, the court breathed eternal music, as, according to Homer, the court of Æolus, king of the winds, is described, no less graphically and mysteriously, as doing. The memory of King Blegabres and his court, washed out by the Flood, was after a while revived by St Julian, the patron saint of minstrels, who, by a divine intuition, was enabled to report concerning the infancy of the musical art.

The Wends, who, we believe, are the ancestors of the modern Prussians, are the centre of many legends. The Pied Piper of Hamelin was a Wend; so also was the piper of the Harz Mountains, who appeared so many days a year, and played unearthly tunes, and whosoever heard at once fell into a frenzy, from which there was no escaping. All these pied and weird pipers assem-

bled once a year at the Brocken, where there was a general carnival, the Arch Fiend leading the concert on a violin, witches rolling round and fiddling on the skulls of horses, and the pipers adding the concert of their unholy instruments.

Most of the legends of the middle ages introduce a diabolical element into the music; and in concluding this short accumulation of musical myths we may remark as strange that the traditions of the art, which in early times and even among savage nations are the holiest and the highest, describing its influence as the diffusion of peace and order, and making gods and angels its expositors, should suddenly, when the middle ages are reached, take such an unexpected turn, regarding music as the direct production of the Evil One, and in every sense of the word sacrilegious and profane.

DUMARESQ'S DAUGHTER.

CHAPTER XXXII.—SHOPPING.

A FEW days after her arrival in Algiers, Psyche had so far recovered from her fatigue that Geraldine Maitland arranged a party to go down into the town together.

The winter visitors at Algiers live entirely on the Mustapha hill, at a distance of some two or three miles from the town and harbour. A breakneck Arab path, sunk deep in the soil like a Devonshire lane, leads the foot-passenger in a straight line by tumble-down steps to the outskirts and the shore: omnibuses and carriages follow the slower zigzags of a broad modern highway that winds by gentle gradients round numerous elbows to the town walls at the Porte d'Isly. Psyche and the Vanrenens, under Geraldine's guidance, took the comfortable tram (the horse-car, Cyrus called it) by this latter route, and descended gradually to the ramparts of the French engineers.

Once within the gate, in Algiers proper, Psyche felt herself immediately in the very thick and heart of Islam. Who shall describe that wonderful dramatic Oriental world—ever old, yet ever new; busy with human life as bees at a swarming, or ants when a stick has been poked into their nest; all seething and fermenting in a Babel of tongues, and hurrying and scurrying on every side for no possible or conceivable earthly reason? Algiers is the most fascinating and animated of Mediterranean towns. Dirty, malodorous, African if you will, but alive all over, and intensely attractive and alluring for all that, in its crowded streets and courts and alleys. Psyche was not lucky enough to meet on her entry a laden caravan of solemn long-legged camels, striding placidly out on their start for the desert; but the donkeys, the mules, the Moors, the Arabs, the infinite variety of colour and costume, amply sufficed to keep her attention alive as they threaded their way through that quaint jumble of all Mediterranean and African nationalities.

Geraldine, to whom all this was as familiar as Petheron, led them lightly through the vestibule of the town. Psyche was amused, in spite of her sadness, at the curious jumble of transparent incongruities in that antique new-fangled Franco-Moorish Algiers. Here, a little French *épicerie*,

ensconced half hidden in an ill-lighted shop, where Provençal bourgeois folk served out small odds and ends to bareheaded negresses; there, an Arab café, darker and dirtier still, where dusky cross-legged figures in Oriental costume, innocent of the laundry, smoked doubtful tobacco and tossed off cups of black steaming Mocha; and yonder, again, a little bazaar for Moorish curiosities, where a Barbary Jew in dark-coloured turban, jacket, and sash, ogled them in with oleaginous smile to inspect his cheap stock of Birmingham antiquities. At every step Psyche stopped irresistibly to gaze and smile; the town itself and all its stream of passengers unrolled itself in long and endless perspective like a living panorama before her attentive eyes.

They passed a big square with a well-kept garden of the formal French sort; a theatre that for size and imposing front might almost compare with the finest in Paris; a close-piled insanitary Arab quarter, by no means running with milk and rose-water; a tangle of lanes threading their way steeply up hill in every possible direction except a straight line, for which native architects appear to harbour an instinctive dislike; a narrow courtyard open to the sky; a white-washed mosque, where a respectable gray-bearded native *cadi* squatted cross-legged on the floor doing equal justice by summary process between his Arab neighbours. Railways, tram-cars, donkeys, and omnibuses; a European brass band, and a group of red-cloaked Arabs from the desert; Moorish squalor, dirt, and discomfort; the kiosques and journals and loungers of the boulevards! The main street through which they made their tortuous way was arcaded like Paris; but oh, what a difference in the surging crowd that thronged and filled it in unending variety! Arab, Moor, Kabyle, and Negro; Jewesses with their heads enclosed in tight black skull-caps, and their chins tied up as if they suffered perennially from an aggravated complication of mumps and toothache; and Mussulman women who showed above their veil but their great black eyes, yet coquetted so freely with those and their twitching fingers in the corners of their robes that Cyrus almost ceased to wonder as he passed at their prudent lords' precautionary measures.

They turned round by the brand-new minarets of the modernised cathedral, and entered the narrow little Rue de la Lyre. Ahmed ben Abd-er-Rahman (may Allah increase him!) has a Moorish shop in that dark thoroughfare which is the joy and delight of all feminine sojourners in the tents of Shem. Corona's face lighted up with pleasure. 'Why, we're going to Abd-er-Rahman's,' she exclaimed with much delight. 'That's nice, Miss Dumaresq. I do just love a good day's shopping down here in the Moorish part of the city.'

'Don't call me "Miss Dumaresq,"' Psyche said gently. 'Call me Psyche, won't you?'

Corona drew back in genuine hesitation. 'May I?' she asked. 'Well, I do call that real nice of you, now. I was afraid to be too much at home with Haviland Dumaresq's daughter, you see. But you ain't set up. It's right kind and friendly of you—that's just what it is. And will you call us Sirena and Corona?'

Psyche in her turn drew back, hesitating. 'Why, I thought you so grand when I first saw

you,' she said, taken aback. 'I was afraid to talk to you, almost, I was so dreadfully frightened.'

'Well, I do call that good now,' Corona cried, laughing.—'Say, Sirena, here's Psyche says when she first saw us she was most afraid to speak at table to us!'

'Well, I want to know!' Sirena exclaimed, much amused. 'Afraid of you and me, Corona!'

They both laughed at it as a very good joke; and Psyche, she knew not why, laughed too, for their merriment was contagious. They had reached by this time a darkling corridor in the dingy side-street, under whose gloomy arch Geraldine plunged undismayed, and led them all blindfold into a central court, where Psyche found herself at once, to her sudden surprise, in a perfect paradise of Oriental art, set out in an unaffected living museum of Oriental architecture. The courtyard was tiled and roofed in with glass: round the lower floor ran a pretty open arcade of Saracenic arches; the upper story was also arcaded, but hemmed in by balustrades of pierced wood-work, carved and latticed like a medieval screen in exquisite patterns. All round lay the usual farrago of Eastern curiosities: Damascus lamps, and Persian saddle-cloths, and Morocco jars, and Algerian embroideries, all scattered about loosely in picturesque confusion. In the centre, sat solid old Abd-er-Rahman himself in dignified silence—a massive old Moor in an embroidered coat and ample turban; he rose as Geraldine Maitland entered, and bowed her into his shop with stately courtesy.

'You're tired, dear,' Geraldine said to her friend, as she turned to mount the stairs to the second floor. 'The girls and I'll go up and look at the things in the gallery there.—Mr Vanrenen, you'll stop down here with Psyche, and find her a chair, for she mustn't fatigue herself.'

'Why, certainly,' Cyrus answered, nothing loth. He had a vested interest in Psyche now. He had seen a good deal of the pink-and-white English girl during these last few days—more white than pink, of late, unhappily: and what with Sirena's hints and Geraldine Maitland's obduracy, he had almost begun to consider with himself the leading question whether one high-toned Englishwoman mightn't do at a pinch almost as well in the end as another. So he sat and talked with her with a very good grace, while Corona and Sirena cheapened trays and Koran stands with Abd-er-Rahman himself in the upper gallery.

They waited long, and Cyrus at last began to covet in turn some of the pretty embroideries that lay heaped in piles on one another around them. He turned a few over carelessly with his hands. 'There's a beauty, now,' he said, taking up a long strip of antique Tunisian needlework and holding it out at arm's-length before Psyche. 'I expect Corona wouldn't mind that bit, Miss Dumaresq.'

'It is lovely,' Psyche said, 'as lovely as a picture. How much—an artist—would admire a piece like that now, Mr Vanrenen!'

She said 'an artist,' but she meant in her heart Linnell. Her mind went back at a bound to those old days at Petherton. Cyrus threw it lightly and gracefully round her shoulder. Your American, even though unskilled in the courtesy of words, has always a certain practical gracefulness in his treatment of women. He regards

them as something too fragile and costly to be roughly handled. 'It becomes you, Miss Dumaresq,' he said, gazing at her admiringly. 'You look quite a picture in it. It'd make up beautifully for evening dress, I expect.'

Psyche trembled lest he should buy that too. 'Papa wouldn't like me to wear it, though,' she put in hastily. 'I'm sure he wouldn't let me. It's against his principles.'

Cyrus leaned back on his chair and surveyed her with a certain distant chivalrous regard. 'That's a pity,' he answered, 'for I'd like to give it to you.'

Psyche made haste to decline the kindly-meant suggestion. 'Oh, how good of you!' she cried. 'But you mustn't, please. I'd rather you wouldn't.—Why, you seem to buy everything that takes your fancy. How awfully rich you must be, Mr Vanrenen!'

'Well, I ain't in want,' Cyrus admitted frankly. 'I can afford most anything I feel I'm in need of.'

'I've never known any rich people before,' Psyche said abstractedly, for want of something better to say. 'Papa thinks poor people are more the right sort for us to know.'

'No?' Cyrus murmured with genuine regret. He liked Psyche, and he wanted her to like him.

Psyche played with the corner of the embroidery, embarrassed. She felt she had said one of the things she had rather have left unsaid. 'But he likes *you*,' she went on with her charming smile. 'In fact, we both like you.'

'No?' Cyrus said again, in a very pleased voice. 'Now I call that real nice and friendly of him, Miss Dumaresq.'

Psyche folded up the embroidery and replaced it on the heap. This interview was beginning to get embarrassingly long. Just as she was wondering what on earth she could say next, Geraldine Maitland came down the steps with Corona and Sirena to relieve her from her painfully false position.

'Where next?' Cyrus exclaimed, jumping up from his seat. 'Sirena always goes the rounds of the stores regularly when she comes into the city.'

'To the photographer's,' Sirena said; 'I want some of those lovely views of the ragged boys.—These little Arab chaps are just sweet, Miss Maitland.'

So they went to Famin's in the Rue Bab-Azoun, where Sirena had seen the particular photographs she so specially coveted.

Psyche's eyes gave her no trouble now. She entered the shop and gazed around it fearlessly. On an easel in the corner was a painting of an Arab girl, standing under a doorway in the native town. Psyche's heart came up into her mouth as her gaze fell upon it. She was no judge of art, but love had taught her better than years in museums or galleries could ever have done to know one artist's hand. She recognised in a moment that unmistakable touch. It was a specimen of Linnell's Algerian subjects!

The colour fled from her cheek all at once. She gazed at it hard, and took it all in slowly. Then, all of a sudden, as she still looked, for the first time since she arrived in Algeria, the shop and the picture faded away before her. She

groped her way over to a chair in her distress. Thick darkness enveloped the world. Cyrus, astonished, led her over to a chair. 'Thank you,' she said, as she seated herself upon it. 'Geraldine—my eyes'—She could get no further.

Geraldine understood it all with feminine quickness. She beckoned Cyrus out of the shop quietly. 'Run for a *fiacre*,' she said, herself all trembling. 'You'll find one opposite the mosque in the square. Her eyes have gone again. I know what's the matter. That's one of the pictures Mr Linnell painted. Psyche was very much attached to him indeed, and he died at Khartoum. I tell you this to secure your help. Don't say anything more about it than you can avoid at the Orangers. And tell Corona and Sirena to keep it quite quiet.'

Cyrus nodded assent. 'You may depend upon me,' he said; and he was off at full speed to get the *fiacre*. When it arrived, he led out Psyche with tender care, and placed her like a brother in the corner of the cushions. They drove up in silence, for the most part, Geraldine alone having the courage to make occasional pretences at conversation. By the time they reached the gate of the Orangers, the veil had fallen again from Psyche's eyes. But her father, who met her at the door with his searching glance, was not to be deceived. 'Your sight went again,' he said with awe as he scanned her pallid face. And Psyche, too truthful to try to hide it, answered merely, 'Yes, Papa,' and hid her sorrow straightway in her own little bedroom.

OUR CITY OF NATIONS.

THE cosmopolitan character of London is generally known, but perhaps indifferently realised. Statistics are sometimes presented showing how large an army of strangers is in occupation, and of what curiously mixed contingents it consists. But it is hard to clothe such figures with the interest that would bring about their proper appreciation. And the wonderful, mobile, shifting mass is a marvel from so many points of view, that curiosity is easily satiated without considering details. The great metropolitan hive may fitly be called a 'City of Nations.' Make a leisurely, observant exploration of certain districts, some of which have well-defined boundaries though no Custom-house officer inflicts the ignominy of inspection and no passport is demanded. Talk with the inhabitants. Note how the musical tongue of the far-off southern vineyard, and the *patois* of the mountain, and the guttural speech of the plains between great rivers, 'shadows' in the conversation the troublesome English—fair copy or ludicrous travesty. Study the men and the manners, the dress and the ruling occupations of each separate and contrasted locality. Then come back to the numbers recorded in official sheets, or in an Encyclopedia, and they will be dry and meaningless no longer.

At the head of the list, in point of numbers, of Continental peoples represented are the Germans. A steady stream of recruits from the Fatherland has for many a year poured into English counting-houses. Not every one is pleased by the competition thus rendered more rigorous. Home-bred clerks grumble; they say the bread is taken

from their mouths; and the sense of injury sustained is keen. But the remedy must surely be to win such an equipment as to warrant expectation of success whatever the press of alien applicants. Let our young clerks have as much plodding industry, indomitable perseverance, and concentration of purpose, as the Germans, and get to know as many languages, and their risk of being passed in the race will be much reduced.

Naturally, the tide of German immigration has greatly scattered itself. A cheap home has to be sought by the majority of the newcomers, and they turn east, west, north, or south, as opportunity directs. The room or rooms that suit may be in Islington or Kennington or away at Stratford. There are always means to bring the worker to his work for a few pence.

As the crow flies south from St Paul's, it is no far cast to a true German colony. Here, on the edge of Camberwell, Denmark Hill rises. As the reading world knows, and as Camberwell residents doubtless delight to remember, many of the scenes in *Madcap Violet* are placed in this locality; and Mr William Black incidentally refers in his novel to the prevalence of the German idiom. His heroine waits in Victoria Station, and others are waiting too: 'Friends bound for the same house. They were joking merrily. They were young Germans, and a trifle boisterous.' Well-to-do merchants reside hereabouts, perhaps some of those who figure in the column and three-quarters devoted to the letter Z in the commercial section of the Post-office Directory, and who are German or Polish almost to a man. And near to the station is a little German church, where the Lutheran service is rendered, and the spirit-stirring hymns of the reformer, whose words were 'half-battles,' are often sung.

The number of Kaiser Wilhelm's self-exiled sons and daughters of the Iron Empire in town and suburb, together with London-born descendants of German parents, is reckoned at upwards of sixty thousand. In the war-time twenty years ago, there was of course a great fluctuation; but now the figures may be said to grow daily.

France sends the English metropolis about half as many of her children. There has been a history belonging to repeated arrivals of companies. In bygone centuries they generally crossed Channel in the character of refugees, and they found Londoners uniformly hospitable. The revocation of the Edict of Nantes about the end of the seventeenth century brought over a very great number of resolute Huguenots. They settled in Soho, Leicester Square, and St Giles, in Chelsea, and Wandsworth. The Reign of Terror caused many royalists to seek shelter in the district about Southampton Row, in Somers Town, and elsewhere. The tide never set back again; and others drifted over and joined the descendants of the older and compulsory exiles. At a date now remote, the region around Leicester Square had the fame which it still keeps of a foreign ground within an English city. Here was the true 'Petty France,' though York Street, Westminster, once had the name from its homes of foreign wool-staplers. William Maitland, the topographer, in his *History of London* (1739), says that in this vicinity it was 'an easy matter for a stranger to fancy himself in France.' If the diffi-

culty of such a mental feat has increased, it is because of the greater fullness and variety of the constant traffic current, not through any replacement of the abiding French sights and sounds by purely insular ones. The Gaul is still in these quiet back streets, these noisy short-cuts, these restaurants, these haunts of unfamiliar industries. The shops show at once to the initiated critic the nationality of the common customer. The foreign names are in keeping now with the wares in the windows. The provision-dealers make the many condiments that are so dear to the French palate a leading 'line' in their trade. Small 'generals' are here in profusion, but there is a special stamp upon their stock. The British artisan would be at a loss to know how to use a large proportion of their wares. And then, as has been hinted, peculiar callings are followed in the shabby, heated, evil-smelling back buildings. The man in the blouse, volatile, fierce, given to gesticulation, bends over strange pipe-carving or dresses hats with the true Parisian gloss. If times are bad and the prevailing moods morose or sardonic, the stray inquisitor may hear himself satirised in untranslatable communistic slang.

The Frenchman is not behind his traditional adversary, the German, in fraternising with his fellow-exiles. Social clubs exist in considerable numbers, and have many shades of worth and unworth. They preserve and foster the spirit of nationality. When one of them is in session—of course in a house which is French as to its master, French as to its appointments large and small, French as to its atmosphere, object, and language—the whole might be transported entire, like a piece of stage furniture, and dropped into a niche in some faubourg by the Seine, and provoke no comment by its incongruity.

The Italians in London are fewer; but they also have their colonies—each a small 'reserve' in the big city-state, a subsidiary centre in the great maelstrom. Hatton Garden is such a rendezvous. In the rough square shut in by Gray's Inn Road, Holborn, Theobalds Road, and Farringdon Road, numbers of swarthy street musicians, *chefs*, and art workmen, more or less skilled, congregate. It is not exactly an inviting locality. The streets hint at changed years and lost gentility. Things are not as they were when Wycherley, the author of the *Plain Dealer*, came here to seek for his wife the rich and lovely young widow, the Countess of Drogheda. But given a sunny day and Imagination's kaleidoscope, and patterns of the brilliant South shall be found here. Step into an Italian restaurant and note the sombrero of the Florentine, the high slanting hat of the Savoyard, the gay head-dress of the girl who touches a tambourine with airy fingers and a changeless petition in the sloe-like eyes, and a smile which says: 'Signor, you must be rich here in your London; I want to think that you are also kind.' Observe the jewellery, the bright yet not inharmonious colours, the regular features, the olive complexion of the artist's model, who stands at the first counter paying part of her slender fee for strange oozing cake, the taste for which not less than the making would be a mystery to an English maiden. And others are passing without. See you not the deep unfathomable azure of Roman skies bending over

the white headgear? Is not that a glimpse of the Campagna beyond the Roman plaid scarf? Alas for the girls! it is just Fancy's trick. A few steps nearer the thunder of Holborn, and the illusion fades.

The indicative 'i' is the last letter now over many a window and on many a doorplate. At certain hours and seasons the organ-grinder is much in presence. Frequently he hires his 'machine,' and the bond regularly brings him to and fro. There are people, studious persons particularly, who regard this man as a true Ishmael, with his 'organ'-hand against every man, and would incontinently suppress him. But away in the interminable streets, which are all so like each other, and so bare of colour or of change, he is less unwelcome. The lads and lasses are his patrons. He is the humble minister of some hope that after all the world is not a dead level.

Extreme poverty is the lot of many Italians in London, and in Hatton Garden the hard fact is practically recognised. In Greville Street are the offices of a very useful relieving institution, initiated by the home government of these waifs, and presided over by the Italian ambassador. The Italian Benevolent Society does a good work.

The Dutch dwellers in London number at least fifteen thousand, and the Poles almost as many. Owing probably to the paternal and ultra conservative constitution prevailing as yet in Russia, the subjects of the Czar are less frequently met with. The Greeks, who may some day go into rivalry with the Colossus of the North for the ultimate ownership of Constantinople, are fifteen thousand strong. The City knows the Greek merchants well. On the Mark Lane Corn Exchange they almost monopolise the importation of grain and of seeds from every country figuring in the lists of supply. But the residences of these masters of London's food are often far afield, and not necessarily in the same quarter. As wealth increases, the gregarian instinct seems to lose its power.

There has been another nation settled in the metropolis in the persons of a compact body of representatives from early times; and in many respects this people is the most separate and self-contained of any. Observation would perpetually point them out for a unique race, even if history, sacred and profane, did not bear this witness. They have been oppressed, contemned, persecuted; they have never been absorbed. Beaten into the dust by race-hatred, extermination has always proved impossible. There are believed to be forty thousand Jews in London. The ancient Jewry was in the immediate neighbourhood of the Tower. A peep at its stony records is given in the pages of Stow. Ultimately, the quarter given up to the Jews comprised some part of Spitalfields, of Whitechapel, Houndsditch, the Minories and Bevis Marks. Social and race division located them severely in a sort of Ghetto. Since the temper of the time became tolerant they have spread even into the far suburbs. There is a section of the West where an entirely new Jewish colony has slowly congregated. In spite, however, of this modification of rigorous line and limit, the old spots retain the old characteristics. The nation is itself in its own streets and in its own

callings—both held of prescriptive right. No error can be made concerning the prevailing type by the most completely uninformed wayfarer who wanders into the byways east of the Royal Exchange. Prejudice has said numberless hard things of the seedy-looking men whom you shall see standing at the doors of stuffy shops, or hear cheapening a suit with an obstinate accent that will never be smooth English. But they have also found their defenders. Chronic dinginess and disregard of soap and water have been charged against them. Says Henry Mayhew: 'The Jew old-clothesmen are generally far more cleanly in their habits than the poorer classes of English people. Their hands they always wash before their meals, and this is done whether the party be a strict Jew or "meshumet," a convert or apostate from Judaism.'

And in these districts there are the same distinctive signs in dress, in cast of countenance, in articles displayed in beetle-browed windows or upon street stalls, and in the current gibe and repartee of the thoroughfare, that speak of the stranger possessing his parcel of bricks and mortar within the gates. Pay the people visits at various times, inquire the meaning of much that passes, and a whole world of hidden custom and tribal habit will be brought to light. The Jews of London are not swept into the vortex of change. They are a nation in the great city still, peculiar in the routine of daily life, in feast and fast, in religious observance and the shaping of social ties.

The list of metropolitan nationalities does not close here. From every clime they come—the Turk, the Portuguese, the Spaniard, the Norwegian, the Swiss, the lithe Asiatic, the dusky African. London receives them all, and, alas for the difficulty of wise almsgiving, starves some. Many a foreigner seeks gold, and finds but a grave on Thames-side. There is a profound pathos, as well as a cause for marvel and pride, in the thought of the far ends of the earth gathered into Our City of Nations.

THE ROMANCE OF A SUMMER.

CHAPTER III.

LETTING her eyes fall once more on to her book, Avie felt the hot blood surging up into her cheeks. Who or what was this man, whose very presence seemed to fill her with uneasiness, and why had he come into that unfrequented glen? These questions rose unconsciously to her mind as she bent, or rather tried to bend, her eyes upon the printed matter before her until such time as it should please the intruder to pass on. But if she had hoped by her unconscious air to send him away she was doomed to disappointment, for, taking up his stand almost directly in front of her, he said politely: 'Have I the honour of addressing Miss Sacharty?'

The low musical tones and the slightly foreign accent with which he uttered these words attracted her strangely, and with a slight bow she acknowledged the truth of his words.

'Ah!' he cried, seating himself unbidden on the turf near her, 'that is indeed delightful! Your father is one of my greatest and most valued friends.'

Avice did not reply for a moment; she was too much astonished to say anything, until the man's curious dark eyes fixed themselves suddenly on hers with a strange intense gaze and seemed to drag an answer from her.

'You come, then, from India?' she said, idly turning over the pages of her book.

'From India, yes,' he replied, a swift smile parting for a moment the thin line of his lips. 'I am Indian myself, or rather Malay. My name is Tehandar Mutwanee, at your service.—I read your name in the books,' he added by way of explanation, 'and I thought it must be the daughter of my old friend.'

Avice smiled. Somehow, in spite of her first feeling of dislike, the man fascinated her, and she no longer felt the impulse to run away which she had had at first; and for some time they sat on there, under the whispering trees, chatting about India, which Avice remembered but faintly, any allusion to it having always been discouraged by her aunt.

At last the lengthening shadows warned them that time was getting on, and they returned to the hotel, Tehandar carrying the rug and book, which he delivered up into Avice's keeping as she went up-stairs.

'We shall meet again at dinner,' he said with a smile as he turned away. 'I will contrive to sit near you, and then we can talk about India again.'

Avice nodded brightly, and ran up-stairs to seek her friend, whom she found already dressing for dinner.

She looked decidedly astonished when the girl related her adventure. 'Are you quite sure he is what he pretends—your father's friend?' she asked doubtfully. 'It would be so easy for any one, attracted by your name, to fabricate a tale in order to make your acquaintance.'

'Oh yes, I know; but he seemed to know all about papa—things, I mean, which only a friend would know; and besides, he knew Aunt Amelia by name; he asked after her. And he said he had seen me when I was quite a tiny baby.'

'Oh well, I suppose it is all right,' returned Mrs Douglas, examining her hair critically with the hand-glass. 'But do be quick dressing, my dear; we shall be fearfully late if you don't make haste.'

And Avice fled to her own room, which was just beyond, and began making up for lost time, her mind all the while occupied with her afternoon's experiences and Tehandar Mutwanee.

It was not long before she joined Mrs Douglas, and they went down-stairs together. Tehandar Mutwanee was standing before the fire, which, in consideration of the chilliness of the evening air, burnt brightly on the hearth. He advanced to meet them as they entered.

'My friend, Mrs Douglas—Mr Mutwanee,' said Avice shyly, by way of introduction.

The Malay bowed profoundly. 'I am charmed to make Mrs Douglas's acquaintance,' he returned in those soft mellow tones of his; 'and shall feel proud if I, too, may be reckoned among the list of her friends.'

Mrs Douglas acknowledged his greeting with a slight bend of her golden head, and passed on to Mrs Barfelt's side, leaving Avice to talk

to her new acquaintance, who, with no conscious will on her part, fascinated her more and more.

'It seems so strange to meet a countryman and a friend of my father's, here,' she said, smiling, as Mutwanee gallantly led her into dinner. 'Such an odd coincidence, you know!'

A curious smile lit up the dark face of the other as she spoke. 'A pleasant one, too, I hope,' he murmured softly. 'For me, it is, at anyrate.'

Avice did not reply for a moment; then again she felt that obligation to answer. 'Yes, very,' she returned shyly, turning her attention to the *menu* card by her side.

Her companion glanced at it too, with the air of a connoisseur. 'Fish, soup, partridge (roasted), fricassée of mutton—um, um, um. I should recommend some of this, *poulets au riz*,' he said, as Avice laid down the card. 'As an *entrée* it is very good.'

If there was one thing she detested it was *poulets au riz*. 'I don't really think I will have that,' she returned as she tasted the soup; 'I am not partial to chicken.'

Her companion said nothing at this moment; but as the waiter whisked away her plate, he looked quietly at her, saying, more in the tone of one who makes an assertion than of one asking a question: 'You will change your mind, and take some chicken, will you not?'

And then it appeared to the girl as if, after all, she would change her mind; and mechanically, like one saying a lesson, she ordered the waiter to bring her chicken, instead of—as she had at first intended—partridge; and again that curious half-mocking smile stole into the black eyes of Mutwanee.

This little incident made her rather uneasy—a faint vague fear of this strange man, who fascinated while he alarmed her, came upon her, and she was not sorry when they rose from the table.

On the hall table, on her way to the drawing-room, she found a letter from her father. It was dated Berlin, and bore the German post-mark; but in it Mr Sacharty announced that he was returning to England almost directly, and hoped that he might see something of his daughter before long, as he was engaged to stay with friends in the neighbourhood of Strath Carron. He added that he had heard from an old friend of his who was going to Strath Carron—'and who, indeed, will be there ere this reaches you; and I hope and trust that for my sake you will treat him with all courtesy and kindness,' the letter went on, 'for to Tehandar Mutwanee I owe more than I can tell you of friendship and respect.'

The girl's eyes sparkled as she read this. 'How very odd!' she murmured; 'but it will satisfy Mrs Douglas of his respectability.'

And as events turned out, Mrs Douglas was only too glad to be convinced of his respectability and general fitness to be Avice's companion; for she had just discovered an old friend in a certain Mrs Digby Browne, who had arrived that afternoon, and was too busily engaged in chatting about old times to pay much attention to the girl.

'I wonder what Aunt Amelia would think of him,' thought Avice to herself later on that same

evening as she brushed out her long wavy hair. She had a dim consciousness, somehow, that Miss Marchmont would not altogether approve of Tehandar Mutwanee; and yet what there was to dislike in him she could not say. Polished, agreeable, highly cultivated, with a flow of language and store of anecdote which were surprising, he certainly made a most charming companion; and in spite of her half-acknowledged fear of him, Avice drew a fairly-glowing picture of him in her letter to her aunt ere she retired to rest that evening. But one thing she did not mention, and that was the curious manner in which she felt compelled to execute his will in the veriest trifles, and the sense of nervous oppression which seized her every now and then when his eyes were upon her.

It was the custom in the hotel for any visitors who wished to have letters posted for them to place them on a tray put for that purpose on a table in the hall, when they were taken to the post by one of the servants. As a rule, Avice preferred posting her letters herself, disliking the publicity of the hall table; but the next morning, being somewhat in a hurry, and fearing to keep Mrs Douglas waiting, she placed Miss Marchmont's letter on the tray as she went out. It was about eleven o'clock, and all the other visitors had already gone out, either to the baths or on some expedition—all, that is, save one. Tehandar Mutwanee was sitting in the smoking-room as Avice passed through the hall, and seeing her through the half-open door placing a letter on the table, he slipped out as soon as she had gone and proceeded to examine the address. Something in it seemed to displease him, for he gave a low grunt of dissatisfaction, and then, hearing footsteps coming, replaced it quickly and began searching for his hat. The footsteps drew nearer, and soon the red head of Andrew, one of the waiters, appeared round a corner. He looked curiously at the dark face of Mutwanee as he passed, and the latter, who was struggling into a greatcoat of enormous thickness, returned his gaze with interest, until his pale blue eyes were obliged to fall beneath the piercing black orbs.

'Shall I take this to the post for you?' said Mutwanee, politely indicating Avice's letter as he spoke. Andrew, as he knew, was the one generally told off for such errands.

The waiter glanced at him sharply. He was not accustomed to having his work done for him, but neither was he inclined to refuse a good offer. 'Thank ye, sir,' he replied slowly. 'I dinna think there could be muckle harm, if ye're gaun to the town.'

And Tehandar, hastily availing himself of the permission, took up the letter and went his way. But he did not go towards the village; on the contrary, he turned his back upon it; and Avice's letter never reached the post, but lay opened and crumpled in his inner pocket for many a long day.

Days came and went, and Tehandar Mutwanee still stayed on in the little Scotch watering-place, although it was palpable to all that he had not come there for the baths, or even for the waters, for a course of which even the strongest usually went in. He was generally to be seen with Avice and Mrs Douglas—often even with Avice

alone—and besides them, he seemed to have few or no acquaintances in the place. It was pity for his loneliness, partly, and partly also a desire to please her father, which had led Avice, and through her, Mrs Douglas, to adopt the foreigner into their set; and having once been adopted, he had no mind to be dropped again; and thus it came to pass that in all their rambles and excursions he generally made one. He exercised a curious subtle power over Avice herself from the first; and by degrees, it had grown stronger as he became more intimate with her, until at length the girl, frightened at first by the strange unaccustomed feeling, had unconsciously ceased to struggle against it, and indeed seemed almost to court its power.

Two or three days of damp uncertain weather were succeeded by one of such extraordinary splendour that Mrs Douglas declared they ought to celebrate its appearance by some grand expedition; and after much debating and careful weighing of all the pros and cons, it was unanimously decided that they should make up a party and visit a curious old mansion in the next village, which was said to have formed one of Prince Charlie's halting-places during the '45.

The party was quite a small one, consisting only of Mrs Douglas and her friend Mrs Digby Browne; the latter's daughter; a certain Oliver Westall, with whom they had become acquainted through Mrs Barfelt; Tehandar Mutwanee and Avice; and they set off gaily soon after breakfast, determining to lunch at the inn of Inchbothie, returning home for dinner.

Miss Digby Browne, having a decided horror of foreigners in general and Tehandar in particular, established herself under Mr Westall's protecting wing; and as the two elder ladies were deep in the criticism of a mutual friend, it fell out that Tehandar and Avice were left to each other, a state of things which gave the former at any rate deep satisfaction.

'You must explain it all to me,' he said with a smile, as Avice made some remark about the historical interest of the place; 'for I am afraid that I am very ignorant in the matter.'

And though Avice modestly professed herself to be about as ignorant as he was, he refused to be guided about the house by any one but her. It was an old house, built in a variety of styles, and, when the owners were away, quite the show-place of the country-side, full of old ancestral portraits and curious heirlooms, many of them rendered sacred by the touch of royal fingers, or consecrated from time immemorial to none but royal use. There was even a legend that once, during one of his periods of exile, Robert the Bruce had sought the shelter of its friendly walls, and the room was still shown where he passed the night.

'We must go and see that!' cried Avice enthusiastically, as they all stood together in the old oak-panelled hall debating where to go first. 'Come, Mr Mutwanee, you and I will set off and lead the way. The guide-book says it is at the back of the house on the second floor.' And followed by the willing Tehandar, she disappeared through the door.

Oliver Westall gazed after her with a look of grave disapproval, not unmingled with anxiety.

'She is such a charming girl,' he muttered to himself: 'surely she can't be intending to marry that fellow; and yet she certainly does encourage him decidedly.'

The latter part of this statement seemed true enough; for all that day Tehandar never left her side, and she appeared anything but bored by his attentions. It was growing late, and Mrs Douglas was beginning to think of turning home, when suddenly, as he and Avicé leant over one of the battlemented turrets, revelling in the beauty of the scene below, Mutwanee began softly: 'We have known each other quite a long time now, Miss Sacharty.'

'More than a week!' returned Avicé, laughing.

'More than a week!' he echoed, turning his dark eyes full upon her—'to me it seems a lifetime—a life-time of happiness. Oh Avicé, my pearl, my jewel, say you will turn the friendship of these days into the love of eternity! Avicé Sacharty, I ask you to be my wife!'

A cold shiver passed through the girl's frame; it was scarcely due to the September air. 'No, no!' she cried feebly, raising her hands, as if to shut out the power of his gaze. 'No; I cannot, I cannot!'

'Cannot!' he said softly, but with a persuasive accent in his mellow voice, drawing down her hands as he spoke with a gentle but firm persistence against which she was powerless. 'Nay; think again; cannot? Why "cannot?" Let it rather be "can" and "will!"' And as he spoke he bent his gaze upon her with renewed intensity. 'Say yes! sweet one. See, it will be easy!' In spite of the term of endearment and the coaxing tone, the words seemed more like a command than an entreaty.

Again that nervous shiver passed over her, and she was silent. Was it a battle with a stronger will which kept her dumb? Who can say?

Tehandar paused, as if waiting for an answer. 'I am rich, rich,' he whispered. 'In my own country I am a prince—a rajah; but if I have not you I am poor. But you will say yes—yes, I feel it!'

The strong will triumphed. Avicé bowed her head. 'It shall be, then, as you wish,' she returned wearily. 'Yes; I will marry you some day—some day,' she repeated, as if to reassure herself. 'But now, let us go; the rest are waiting.' She turned away, a strange bewildered feeling in her heart; and Tehandar followed her, a triumphant light in his dark eyes.

'Your congratulations, Mrs Douglas,' he said suavely as they parted in the hotel hall. 'Miss Avicé has consented to be my wife.'

Mrs Douglas looked amazed. Somehow, it had never entered her head that Avicé would marry Tehandar Mutwanee—the thing was absurd on the face of it; and she determined to take her young friend severely to task when they got up-stairs, dim visions of Miss Marchmont's wrath disturbing her peace of mind; but the hall was too public a place for a 'scene,' so she smiled her congratulations politely.

One person, however, looked gravely displeased as he noted the Malay's look of triumph, and Avicé's evident shrinking from notice, and that person was Oliver Westall. A student of nature from his earliest years, he had been strangely attracted by Avicé from the first night of her

arrival; and if hitherto we have said nothing about him, it is because he had always been content to stand aside and watch with critical eye the different phases of human life which are so plentiful in a little place like Strath Carron.

Avicé had always greeted him kindly with the bright sweet smile which seemed like a ray of warm June sunlight let loose on the world, and for that reason, more than any other, Oliver Westall took a deeper interest than ordinary in the girl's welfare.

'What a pity!' he murmured, shaking his head sadly as he retired to his own room to dress. 'She was such a sweet girl; and he—— Well, I don't know what her parents can be thinking about!' And later on, as he wrote to his particular chum, Jack D'Arcy, he told him the little episode, with a few cynical observations of his own on the vanity of all human things, intended for his friend's benefit and his own comfort.

In the meanwhile, Mrs Douglas, conscious, perhaps, of having somewhat neglected her duty to Avicé, was satisfying the qualms of her own conscience by reproving the girl severely for her 'rash and foolish engagement,' in a manner not calculated to soothe or calm her decidedly agitated spirit.

Did Miss Marchmont know anything of the affair? she inquired at length, having exhausted all her other arguments—or her father?

Avicé was obliged reluctantly to admit that neither of them knew anything of the matter. Her father was comparatively a stranger to her; and as for Miss Marchmont—well, for some inexplicable reason, she declared that she had not been able to write about Tehandar Mutwanee to her aunt, except once, and then no notice whatever had been taken of her announcement. 'Even though I said he was a friend of papa's!' she added, as if to remind Mrs Douglas that this was the case.

But Mrs Douglas refused to be reminded, and began attacking the first part of her assertion. 'Why couldn't you write to your aunt about him?' she asked in some astonishment not unminged with incredulity. 'It is so silly to talk like that, as if any one were preventing you!'

'That's just what I felt!' began the girl eagerly. 'My tongue—I mean my pen—— Oh!' she exclaimed, 'I simply couldn't write it—that was just what I felt.'

Mrs Douglas began to grow slightly alarmed. Was it possible that the excitement of it all was affecting the girl's brain? Was this man exerting some strange occult power to fascinate the girl, and lure her into his toils? The idea was absurd; but still, Avicé herself was half an Eastern by blood, and Eastern people were very excitable. And her suspicions being confirmed in a degree by the girl's flushed cheeks and unnaturally bright eyes, she promptly sent her to bed, saying as she did so, 'I shall write to your aunt myself to-morrow, and then we shall see.'

But the morrow unexpectedly brought Mr Sacharty to the hotel to see his daughter; and in the private tête-à-tête which Mrs Douglas had with him, he soon convinced her that the match had his entire approbation, and declared that he himself would acquaint Miss Marchmont with all particulars.

To tell the truth, the easy-going matron was not sorry to relinquish the task to him, for she stood in considerable awe of the grave spinster, who was more her husband's friend than her own, and did not care to risk an explosion of her ire. To his daughter herself Kilnur was kinder than he had ever been, and joined his entreaties with those of Tehandar for a speedy wedding. 'It would be so nice, you know, if you could go out with him when he goes back,' he said one day as he and Avice returned from a ramble among the hills. 'He has such a lonely life, poor fellow, and in spite of his wealth is often very miserable, for lack of a woman's help and comfort.'

And Tehandar himself murmured the same in her ear as they sat together under the shade of the pine-trees, or wandered up and down the heathery braes drinking deep draughts of the pure strong mountain air; and his words, so often repeated, yet always with some tender variation, seemed, for all their pleading, like commands that could not be disobeyed, until at last Avice, in spite of herself, was obliged to consent, and promise to marry him soon—yes, very soon; when she did not say, but it should be soon.

She was looking dreadfully ill and worn, poor girl; so much so, that others besides Oliver Westall were beginning to notice it, and to say to each other doubtfully that being engaged did not seem to agree with Miss Sacharty. The fact was that she was perfectly sure in her heart of hearts that she hated Tehandar Mutwanee, hated him with all her soul; and yet she could not, do what she would, shake herself free from the fascination which he exercised over her. She longed intensely to be able to snatch off her betrothal ring, a costly one of curious workmanship, and throw it in his face, retracting at the same time her promise to be his wife—and still she dared not. The power of his superior will seemed entirely to have dominated hers; and with the calm gaze of those unflinching eyes upon her, she felt that had he commanded her to hang herself she could not have disobeyed. 'If Aunt Amelia were only here!' she moaned as she tossed restlessly from side to side in the dark night hours—'or Mr Standish!'

But she would not have been able to tell them anything if they had been, for she had tried many a time to write a statement of the case to her aunt; and every time, as she told Mrs Douglas, an indefinable something seemed to stay her hand, and she could not write it.

It was with considerable surprise one morning that she received a letter from Miss Marchmont, enclosed in one to her father, in which she urged her niece to consent to a scheme which Tehandar had proposed a few days before—that they should be married that very week by special license in the Episcopal church close by.

'It would be so nice,' her aunt wrote, 'for them to spend their honeymoon together in London; and although she herself, on account of the infection, could not be present at the ceremony, she would join them in town, and they would have a few delightful weeks together before they went to India.'

Avice could hardly believe her eyes as she read this unexpected letter. Opposition on her aunt's part had been the one straw to which she had

clung, and now even this had failed her! Well, since things were so, there seemed nothing for it but to submit to fate, or rather to the irresistible will of Tehandar Mutwanee.

'That girl I told you of in my last is going to be married, it seems, on Saturday,' wrote the cynical Westall to his friend the next day; 'and this is Tuesday! There seems something a little uncanny to my mind in such very quick work. Poor little Miss Sacharty—did I tell you that was her name?—she does not seem to thrive on her wooing. Let us hope matrimony may have a more salubrious effect!'

FROM THE MINT.

EVERY year a somewhat secluded Government Department, situated east of Tower Hill, officially reminds the world of its existence and of its activity. It presents to both Houses of Parliament, by command of Her Majesty, and offers to any one not within those august precincts, for a merely nominal sum, an interesting and detailed account of its doings for the past twelve months. And certainly the twenty-first Annual Report of the Deputy-Master of the Mint, just issued, in no way falls behind its predecessors in offering a striking array of facts and figures.

The first hasty glance reveals that in 1890 the good round sum of £9,460,860, 8s. 4d. has been issued to fill the purses of Her Majesty's most liege subjects. This sum comprised coins of all denominations except those little-known and perhaps less needed five-pound and two-pound pieces, which appear to have been cut off as cumberers of the ground since Jubilee year. Over six and a half million of the cosmopolitan sovereign, always and everywhere worth its weight in standard gold, were coined; beside two and a quarter million half-sovereigns, the coinage of which had been practically suspended since 1885; about a million bloated aldermanic crown pieces; and three-quarters of a million of those coins whose heraldic device was so irreverently stigmatised by the *Daily Telegraph* as consisting of a couple of kitchen poker and a tea-tray. For shillings and sixpences there was apparently a considerable demand, no fewer than 8,794,042 of the one and 9,386,955 of the other having been struck. Florins, which some people think could be dispensed with altogether, reached the comparatively small total of only 1,684,737 pieces, which is only just about half that of the half-crowns. Threepenny bits, the 'Jenny Wrens' of our coinage, swarmed to the extent of 4,470,322 pieces. While it may be information to some that silver coins smaller even than this 'wee bit o' siller' were issued from the Mint. Diminutive twopenny bits and dainty pennies (sixty-six weighing one ounce troy), with a certain prescribed number of threepences and fourpences, are distributed every Maundy-Thursday in the Chapel Royal to needy pensioners by the Queen's Almoner, and are consequently known as Royal Maundy Money. These Moneys constitute a privileged class, and seldom,

if ever, suffer the degradation of their plebeian kindred in being bartered over the counter for fat bacon or red herrings. Though sometimes shamefully prostituted to adorn the neckcloths and watchchains of a certain class of society, they are more generally acquired by enthusiastic numismatists, and allowed an unbroken and indulgent repose on the velvet cushions of their coin cabinets.

Bronze coins are in a large proportion, being nearly four-ninths of the total number of pieces (gold, silver, and bronze) coined. There is the inconceivable number of 28,718,145 pence, halfpence, and farthings bearing the date of 1890, representing a nominal value of £89,546, 15s. 5d., and a total weight of over two hundred and eleven tons. This annual coinage of bronze moneys, we are told, is unprecedented in extent since 1861-63, when coins of this description were first issued. The Deputy-Master enlivens his Report by stating that near Christmas last the demand for 'coppers'—as most people still designate those coins that have ceased to be 'copper' these thirty years—was so great that gold and silver were set aside, and the whole Mint strength concentrated upon the out-turn of pence, halfpence, and farthings. The Comptroller of the Mint adds, with quiet satisfaction, as a proof of the remarkable efficiency of his department, that in the fortnight ended 24th December 1890, no less than £20,725 of bronze coins, numbering 6,170,400 pieces, and weighing over forty-eight tons, were supplied to the London district and the provinces.

Reference is made to the abnormal issue of no less than £3,873,576 of silver coin in the two years 1889 and 1890. Its extraordinary nature is easily seen by comparison with the total issue of the previous ten years, 1879-88, which was only £7,298,240, or less than double the value in five times as long a time. These large demands are attributed to three causes: (1) The revival of trade in the United Kingdom; (2) the payment of wages in dockyards and other large Government establishments in silver instead of half-sovereigns; and (3), the arrangement by which the Mint, from the 31st of May 1889, undertook to pay the cost of the carriage of silver coin from the Bank of England to its branches and to provincial applicants.

The figures of the coinages for only the last twenty years are colossal and beyond adequate conception. The total value issued in 1871-91 was £76,051,059, weighing 4589 tons. The pieces numbered 722,503,202, thus representing an average out-turn of two hundred and forty per minute, without taking into consideration various stoppages for repairs and other reasons. Counting one hundred a minute for twelve hours every day, more than twenty-seven and a half years would elapse before the total number of coins would be reached. The value of the gold coined was £58,172,407; of the silver, £16,912,839; and of the bronze, £965,813. The coins included

were 53,200 five-pound pieces; 85,293 two-pound pieces; 43,035,103 sovereigns; 29,501,436 half-sovereigns; 3,188,592 crowns; 2,689,830 double florins; 29,244,248 half-crowns (the coinage of which, suspended from 1851, was only resumed in 1874); 44,049,060 florins; 93,574,800 shillings; 83,025,360 sixpences; 60,646,080 threepences; 456,600 Maundy Moneys; 160,204,800 pennies; 113,612,800 halfpennies; and 59,136,000 farthings. It will be seen that coins of small denominations abound most largely, for the simple reason that more are required to make up equal amounts. The demand for bronze has always been large and continuous. Since the introduction of the bronze currency in 1860, 4790 tons of pence, halfpence, and farthings, numbering 702,250,080 pieces, and of a nominal value of £2,008,623, have been supplied. And only about one-sixteenth of this amount was exported to the colonies, the remainder being distributed in the United Kingdom.

In a Report from the Mint, one would naturally expect to find some information as to the question of the recoinage of British light gold. For it has long been generally recognised that a large proportion of sovereigns, and a still larger of half-sovereigns, are below the legal current weight. Successive Chancellors of the Exchequer, who are also Masters of the Mint in conjunction with that office, have either evaded the difficult problem altogether, or suggested some such unpopular solution as clipping the half-sovereign to pay for the sovereign. The present Government, however, have made a special inquiry into the condition of the gold currency. In the early part of 1888, all gold coins taken at three hundred of the principal post-offices in Great Britain and Ireland on a specified day were forwarded to the Mint, where they were carefully examined as to age and weight. The result, together with other investigations on the same subject, was included in the Mint Report for 1889. Therein the Deputy-Master estimates that out of a total gold circulation in this country of £102,500,000, the total value of the light coins is £52,625,000, or more than fifty per cent. This shows a deficiency of £804,390, which, however, is not surprising, when it is remembered that the life of a sovereign is estimated to be but nineteen years, and that of a half-sovereign only nine; and at the same time there has been no general withdrawal of light gold for forty-five years. At any rate this experiment afforded abundant proof that prompt measures were necessary. Accordingly, the Coinage Act provided that all pre-Victorian gold should be exchanged by the Mint for its nominal value; and on the 22d of November 1890 a Royal Proclamation announced that all gold coin of former reigns would cease to be legal tender in the United Kingdom after the 28th of February 1891. The total amount withdrawn by these means was £2,468,148; and the total value of the deficiency on these coins in weight and fineness proved to be £51,299, 14s. 3d.; or a mean total cost to the Exchequer of 4.998 pence per pound sterling. At this rate the £400,000 which Mr Goschen proposed on Budget night to devote

to this purpose would cover the loss on withdrawing nineteen millions of the £52,625,000 of light gold which Sir Charles Fremantle estimates to be somewhere in the country.

THE QUEEN'S PARDON.

A DACOIT STORY.

WHEN, at the end of the year 188-, I was sent to take up the duties of Assistant-Superintendent of Police at Pyeemana, in the Hantlawaddy Division of Lower Burma, I was told before I left Rangoon that I should find there no lack of opportunity to distinguish myself; and I soon discovered how truly this hint reflected the condition of the district. The country was literally overrun with dacoits, who found it a peculiarly favourable field for their malpractices. The villages were small, far apart, and, comparatively speaking, well-to-do; roads were practically *nil*; and boundless tracts of jungle and teak-forest afforded secure shelter for the light-heeled gang-robbers who haunted them. The police garrisons were few, and consisted entirely of Burman constables, whom their lawless compatriots utterly despised.

Of the numerous gangs which lived upon the peaceable inhabitants, the largest and most mischievous was one led by a man named 'Boh Hlan.' This outlaw was a species of Burman Robin Hood, and he owed his long immunity from capture to his cheap generosity. He was the terror of wealthy cultivators whose houses were worth looting, and the unfailing friend and patron of the poorer classes. What he stole with one hand, he lavished broadcast with the other; hence information which might have enabled the police to arrest him was particularly difficult to obtain.

To compass the death or capture of this man was the chief end of my professional life during the first months of my stay at Pyeemana. For weeks together I hunted his gang from cover to cover and from village to village. Such jungle-work during the hot season is not conducive to health of either white man or native. By the time the 'rains' were due, my constables were completely worn out by the hardships of their life, while I myself was almost incapacitated by repeated attacks of fever, brought on by sleeping out in marshy jungle and living on the poorest diet. At intervals I took my men back to Pyeemana, to let them rest and recruit; but these much-needed holidays from dacoit-hunting never lasted very long. Sometimes an alarm from a remote corner of the district drew us out on a wildgoose chase; or impatient despatches from headquarters asking what was being done, and how I explained the continued paralysis of trade in my locality; or private letters from my superiors, urging me to renewed efforts, drove me out into the forests again with followers scarcely fit to carry their own rifles.

I was thoroughly sick of the whole business, and would have done anything to get rid of the perpetual worry, when I was surprised by a visit from the officer in charge of the Police Department. He had come to Pyeemana to 'inspect,' for which ordeal I was quite prepared;

but besides inspection, he came to give me new and unexpected instructions regarding the attitude I was to assume towards the dacoits.

'The Government,' he said, 'has determined to try what effect an offer of Pardon will produce on these fellows. Do you think any of those who are harrying your district would come in if promised free pardon for past offences?'

I considered the question carefully. Although we had failed to bring down or arrest any of the outlaws, we had kept them so remorselessly on the move that they had had no time to do mischief for the last two months. No man grows tired of his business sooner than an idle dacoit, and Boh Hlan had made no raids worth anything lately. I therefore answered in the affirmative. I believed many would 'come in,' if they could be convinced they might do so without fear of the consequences.

'Very good,' said my chief. 'You are empowered to treat with the dacoits in your district on these terms: full pardon to every man who has not a price upon his head who comes in and gives up his arms before the 31st July next. See what you can do.'

He went away next day, leaving me to my own devices. I cannot say I relished the idea of carrying out these instructions. I was obliged to confess to myself that with the means at my command I could make little headway against the storm of crime; but to offer free pardon looked too much like admission of disability to be palatable to me. However, the order had been given, and I resolved to turn the chance it offered to the best account.

I lost no time. I determined to begin with Boh Hlan, who chanced, quite undeservedly, not to be one of those for whose head a reward had been proclaimed. He was the greatest pest I had to deal with, and, moreover, he had his band so well in hand, that if he consented to apply for pardon I felt certain his entire following would do the same. So, an hour after Colonel X. had gone, I sent an orderly to summon the old *phoongyee* (priest) who was the sole occupant of the tiny monastery outside Pyeemana. The person of a *phoongyee* is peculiarly sacred even to dacoits; and I subjected the old man to no risk in appointing him my ambassador to Boh Hlan.

The *phoongyee* soon appeared, and entered the veranda of my house at the slow stately pace observed by the Buddhist priesthood. He had been a tall man; but now he was bent with age; and the yellow robe which had fallen from his shoulder discovered a frame as gaunt and shrivelled as that of a mummy. With his shaven head, sunken eyes and cheeks, and dry parchment-like skin, he looked a messenger more fitting to carry tidings of Death than of Peace.

Infirm though he appeared, he was still active both in body and mind; and when I had explained what I wanted with him, he readily consented to 'help the Government side.' Could he ascertain Boh Hlan's present hiding-place, and make his way thither? The old man bowed; he had no doubt he could—if he went alone. Then would he attempt it, and deliver with his own lips the message I wished given the dacoit chief? He would, certainly, if I would write the message down.

I did what he required, and begged him to go soon; and having received the old man's assurance that he would start at once, I dismissed him, praying that success might attend his mission.

How or where he found the Boh, I did not think proper to inquire; but five days afterwards, he reappeared, looking if possible a shade more withered than before.

'The Boh,' he began without any preliminaries, and in the matter-of-fact tones he might have used in delivering a casual message from a next-door neighbour—'the Boh is willing to treat with your honour, and names a place of meeting.'

'Very good!' I exclaimed. 'You have indeed done well!'

The old phoongyee smiled at me pityingly. 'Boh Hlan's words were these,' he continued: 'Tell the police officer to come and meet us at Thongway village a week hence. He must come alone and without arms. If he carries any weapon, we shall know his fine words are lies.'

I could not repress a gasp of astonishment and dismay. The phoongyee fairly burst out laughing.

'Of course your honour will not go?' he observed.

'Yes; I shall,' I replied, though my heart was beating like a hammer at the prospect of such an encounter.

'The old man may counsel the young,' said the phoongyee respectfully. 'If your honour go to Thongway, he goes to his death.'

An opinion given by this man was well worth consideration; but continued failures and official 'wiggings' had made me reckless; and I was not in a mood to listen to reason. Here at last was a chance of doing something tangible; it was literally 'neck or nothing!' but I had no idea of missing it. I therefore warmly thanked the old phoongyee for his services and his kind advice; but reminded him that if I declined to meet the Boh even on such preposterous conditions, it would produce a very serious effect on the state of the country. Would he oblige me by seeking out the dacoit leader again, and telling him I would meet him at Thongway on the day named?—My adviser flatly refused; he would help no man to his death.

'Did Boh Hlan say he would be there on Thursday?' I inquired.

'Your honour, he did; but'—

I cut the old gentleman short, and told him he had permission to go home to his monastery. This was Monday, and I had no time to waste in fruitless argument.

I did not grow more enamoured of the plan as I thought over it. Boh Hlan was a thorough scoundrel. I could not forget that I had, in our only skirmish, with my own gun wounded him in the arm; and he was not likely to have forgotten it either. But I was determined to meet him. If he consented to 'come in,' I should score a good mark at headquarters; if he played me false—

Thongway was a small hamlet of notoriously bad repute, lying under the Shan Hills, about fifty miles away. If the dacoits agreed to lay down their arms and give up their business in return for pardon, it would be no easy matter to persuade them to come in as prisoners and

go through the form of trial, as the authorities required: they would never consent to follow me back tamely on such terms. I therefore resolved to take the whole police force I had at command, encamp at a spot I knew of, about ten miles from Thongway, and bring them in under guard; always supposing they meant fair play. I did not care to ponder over the alternative.

I pass over the two days' march to the place I had selected for my police encampment. We arrived there late in the evening, very thoroughly done up by our wearisome tramp in the heat of the sun, and all hands turned in early. The following day was that fixed for the meeting at Thongway, and tired as I was, idle speculations on the task to-morrow had in store kept me awake all night. I was up at daylight, making my last preparations, and giving my sergeant orders to be carried out in event of my non-return; but I did not set out for the rendezvous until the sun was high. The residents of Thongway were to a man friends of Boh Hlan; and if I appeared first on the ground, they were not likely to lose such an opportunity of taking my head as an acceptable gift for their patron. They might have learned from the Boh that their village had been chosen as a meeting-place; but more likely not; and I preferred to run no unnecessary risks.

Giving my sergeant the only orders I could depend upon his carrying out—namely, to return with all haste to Pyemana if I failed to appear before midnight, I took my stick, filled my pockets with biscuit, and started for my destination. The country through which the path to Thongway led was very lovely; open and grassy, splendidly timbered, and wonderfully rich in orchids, whose blossoms gleamed, pink, yellow, red, and white, from almost every bough; while the darkly-wooded hills rose to a height of five thousand feet right before me. I remember the scenery now, though I did not pay much attention to it at the time. I don't think I am more of a coward than most men, but I do not mind confessing that I walked that ten miles to Thongway in a condition of unspeakable 'funk.'

I reached the belt of jungle which surrounded the village at a little distance, about eleven o'clock; and when I emerged on the open paddy-land which lay between me and the cluster of bamboo huts, I paused to pull myself together and try to discover whether the dacoits were true to their tryst. I could see no one in the village save a few romping children; but on moving a little farther to the left, I saw a crowd of men squatting in the shade of a clump of elephant bamboos, a little way on the far side of the hamlet. So far so good. I wiped the perspiration from my face and hands and strode forward. My heart sank a little lower as I drew near, for I saw that every man of the assembly was armed. That did not look as though they intended peace.

The screams of the children, frightened by such a strange monster as a white man, spared me the trouble of announcing my arrival to the dacoits. They rose with one accord and, making very unnecessary display of their *dahs* and spears, began to slouch towards me in twos and threes. I took my stand under a huge tree, and threw up my hands to show I was unarmed, according to agreement. Then, actuated by somewhat mixed motives,

I shouted in commanding tones to the advancing dacoits: 'Lay down your arms! I will not speak with any man who approaches me with *dah*, spear, or gun in his hand!'

The effect of my speech was far from satisfactory; every man stopped, paused for a moment, and then slunk back to the shade, where all sat down again. I did not like this. It denoted that the dacoits were in no good-humour, and I wished myself well out of the place. But having forbidden them to come near me armed, it would never do to retract, and I sat down on the ground to consider my next move. It was not left to me to make one. After twenty minutes of hot discussion the dacoits appeared to have formed some plan of their own. Four men very deliberately set up bamboo tripods and squatted down to rest their guns on them, in accordance with the Burman's practice when he means to take a good aim; then one man, carrying an antiquated carbine, was pushed and scolded out of the group, evidently charged with a message to me. He came very slowly, and I could see he was in a terrible fright; but I was growing painfully anxious to open negotiations, and rose to receive him, holding out my hands and trying hard not to look at those four levelled guns.

'Come here,' I said persuasively; 'I have no arms.'

The man grinned the sickliest grin I have ever seen on human countenance, and stammered out something relative to my *thaynatgalay* (pistol; literally, small gun). As well as I could make out, his friends had sent him to ascertain that I had not a revolver concealed about me. They did not believe I would come without it, and would like to be quite sure.

This was more reassuring. I held up my hands again, and begged the trembling messenger to come and satisfy himself.

'Come!' I said as persuasively as I could—'come, and look all over me.—Look! I take off my coat, that you may see I have no pistol.' I threw my *karkii* jacket on the ground and held up my hands again. The fellow took heart of grace and came nearer.

'Turn round,' he requested. 'They will shoot you dead if you kill me.'

'I can't kill you,' I replied shortly, as I turned slowly round for convenience of inspection. 'I didn't come here alone to kill any one; I came to talk to Boh Hlan about this matter of pardon.'

The man grunted an assent; and having ascertained that the bulky contents of my coat-pockets were nothing more dangerous than biscuit and cheroots, bawled to his companions to 'Come!' Those gentry then laid down their weapons and obeyed, laughing and talking with insolent defiance.

Five minutes more, and I found myself the centre of a tightly-packed crowd of squatting figures, who stared at me as though eyes could kill. I did not feel easy by any means, hemmed in on all sides by ruffians to whom murder was child's play, and whose lives I had been diligently seeking for the past five months. No attempt to hustle me was made; but the expression on every one of the lowering savage faces told how light a word, how slight a slip of the tongue, was necessary to set them at my throat. Now and again I caught some half-jeering obser-

vation as to my helpless condition there in their midst; and I was half tempted to hurl some scathing challenge to them which would ensure my death at once, and leave them an inheritance of bullet or rope. All were talking at once, to me and at me, and my patience was sorely tried before a momentary lull gave me a chance of making myself heard. It came at last after the very worst quarter of an hour I ever spent, and I made my speech. In brief, I explained the terms on which pardon would be granted; insisted strongly on the increase of the Punjaabee Military Police, then in process of organisation; reverted again to the pardon now offered, and exhorted them to take advantage of an opportunity that might not occur again.

'Now, Boh Hlan,' I concluded, addressing the leader, who was squatting almost on my feet, 'what do you say?'

The man ran his finger nervously over the unsightly lumps on his chest which marked the spots where charms had been let in below the skin, and said 'he would like to talk it over.'

'It is good,' I replied, breathing more freely. 'I am here to talk with you.'

'I have here,' said the chief, raising his arm and showing a puckered white scar, 'a wound from your gun. Moung Tsit has a wound on his leg; many of us have received hurts from the police.'

The Boh's reference to wounds was followed by a slight commotion; half-a-dozen men stood up to show newly-healed bullet-wounds, and some, hideous suppurating sores which made me sick to look upon.

'The police guns have made these wounds,' said Boh Hlan, looking at me fixedly.

My rising hopes sank to zero again. An ominous silence reigned over the gang for a couple of minutes, and I did not care to break it.

'The police guns made these wounds,' repeated the Boh as stolidly as before.

The man was evidently playing with me, or trying to work upon the vengeful feelings of his men. If I gave their resentment time to hatch, my life was not worth an hour's purchase. I felt that my voice trembled when I spoke.

'Those men who have been wounded,' I said, 'will be taken into the Government Hospital and cured. Or if they prefer it, they shall have as much English medicine as they please.'

I was unutterably relieved to see the general approval these remarks evoked. The dacoits' brows cleared, and in my heart I gave thanks for the Burman's unshakable faith in the efficacy of 'English medicine.'

I followed up my advantage by lighting a cheroot, and after taking a pull or two at it, I passed it to the Boh; he hesitated a moment, for smoking one cheroot, turn about, is only practised among friends and neighbours; but finally he accepted it, drew a full mouthful of smoke, and handed the tobacco to the man next him.

A better understanding being now established, the dacoits became anxious to hear more about the intentions of the Government. Over and over again I had to reiterate that not a man who gave himself up should have a single hair upon his head cut off; that they would be brought before the judge and pardoned without delay; and that they should have nothing whatever to fear from the police after their release; they

might live wherever they pleased and do what they liked.

After two hours' hard assertion and promise, I drew out my note-book and asked Boh Hlan point-blank if I should write down his name as an applicant for pardon. He hung back a little, but at length gave way; and soon I was taking down names as fast as I could write. I was delighted with the success of my foolhardy errand; but I was not yet out of the wood.

'Now,' I said, closing my book, 'there are still some men who have not asked to come in. I will come back to-morrow and give them one more chance.'

'Where are you going?' demanded the Boh curtly.

'To my camp, ten miles from here,' I answered.

'Are the police there?'

'Certainly.'

A loud murmuring arose from the crowd, and the Boh made no attempt to quell it. Clearly the information that the police were so close at hand disturbed them.

'See!' I shouted at the top of my voice, 'what would it matter though the police were here in this village? They will not hurt you now.'

But the alarm was not to be so easily allayed.

'You must stay here to-night,' said Boh Hlan firmly, turning to me.

'If I do not return,' I answered, 'my men will think I am killed, and will go quickly to Pyemana. The Deputy-Commissioner will then send five hundred men out after you.'

The Boh laughed. 'For how many months have you been trying to catch me?' he jeered. 'But you shall not go. How can I tell but that you will return at once with your police to-night, they being so near at hand? Now you know where we may be found, you will again try to shoot us.'

There was no arguing with such obstinate distrust as this; but the position was exceedingly awkward. I could not go without the dacoits' sanction, and to remain would inevitably bring out an expedition to avenge my imaginary murder. All I had half-done would be undone, and more besides, before matters could be explained.

'I will stay,' I answered, recognising the necessity; 'but you must send two of your men to my camp with the letter I shall write, and those two men must remain with the police as hostages.'

I was agreeably surprised by the Boh's ready consent to this arrangement; and without delay I sat down and pencilled a note to my sergeant, explaining my delay and bidding him detain the messengers.

I did not sleep much that night. I occupied a hut with the dacoit chief and a dozen of his men, who were as wakeful as I was. The outlaws talked all night about my visit to them, and the probability of the Government keeping its promise of pardon. They seemed unable to believe that it was not a ruse to make prisoners of them, and several predicted that their fate would be death or—even worse to the Burmese mind—exile to the Andaman Islands. Some boldly voted that I should be killed as I lay (supposed) asleep, and that an attack should be made on my police camp. This suggestion found several supporters, and for an eternity I lay listening while my fate was shuttlecocked to and fro. In vain I listened for

Boh Hlan's voice; either he was asleep, or held aloof from the debate, for he did not speak a word until, in the advanced hours of the morning, a hot dispute began between some of his band regarding their conduct on the following day. Then he delivered his own decision, straightforwardly enough.

'Silence, you!' he cried. 'Listen! This English police officer is alone, and he cannot take any man against his will. Those who like may run away. I believe the Englishman has spoken truth, and I shall follow him to Pyemana. Those who will may follow me.'

Not another word was said; and worn out with anxiety and fatigue, I fell asleep.

I was up at dawn, eager to start back to camp before the dacoit chief should change his mind. I found that five of those who had promised submission had thought better of it, and had bolted; but Boh Hlan and twenty-seven of his men professed themselves ready to accompany me. I was a proud man when I marched into my camp at the head of this file of dacoits.

I need not linger over the sequel. The gang gave up their arms and assumed the rôle of prisoners with a good deal of murmuring; and their reproaches did not decrease when they were committed to the lock-up to await their formal trial. That ordeal took place almost immediately, and they were set free on promising to be of good behaviour for the future.

The impression this treatment made upon them was evidenced in a remarkable manner. Within a month of their dismissal, pardoned, no fewer than eighty-seven dacoits came in voluntarily and gave up their arms. Thus my trip to Thongway bore fruit more valuable than I in my most sanguine moments ever dared anticipate; but I should not care to go through the experience again.

JULY.

LIKE a fairy enwreathed with the blossoms
That sprang from the footsteps of June—
Like a queen from the realms of the rainbow
Engirdled with rays from the moon—
July comes when the sounds are entrancing
That are borne on the breast of the breeze,
Her glances the hills are enhancing
That smile on the seas.

Beams in beauty the dell and the dingle,
The upland, the garden, the lawn;
Pink flowerets peep up from the shingle,
When wavelets sing welcome to dawn;
And the rocks that for ever look leeward,
Like sentinels guarding the land,
Rejoice when the sun from the seaward
Engoldens the strand.

Her evenings are moonlit and starry,
The hills are in purple of kings,
Tall trees like true knights seem to tarry
Till July her royalty brings.
'Mid the scenes of her wealth let us linger,
And list to the harp that is strung,
Which when July hath touched with her finger,
The aged grow young.

A NOTABLE HOROLOGICAL INVENTION.

THE Naval Exhibition now open in London contains many interesting relics of other days. To the makers and users of nautical instruments, and to horologists especially, there are exhibits which have a peculiar interest attaching to them. Among these is John Harrison's famous 'Time-keeper,' in view of the unique character of which a few remarks relative to it and its maker at this time will be of special interest, the more so, perhaps, that little information of either of them seems to be possessed by the general public.

It is well known that every ocean-going vessel is equipped with the means of enabling those in charge to direct its course, and also to determine its geographical position at sea, and that one indispensable factor in the latter problem is a time-keeper, or, as it is otherwise called, a ship's chronometer. This, however, was not always so. The route of the earlier navigators across the trackless ocean was not by any means the 'beaten track' it is now. The time has been when a deviation of a few score miles more or less in an ocean voyage was not considered a bad course. Horological science, though of ancient origin, had not, previous to the later half of the seventeenth century, produced any portable timepiece approaching anything like exactness, the erratic performances of all then existing rendering them quite useless for any practical purposes of navigation.

Though Harrison's 'Time-keeper' marked the commencement of a new epoch in horological productions, it is open to question if, without the labours of those who preceded him, his fame as a watchmaker would have been what it is. This is not to be understood as depreciatory of his talents as a mechanic and scientist, for these were without doubt unsurpassed by his contemporaries, but merely as an example of the great law of development.

With a compass, to denote the Poles, and the celestial spheres for his latitude—or distance

north or south from any given place—the ancient mariner, previous to the discovery of America, seems to have had all that he required; at any-rate, it was not till after this event any steps in quest of additional methods are recorded.

The discovery of the New World in the fifteenth century soon caused the problem of the longitude at sea—or distance east or west of any given place—to become a very important question amongst transatlantic voyagers, and forthwith great rewards were offered from time to time by the Governments of various maritime nations for the invention of a method or construction of an instrument to effect that object. Some most absurd projects were offered by those whose learning ought to have guarded them better. Alchemists and other visionaries of that day sought with crafty schemes to obtain the rewards. But the true solution of this great problem could only come from the sound deliberations of the mathematicians and astronomers, who recommended a reliable timekeeper for this purpose. So far so good; but theory without means for its practice availed nothing.

Horology in the sixteenth century had no instruments of sufficient accuracy to offer, and at that time not the least indications existed that it ever would. The Spanish Government for a period of over one hundred years offered and expended vast sums of money in the pursuit of determining the longitude at sea, till about 1626, when they appear to have abandoned the attempt. The Dutch, also, who possessed in those days a splendid fleet on the high seas, and were correspondingly interested, were prominent in the attempt, and at one time offered thirty thousand guilders. France, too, joined in the same search, and offered great sums. These continued rewards elicited many ingenious schemes; but none of them possessed sufficient merit.

But the dawn of better things was at hand, and a step taken in 1656 was the prelude to a series of experiments, which a hundred years later culminated in a success as complete as it was astonishing. This step was the attachment of the

pendulum to the clock by the Dutch philosopher Huygens, and was an immense acquisition to horology, at once giving it a place in the exact sciences such as it had not before held. The clock thereupon became in many astronomical calculations as indispensable as the telescope, and every practical astronomer has since then become more or less of a horologist.

The next important advance was the invaluable invention, about 1660, of the watch balance-spring, by Dr Robert Hooke, the son of a watchmaker in the Isle of Wight, and a most ingenious mechanic. He was also the author of other valuable inventions and improvements; notably the 'anchor' escapement for clocks, now in common use, the germ of the duplex escapement for watches, and some ingenious tools for the making of astronomical instruments.

Previous to the year 1691, watches had only the hour-hand, a disadvantage which was removed by Daniel Quare of London, who added the minute-hand, an improvement apparent to all.

Nine years later, the horizontal escapement in its perfected state, by George Graham, F.R.S., the pupil and colleague of the renowned Thomas Tompion, and sometimes styled the 'Father of English Clockmakers,' was made public; and if not the most accurate, is still made on account of its economy in almost countless numbers. Till the appearance of this escapement in 1700, there was no other in existence—with the exception perhaps of some obscure experiments—than the old 'vertical,' now known as the 'verge' escapement. In the same year the ingenious device of jewelling the parts most subject to wear was introduced into this country by 'M. Facio, a native of Geneva, who came to Paris with this art as a secret; but not being well received, either by the Duke of Orleans, at that time Regent of France, or by the watchmakers there, he repaired to London with it, which was at that time a school where the art of watchmaking was more cultivated than at Paris.'

With these explanations, we now come to the year 1714, when the English Government appointed a Commission for the purpose of investigating the longitude question. One of the members of this body, which was known as the Board of Longitude, was the celebrated Sir Isaac Newton, who prepared an exhaustive paper on the subject, and endorsed the old opinion that a 'true time-keeper' would solve the question. This recommendation was laid before Parliament, and shortly afterwards there was published 'An Act for providing public reward for such person or persons as shall discover the longitude at sea.' Sir Isaac, who was himself deeply interested in horology and in touch with all the latest improvements, was evidently sanguine that a true time-keeper *could* be made, provided the incentive was strong enough to induce any one to devote his time and means to that end. So the reward

was fixed at ten thousand pounds if it defined the longitude to within one degree; fifteen thousand to within two-thirds; and twenty thousand to within half a degree—these distances being respectively, sixty, forty, and thirty geographical miles. At this time, there were then living several eminent horologists, whose well-known abilities, one thinks, might have induced them to claim this honour; yet there is no authentic record of any application till fourteen years after it was first offered.

John Harrison, who invented and made the time-keeper which gained this reward, was born at Foulby, near Pontefract, in Yorkshire, in 1693. Of his early life little seems to be known, further than that he assisted his father, who was a joiner and cabinet-maker; and in addition to this occupation, undertook the repairing and cleaning of clocks and watches. From this fact, it is no doubt traceable that his son John had his great mechanical abilities directed into the channel by which he in after-years made himself famous. When quite young, he seems to have been an enthusiastic worker amongst clocks and watches, and is said to have made some of the former with 'frames of wood.' Although this indicated his constructive and imitative faculties—which in mechanics are indispensable—yet his fame rested on higher attainments than these alone, for, in addition to them, he possessed inventive powers of the highest order, along with a logical mind; and as a scientist in all that related to horological philosophy, his productions are a monument to his talents.

The mere making of the separate parts of a watch or clock does not constitute a time-keeper. Each article is subject to its own laws, which were only understood by a long series of observations and experiments. The expansion and contraction of metals through changes in temperature, the varying fluidity of the lubricant, magnetic disturbances, irregular supply of force to the escapement, want of isochronism in the pendulum and balance-spring, were all elements of disturbance, and to counteract these was the life-work of John Harrison.

It is beyond the scope of this article to give a technical description of his inventions; the principles involved, and his intricate mechanism, make even the attempt at anything like lucidity a hopeless task; and in view of this, the remarks thereon must needs be confined to their popular aspect. Harrison, who was twenty-one years of age when the decision of the Board of Longitude was made public, was then, or soon afterwards, engaged in devising some means to counteract the expansion and contraction of metals by heat and cold, and his efforts were crowned with success by the production of his 'gridiron compensation pendulum.' The reward offered seems to have directed his attention to remedy the same defect in a watch, which defect, in long voyages embracing wide ranges of temperature,

was one of its greatest failings. With this view, then, he prepared drawings of a scheme, including an original escapement, took the same to London, and there showed it to Dr Halley, who was then Astronomer-royal. In principle, the invention depended on a laminated bar of brass and steel fixed at one end, the free end carrying two curb pins embracing the balance-spring; and according as the bar shrunk or expanded, it regulated the length of the spring. It acted, in short, as an automatic regulator. It has since been entirely superseded by more exact methods.

Dr Halley, seeing there was something in the invention, gave its author an introduction to the practical George Graham, who advised him, before applying to the Board for assistance, to get his machine constructed. This was in 1726; but it was not till 1735 that any real success attended his efforts. A time-keeper which he then tested against motion at sea in a river-boat on the Humber answered his expectations so well, that it was taken on a voyage to Lisbon, thus testing its powers of resisting both motion and temperature. The experiment was attended with most gratifying results. For this, the Board advanced him five hundred pounds; and he was advised by them to make another, but on a smaller scale. In 1739 he appeared before the Board with his second instrument; but, for some reason or other, it did not meet their approval. After the lapse of two years he was back before the Board with his third time-keeper, much smaller, and greatly improved; and for this he received the gold medal of the Royal Society.

In 1758 Harrison applied to the Board of Longitude for permission to have his instrument officially tested by sending it to sea in a vessel bound for a voyage that would try its capacities in all conditions. After a considerable and quite unnecessary delay, this was granted; and on the 18th of November 1761, William Harrison, the inventor's son, was despatched with it to Jamaica in the good ship *Deptford*. After being eighteen days out, the vessel, according to the then usual method of determining the longitude, was found to be thirteen degrees fifteen minutes west of Portsmouth; whilst, according to Harrison's time-keeper, it was stated to be fifteen degrees nineteen minutes, a difference which the ship's navigators were not disposed to admit. Young Harrison, however, having confidence in his 'watch,' stoutly stood by its accuracy, and maintained that a certain island would be sighted next morning if it was properly defined on the chart. The captain, to settle the dispute, steered a course necessary to that end; and next morning, to his chagrin and Harrison's joy, the 'watch' was up to time. The same results were obtained as island after island was passed; and on their arrival at Port Royal, after a voyage of over two months, the time-keeper was found to be five seconds slow; and on its return to England, after being away over five months, its error was not a minute and a quarter.

Now, according to the Act of 1714, Harrison was justly entitled to the full reward of twenty thousand pounds, as his instrument had defined the longitude to a point considerably less than the least distance specified by that Act. But Dr Maskelyne, who was afterwards the Astronomer-royal, through some freak, would not consent

to its being paid; besides, some of the other members of the Board thought this astonishing accuracy was merely accidental. It was at length agreed to give an advance of two thousand five hundred; but on Harrison justly remonstrating, this sum was doubled, and the balance promised when all doubts were at rest.

A second voyage was then directed to be made; and on the 24th of March 1764, William Harrison again left the shores of his native land on board the man-of-war *Tartar*, bound to Barbadoes. Every precaution was taken this time that foresight could suggest to prevent misunderstanding. The instrument was placed under three locks and keys—one being kept by Harrison, another by the captain, and the other by the navigating officer, so that, when it required winding, all three were bound to be present. On its return in September of the same year, its performance was found to have quite realised the expectations of its maker. The Board then paid over another five thousand pounds, withholding the balance till he had given full instructions to enable it to be reproduced. Larcum Kendall, who had been an apprentice of Harrison's, accomplished this; but he refused to commence without a sum of four hundred pounds being paid to him in advance.

After several years of delay and many acrimonious discussions with the Board, John Harrison finally in 1767 received the balance of the twenty thousand pounds. He was then in his seventy-third year. His time-keepers, which are still in existence, are the property of the Government, and are officially in charge of the Astronomers-royal in Greenwich Observatory.

DUMARESQ'S DAUGHTER.

CHAPTER XXXIII.—A NEW SUITOR.

TIME marched on, as indeed it often does in this prosaic world of ours; and Psyche's life at the Pension des Orangers grew daily more and more like her life at Petherton. The first flush of freshness in the African world wore gradually away; and even as it disappeared, Psyche's eyesight returned once more to something the same deplorable condition as at the Wren's Nest. Only, a general dimness began at last to supervene. Instead of periods of occasional loss of sight, interspersed with periods of perfect vision, Psyche was conscious of a constant decrease in visual power, so that she only saw with clearness and distinctness now when she made a definite effort of attention towards any particular object. The fact was, the change was but evanescent. The cause of her malady still remained untouched. Her sight was failing.

She passed much of her time all those days with Geraldine Maitland: much also with Cyrus, Sirena, and Corona. Geraldine, indeed, did all she could to throw the four together. The girls, she thought, were nice lively companions for poor broken-hearted Psyche: they roused and stimulated her: and Geraldine even cherished some faint hope that Cyrus's good-nature and kindness

of heart might at last engage Psyche's passing interest. For Geraldine had a genuine affection—of a sort—for Cyrus: knowing his profound admiration for 'high-toned' Englishwomen, she would have been delighted—if only she could have handed him over to Psyche.

With this end in view, she had concocted from the beginning a little scheme of her own to create in the genial young American's mind an interest in the pretty and shrinking English girl. Before the Dumaresqs' arrival, she had arranged with Cyrus that he should pay nearly one half their bill at the *pension*, in the utmost secrecy; and so had created a proprietary feeling by anticipation towards both father and daughter in the generous Westerner's chivalrous soul. For Cyrus, though engaged, like all the rest of Cincinnati, in the fluctuating concerns of the wholesale pork market, had a nature as tender as any English gentleman's: and his feeling of protection towards Psyche might easily ripen under these peculiar circumstances into one of a far more intimate and personal kind.

As for Geraldine, her own attitude towards her American admirer was very peculiar. She liked Cyrus immensely; but, as Cyrus himself rightly divined, the money alone stood in the way. She could never endure the world should think she had sold herself for Cincinnati gold. A little wholesome opposition, indeed, on Mrs Maitland's part might have worked wonders for Cyrus's chance of success; but Mrs Maitland, sharp woman of the world as she was by nature and training, was yet not quite sharp enough to perceive that opportunity for carrying her point. Her tactics had less of finesse about them than of sheer persistence. She saw her end clearly, and made for it with most unwomanly directness by what seemed to her the plain straight path. And Geraldine, who could be led but could not be driven, found her mother's advocacy of Cyrus's claims a considerable factor against the honest and manly young American's chances.

A month or two had passed, and Sirena sat one day in the garden on the hillside slope under the pleasant shade of a drooping pepper-tree. The full African sun was pouring down his splendour on terraces rich with rose and geranium. Tall irises flaunted their beauty in the air, and bees hummed busily around the heavy-scented loquat trees. Psyche and Corona were seated on the bench in the tennis court below, watching a set between some others of the visitors: for the irrepressible Briton, wherever he goes, *must* have his tennis lawn. Sirena laid down her novel with a yawn. A shadow from behind fell across the path. She looked up suddenly. It was Haviland Dumaresq.

The old man seated himself by her side with a fatherly air. He had learned to like Sirena by this time; she was always so kind to his precious Psyche. When Psyche's eyes were most seriously affected, it was Sirena who came to her bedroom to read to her: when Psyche couldn't see to guide a pen, it was Sirena who helped her to write her letters. Haviland Dumaresq could pardon for that even Sirena's name; no siren she, indeed, but a simple-hearted, kindly-natured, rough, self-satisfied, self-sufficing Western girl. Besides, was

she not Cyrus Vanrenen's sister; and were not Haviland Dumaresq's ideas for the moment beginning vaguely to fix themselves upon Cyrus Vanrenen's future? Anything on earth, now, to turn the current of Psyche's mind into fresh directions!

'My darling grows no better, Miss Sirena,' he said pathetically, as he glanced at Psyche sitting with that settled resigned air of hers on the bench far below. 'I had hoped much from this trip to Africa. Every day I stop here my hopes grow slenderer. As the novelty palls, the evil increases. She's fading like a flower. I know not what next to try to rouse her.'

Sirena glanced back at him with tears in her eyes. 'Do you think she'll go blind, then, sir?' she asked anxiously.

'Unless we can change the set of her thoughts,' Dumaresq answered in a very slow voice, 'purely functional as the evil is, I begin to fear it. An effort would suffice to make her see as well as ever, to be sure; but she seems incapable even of making that effort. Her will-power's gone. She lacks initiative. She has nothing left to live for, I'm afraid, just now. I wish to God we could find something to interest her in life. At her age, such a want of living-power's simply unnatural.'

'That's so, sir,' Sirena answered, half afraid, for she could never quite conquer her instinctive terror of the famous thinker.

'You know the cause?' Haviland Dumaresq suggested tentatively.

'I guess so, in part,' Sirena answered with what might (for an American girl) be almost called timidity. 'Miss Maitland's enabled me to draw my own conclusions.'

Haviland Dumaresq paused for a moment, irresolute. Then he went on dreamily, in his half-soliloquising fashion: 'It would be a great thing, though, if we could make her take some living interest in something or somebody else, instead of leaving her to this perpetual brooding over her buried grief.'

'It would so,' Sirena assented eagerly.

Dumaresq started at the cordiality of this assent. Her tone, he felt sure, said more than her words. She had thought it over—thought it over before. Here surely was an ally—a ready-made ally. If only the current of Psyche's thought could be turned! It wasn't only for her happiness nowadays, alas! it was for her eyes, her sight, her health, her very life almost.

'Nothing will ever give her a chance now, I fear,' he said slowly, still fixing his gaze on Psyche in the distance, 'except the slow growth of a fresh affection. It would have to be slow: it would have to be long: it would have to be all begun from without: for Psyche herself, in her present frame of mind, would never begin it. She's lost the impetus. Her heart's too much bound up now in that unknown grave.—But if anybody should ever happen to fall in love with her, and to press his suit upon her by gentle degrees—she's young still—nature and instinct are all on her side—it isn't natural at her age to grieve for ever—well, I almost fancy, he might have a chance—he might yet prevail upon her.—And if, however slowly, Psyche could only be brought to feel that some new object in life was dawning on her horizon and growing up before

her, her eyesight, I believe, would at last come back. All the doctors are agreed as to that: all she needs now is power to make the effort.'

Serina looked up at him with a vague wistfulness. 'If Cyrus'—she began: then she broke off suddenly, appalled to herself at her own exceeding boldness.

Dumaresq interrupted her with a sudden return of his native haughtiness. 'Mr Vanrenen,' he said, drawing himself up as if he had been stung, 'is a very young man for whom I have slowly conceived—well—a certain regard, in spite, I will confess, of some initial prejudice. But I most assuredly didn't intend, in what I have just said, to allude either to him or to any other particular person. If you thought I meant to do so, you entirely misunderstood me. It is an inherent, perhaps an ineradicable, vice of the feminine mind always to bring down general propositions to an individual instance.'

He said it in his grand impersonal kingly manner, like a monarch in his own philosophic realm, dismissing for the moment the *pourparlers* of some friendly power on a matter affecting his daughter's interests. His condescension was so evident, indeed, that Sirena herself, unabashed wild Western American that she was, felt constrained to answer humbly in her smallest voice: 'I beg your pardon, Mr Dumaresq. I—I didn't know what I was going to venture to suggest would be likely to offend you.' She was awed by the solemn dignity of the old man's attitude. In her own heart, she felt tolerably sure he meant to hint, in his obscure way, that if Cyrus made love to Psyche, he, for his part, would have no serious obstacle of his own to offer. But she also felt that, penniless and aged as the great philosopher was, a cipher in the worldly society of rank and wealth, he still considered and knew himself a power in the world—a power of a kind that could hardly bear to stoop to the vulgar trivialities of Cincinnati pork-merchants. And he made Sirena recognise his position too. That frank and fearless young daughter of an irreverent dollar-worshipping Western republic yet recognised in her own heart, as she sat there that morning under the weeping pepper-tree, that the gray philosopher in the threadbare coat would be conferring an undoubted honour on her house if he were to admit, however grudgingly, and with whatever reserves, that Cyrus Vanrenen might conceivably pay his court unopposed to so great a lady as Haviland Dumaresq's daughter.

The old man rose, as if to conclude an interview that embarrassed him. Sirena rose too, and moved towards the court, where Psyche was sitting. At the self-same moment, Cyrus and Geraldine Maitland came in sight from the opposite direction.

Cyrus was in a humour particularly disposed to think and hear anything good of Haviland Dumaresq and his daughter; for in truth he had just been conferring a favour upon them. Geraldine had called on her weekly errand of paying the other half of Mrs Holliday's bill, for which Cyrus unobtrusively supplied the money. To him, it was nothing—less than nothing, for he was really one of the richest men in Cincinnati: if out of the superfluity of his wealth he could do anything to make Haviland Dumaresq or his daughter the happier, he was ready

with all good-will to do it, not letting his left hand know what his right hand was doing. Americans are more public-spirited in the use of their money than we are; and Cyrus took to himself no special credit for this graceful act. Society and the world, he had been told, owed Haviland Dumaresq an immense debt: and part of that debt, by the favour of circumstances, he, Cyrus Vanrenen, was privileged to discharge for it. It was one of the many advantages of wealth that money could so bring him into pleasing personal relations, however one-sided, with his natural betters.

Psyche, looking up, was dimly conscious of somebody approaching. She moved aside a little, and made room for the young man on the bench. Cyrus noted the natural courtesy with keen pleasure. She wanted him to sit beside her, then! And she so very high-toned! Such a singular honour from Haviland Dumaresq's daughter!

They sat and watched out the set together, Psyche seeing nothing, and Cyrus talking gaily enough to her about nothing in particular. Yet, she listened gratefully. The full-flowing murmur of his trivialities soothed her. Mr Vanrenen was always so kind and nice: she liked him so much for his simple good-nature.

As they sat there talking idly, Corona brought out a letter with an American stamp on it. Cyrus tore open the envelope and read its contents with a faint puckering of his eyebrows.

'Business slack?' Corona inquired with obvious interest.

'Well, the old man writes, the market's feverish,' Cyrus answered with a faint flush of ingenuous shame. He had never felt ashamed of pork in his life before—in Cincinnati, pork is as fashionable as cotton in Manchester or cutlery in Sheffield—but in Psyche's presence he was vaguely aware of something ludicrously commonplace about that Ohio staple. To hide his confusion he murmured once more—'East-bound freight-rates restored from Chicago.'

'Is that so?' Corona cried, with much meaning.

'That is so,' Cyrus replied; 'and what's more, Futures in lard are described as nervous.'

'You don't tell!' Corona murmured sympathetically. Like all Western girls she was a born gambler. She had ventured her own little pile on Futures.

'Yes, I do,' her brother responded: 'and there's a Corner in December ribs and sides, too: a very dangerous Corner. January opened at 160, and without once receding from that first figure, touched as high at times as 172. "The determination to carry the February squeeze through to the bitter end," Eselstein says in his letter, "makes operators apprehensive of what may occur with deferred deliveries." It's awkward—very.'

'And what'll Mr Eselstein do?' Corona asked, drawing a deep breath.

'Why, I guess the old man'll back the Fifth National Bank blind,' Cyrus answered, smiling. 'He's bound to go it with such a squeeze as that! It's neck or nothing.'

To Psyche, all this was Greek indeed. Squeezes, and Futures, and Corners, and so forth, meant less than nothing. They were talking, to her, a foreign language. Yet she felt vaguely for

all that she was *de trop* just then. She rose, and tried to grope her way blindly to the house. Cyrus, rising at the same moment, led her up to her father at the door of the *pension*. 'Thank you,' she said, turning round to him with rising tears in her eyes. She was really grateful for all these little kindnesses. Cyrus opened the door and ushered her in with a bending head. He looked after her, admiringly, as she felt her way with outstretched hands through the darkling passages. Poor little lady! He would do anything to serve her. She was Haviland Dumaresq's daughter—and so very high-toned!

On the steps, Sirena met him with a hushed face. 'Cy,' she said, looking up at him, 'do you know what Mr Dumaresq told me just now? He told me you were a young man for whom he'd conceived quite a regard!—I assure you he said so.—And I think, Cy,' she went on after a short pause, 'you ought to accept this intimation, and make the best of your position with Psyche.'

Cyrus pondered. 'What'd Geraldine Maitland think?' he said at last, thoughtfully.

Sirena rose to the situation like a born diplomat. 'Why, Geraldine Maitland said to me to-day,' she answered, with deep wisdom, "'What a pity Psyche don't take a fancy to that dear fellow, your brother!'" That's exactly how she said it. And my advice to you is, go in and try for her, Cy. It's something, you know, to be Haviland Dumaresq's son-in-law.'

'They'd stare some in Cincinnati,' Cyrus admitted, stroking his nascent moustache reflectively.

'And you like her, you know, Cy,' his sister continued, returning to the charge and following up her advantage. 'You must allow you like her. I can see every day you like her better.'

'Well,' Cyrus admitted in an apologetic voice, 'it don't seem natural I shouldn't like her, either—being thrown together with her so much, and she so high-toned. Her very misfortunes make a man somehow feel like loving her. If it weren't for Geraldine Maitland'—

'Geraldine Maitland!' Sirena cried scornfully, interrupting him with a contemptuous twirl of her graceful fingers. 'Well, Cy, I'd have thought even you'd have seen Geraldine Maitland don't sit on the same rail with Psyche, anyway. And ever since Psyche came to the house, you've been getting to think more and more of Psyche, and less and less of Geraldine Maitland.'

'That's so, too,' Cyrus assented unreservedly after a moment's thought. 'That's good psychology, as Mr Dumaresq would say. It's no use crying for the moon, you see, Reeney. So I don't deny, one scale's been going up, and the other down, ever since Miss Dumaresq came here.'

'Very well, then,' Sirena said with an imperious air. 'Let 'em balance straight, and go ahead, Cyrus. Just you catch on to Psyche, now you've got the chance, and don't go crying over spilt milk any more with Geraldine Maitland.'

Her advice seemed wise. So for the next three months, accordingly, Cyrus Vanrenen was Psyche Dumaresq's most devoted slave. The simple-hearted, generous, whole-souled young American, having once taken her up, fell easily in love with her, if indeed he hadn't been more than half in

love with her already. He had really persuaded himself now—so blind is youth—that if Psyche could only love him in return, her eyesight would soon come all right again, as the doctors assured them. And for the next three months, with this object in view, he waited upon her as assiduously as her own shadow. As for Psyche, she, poor child, accepted his gentle squiring, all unconscious of its aim, yet not without gratitude. A hand to guide her was a comfort in these dark days; for Psyche herself never doubted now the terrible truth that the end of it all must be total blindness.

Yet when Sirena told Geraldine Maitland the result of her little plot upon Cyrus's heart—a plot already concocted between them in strict confidence—Geraldine's face, to her surprise, fell somewhat. She stifled a sigh, like a woman that she was (and therefore illogical), as if it hardly pleased her to hear that the lover she had taken such pains to shuffle off could give her up in favour of Psyche quite so readily.

(To be continued.)

THE PRAIRIE DOG AS A PET.

ABOUT five years ago a couple of prairie dogs were brought over to our rural parish in the south of Scotland from Colman County, on the basin of the river Colorado, Western Texas. The surface of the prairie-lands in that quarter, which is now being occupied as large sheep-farms, is either nearly level or slightly undulating. In an extensive district, Santa Anna, the highest eminence, only reaches two or three hundred feet in height. The region is fairly open country, here and there a short scrub. It is a flowery land in spring, after which the grass grows high; and if drought set in, there is danger of it taking fire. The climate is so warm and salubrious that for a great part of the year the shepherds can sleep out of doors with immunity. In this region the prairie dog is very numerous; nor is it much liked, for the holes it burrows often trip up the horseman at night. It is frequently to be seen sitting upright near its burrow, barking in its own way at the stranger. Then it bolts, tail quivering, headlong into its hole, turns itself, and peeps out as the wayfarer approaches, thus giving animation to an otherwise lonely region.

Our two prairie dogs were brought over to this country in boxes, and were far from being in good condition when delivered from the irksomeness of confinement. The house into which they were received as lodgers is a humble dwelling of two small apartments, close to the church and churchyard, and occupies the middle of a small row or hamlet. Their appearance was a subject of great curiosity, being somewhat like that of a squirrel, and somewhat like that of a water-rat. They were not so large as a rabbit; had short forelegs, small tails, no external ear, were pretty broad for their length, had long claws, and soft hair, short, and of a dull red colour, which changes to a gray hue. They were very playful with each other, and made excursions to the churchyard, the grass of which they

seemed to enjoy, plucking it out with their fore-paws, and then sitting eating with the greatest avidity that portion of the stem least coloured, nearest the root. At the end of a year the older of the two died. He was supposed to be two months old when first caught. Our remarks now mainly concern the younger and stronger one, Yap, which is still alive and lively, being now at least six years old.

The great trouble with them was to keep them from gnawing the mats, rugs, bed-hangings, and furniture of the kitchen in which they were located. For this purpose they required to be locked up at night. A strong box was procured, provided with a lid that could be locked down. A partition was made in the middle of the box with a hole in it, so as to give each an apartment. One side of the box was made of strong wire; and the wood of the other sides and of the lid lined with perforated zinc. A motley quantity of rags was procured, and they were allowed to make their own beds. It was observed that the stronger of the two mainly occupied himself in arranging the patches within the box, while the other carried them from the floor. An empty tea-chest containing some newspapers was also placed at their service through the day. This was set in the dark under the bed. To this day, Yap objects to newspapers, which he turns out, much preferring the woollen rags. A singular fact in regard to the arrangement of the particoloured patches may be noted. In arranging them, the brighter colours are always turned to the surface, and the red rags are more exposed to view than those of other colours. It takes Yap a long time to make up his bed; but he does it neatly, keeping a hole in the middle, into which he plunges and covers himself well up. When tired, he goes to bed in the tea-chest for an hour or so throughout the day, but likes to get into his strong box near the fire at evening. If the lid be closed, he becomes restless, scrapes at it, stands on his hindlegs, and plucks at the clothes of his friends. His time to go to bed, even when the days are long, is very nearly about the time of Texan sunset, seven or eight o'clock.

Although West Texas is a sheep-country, the shepherds employ no dogs; they trust to stone and sling. When a sheep inclines to bolt from the main flock, they dexterously throw a stone right before, which causes the runaway to back into the herd. The slinging is accompanied by shouting, and by-and-by the sheep understand the shout without the stone. This may account for the fact that Yap has never shown much timidity towards dogs. The dogs, on the other hand, generally bridle up, however loud and swift the assault, whenever they come near him, as if they noticed something uncanny. In Texas there are a few wolves, now getting very wary, and several rapacious birds, having far less fear of man than those in this country. Perhaps that is the reason why Yap is much more terrified for a crow than a dog, and runs quickly into the house if one or more alight in the tree opposite and begin to caw.

With regard to sounds, Yap is capricious, and can never endure that of a barrow passing, although no notice is taken of that of the church bell. His food is strictly vegetable and his diet

light. Dry oatmeal, a bit of oatmeal cake, and oats, are his favourite food. He likes milk, but can never be induced to take porridge. He does not object to fruit, and is particularly fond of almonds. The average temperature of this country being so much lower than that of Texas causes him to be extremely anxious of creeping close to the kitchen fire, where he sits close to the cat, which he fondles, bestowing on her many gentle strokes with his little paws. When out of doors, he is particularly fond of keeping close to the little bantam hen. Of the two persons with whom he resides he prefers the mistress to her husband. Nevertheless, the mistress having left for some time, he sat close to the feet of his male friend at night, and did not wish to go to bed until the master retired to his as far on as eleven o'clock; and, strange to say, when, after a few days' absence, the mistress arrived, it took her some time to regain his affections.

Although his ancestors never were domesticated, he seems capable of a certain amount of training. One strange peculiarity of both dogs was that they lacked the sense of vertical distance. When they got on a table, chair, or window-sill, they stepped from them and fell as if unaware, hurting their face and nose. When they attempted to leap from two chairs a bit apart, they would also miscalculate, and fall between them. They soon got over this, and judged the distance horizontally correctly; but it was a long time before Yap could do the same from a height. Now, however, experience has taught him this also, and he can leap from box to chair, from chair to bed, and *vice versa*, with the utmost precision. Perhaps the nearly level nature of their original habitat may have something to do with this blunt sense of vertical distance.

Yap has intelligence enough to notice any strange piece of furniture or utensil brought into the apartment, never being satisfied until he has smelled and examined it. Once when a new rug was put down before the fireplace to grace the ministerial annual visit, he sat down on it with great enjoyment. But when the old faded rug was again laid, resentment was shown, and he began to gnaw and tear it. The indomitable habit of gnawing is in the way of any of his kind being made a household pet. Even the perforated zinc of his strong box gave way before his incisors, and he succeeded in making a hole through the lid. Here, also, he has learned by experience; and if caught in the act of gnawing any household article, instantly stops, lest a hard word or a cuff should be administered.

He expresses his affection mainly by pressing gently with his teeth the hand of him he loves. If a stranger lay hand on him firmly, he shows no resentment; but should he touch him in a timid hesitating way, he is apt to give him a pinch. Yap, after his companion's death, grew much more timid about going out of doors, and never afterwards ventured as far as the churchyard in which the two together used to play.

During the last nine months Yap has fallen off considerably. He now weighs two pounds, is nine and a half inches in girth, and from the snout to the tip of the tail fifteen inches long. Within the last three months he has developed a taste for meat, which he begs for, holding up his forepaws, and prefers cooked to raw. In this

summer weather he gratifies his instinct, filling up holes with earth, and beating it in with his head as, in the wild state, his kind seal up rattlesnakes should they enter their funnel-like burrows.

THE ROMANCE OF A SUMMER.

CHAPTER IV.

JACK D'ARCY was a universal favourite, and in that respect he differed considerably from his chief friend, Oliver Westall, and closely resembled Humphrey Standish. Perhaps that was the reason why Humphrey singled him out from among all the other guests at Mr Campbell's shooting-box as the one whom he chose chiefly to honour with his society. However that might be, before they had been a week at Inverarran they were the closest of friends, and felt as if they had known each other all their lives.

'Odd thing, isn't it? how different some people's destinies are from what they ought to be,' said Mr D'Arcy one evening, as he and Humphrey sat talking together in his room after they had retired for the night. 'Some people, whom to look at you would say were born for happiness and prosperity, are just the unluckiest beggars on the face of the earth, and *vice versa*. There's a case in point,' he went on presently between the whiffs of his cigar, finding that Humphrey did not answer, 'in something my friend Westall told me in a letter the other day. He says there's an awfully charming girl staying in the hotel he is at—a perfect marvel of everything that's charming, according to him; indeed, if it weren't old Oliver, I should declare that he was in love with her himself. And now, this priceless paragon, this goddess in human form, is going to marry a wretched old foreign fellow—a Malay, or something of that kind—a chap whom everybody seems frightened of, and whom she herself, according to him, detests, or at anyrate does not care two pins about. Now, what the dickens does a handsome girl—one who could marry whom she chose and when she chose, want to go and tie herself for life to a man who isn't even an Englishman—or even a European, but a wretched Oriental, brimful, doubtless, of deceit and underhand ways? Pah! the thing makes me sick.' And he looked very much disgusted.

Humphrey did not say anything. He was thinking of Avicé's mother.

'I only knew one Malay,' his friend resumed, 'and he was a scoundrel. An out-and-outer, I can tell you. His name was Mutwanee, and I never had such a desire to see a fellow-creature hanged as when I was talking to him. He came over in the ship I came from the Cape in, at the beginning of this month—or, rather, it was the end of last. I shouldn't wonder if this were the same fellow,' he added, meditatively; 'and if so, I pity the girl. He has two or three wives already.'

It was growing too late for any more conversation just then; but the next morning, after breakfast, D'Arcy joined Humphrey on his way up-stairs.

'It's the queerest thing I've heard for long,' he cried, glancing at an open letter in his hand. 'You know that fellow Mutwanee I was talking of last night. Well, it seems that he is the very fellow whom this Miss Sacharty is to marry. I wonder her people'—

'Who did you say the girl was?' interrupted Humphrey hoarsely, clutching as if for support to the balusters. 'Miss who?'

'Sacharty,' rejoined the other, startled by his voice and manner; then, catching sight of his white face, he added: 'Why, Standish, man, what's up? You look as if you were going to faint!'

But Humphrey by a supreme effort managed in a great degree to regain his self-composure. 'I'm all right,' he returned. 'But, come in here; I want to hear all I can about it.'

With a rueful thought of the shooting he would miss, Jack followed his friend into the deserted smoking-room and told him all he knew. It did not amount to very much after all, being merely the little scraps in Oliver Westall's letters; but it was enough to draw a low groan of horror from the startled and dismayed Humphrey.

'It is some fiendish plot of her father's,' he cried fiercely. 'Av—Miss Sacharty could never, never have consented to such a thing of her own free will!' Then, after a moment's pause, he went on more calmly: 'Does your friend say whether her aunt knows of it? Is she also in the game?'

'No,' returned D'Arcy, glancing at the letters in his hand; 'there is nothing about an aunt, only a note that the girl herself is a half-caste.—But if you know the aunt, you might be able, if not to stop the marriage at once, at least to delay it till she comes. And remember, I know for a fact that Mutwanee has at least three or four other wives. There was a fellow on board who knew him very well, and I daresay we could get hold of him somehow as a witness. He knows all his past history.'

'Ah,' returned Humphrey gravely, 'I think then I'll go off to the nearest town and telegraph to Miss Marchmont—fortunately, I know her address—and then I shall be able to decide on my course of action. To-day is Thursday, so there is no time to be lost.' Then, after a moment's pause, he added apologetically: 'I'm afraid I've spoilt your day's sport for you, old fellow! What a nuisance you must think me! But you see—I know Miss Sacharty very well, and the thought of her danger!' He broke off abruptly and covered his face with his hands.

D'Arcy looked compassionately at him. 'Never mind the shooting, old man!' he returned with attempted levity. 'Those other chaps can't bring down *all* the partridges, you know. And I tell you what, I'll come down to the town with you; the walk will do me good!'

Humphrey pressed his hand gratefully, and hastily putting a few things into his travelling bag, in case of having to go to Strath Carron, he set off with his friend.

'We'd better stay here till the answer comes, I think,' remarked D'Arcy as they turned away from the telegraph office. 'There will be more chance of a speedy answer then.'

It was not until the afternoon that the reply came, however. Humphrey tore it open with

trembling fingers, scarcely daring to read the scrawl on the pink paper inside. D'Arcy impatiently looked over his shoulder.

'Come, cheer up, Standish!' he cried cheerily; 'the old lady's on your side at anyrate!' And thus encouraged, Humphrey read the message, which ran as follows: 'Delay marriage. S. no power over A. Am starting directly. Rely on your help.'

'Well, now, as you've got your bag here, I think your best plan would be to go off at once to Strath Carron, and, armed with this warrant, to beard the lion in his den.' And D'Arcy set his face in the direction of the station as he spoke.

Humphrey followed him. 'Yes, that would be best,' he returned; 'there's no time to lose.'

There was no train to Strath Carron till eight o'clock. 'And you won't get in till latish, I should say, sir,' continued the station-master in reply to his anxious question. 'The quick trains are all in the forenoon.'

'What time will I get there if I go in the morning?' inquired Humphrey quickly.

'Well, sir, ye'd maybe get there about ten o'clock, if ye took the quarter to seven. That's the best train o' the day; it disna stop but twice on the road.'

'I think I'll wait for that,' said Humphrey, turning to his friend. 'I can't do any good arriving in the middle of the night.'

'It widna be before twelve o'clock,' put in the station-master by way of comment.

'And it might do harm,' continued the young man, not heeding the interruption, 'by putting them on their guard.'

D'Arcy acquiesced in the wisdom of this argument. 'Shall you stay in the town for the night, then?' he inquired as they left the station.

'Yes, I think so. It would be awkward coming in so early, wouldn't it? But I'll walk a bit of the road back with you.'

And they turned away together into the quiet high-road which led to Inverarran.

'It's awfully good of you to have helped me so!' cried Humphrey, when at length they parted. 'I should never have known about it if it hadn't been for you!'

'Pooh! my dear fellow, it was nothing,' returned the other, giving his hand a hearty shake. 'I hope I'm not such a monster as to see a girl sacrificed when I can help her.'

'Poor fellow!' he muttered to himself afterwards as he watched Humphrey's tall form fading away in the distance. 'He's very hard hit, and no mistake.'

The quarter-to-seven train amply justified the station-master's boast, and punctually at ten o'clock Humphrey stepped out on to the bare-looking station of Strath Carron. The hotel—there was only one of any repute in the place—was not far from the station, the porter said; and it was without much difficulty that he found himself at last at its door.

The waiter assured him that Miss Sacharty—he had not dared to ask for her father—was up-stairs; and up-stairs he accordingly went, and, motioning aside the obsequious waiter, entered the room before which he had stopped. Avice, who was seated in a low chair by the window,

raised her head listlessly as he entered; then seeing who it was who had thus invaded her solitude, she sprang up with a little cry of joy. 'Mr Standish!' she exclaimed, advancing quickly towards him—'Mr Standish!'

Humphrey noted with distress how white and fragile she had grown, and how hot was the little hand which he held so tenderly in his. 'Miss Sacharty!' he said sorrowfully, 'what have they been doing to you? You look like your own ghost!'

A sad little smile crossed her face. 'It is nothing,' she returned, with attempted lightness, 'nothing at all. I am quite well.'

'Quite well!' he echoed reproachfully. 'Why should you pretend to me, your old companion of so many delightful weeks, that you are quite well, with a face like that! I suppose next you will say you are quite happy!'

The girl's lip quivered at his words, but she determined to put a brave face on the matter. 'I ought to be,' she returned, her trembling voice belying the words. 'Don't you know that I'm engaged?'

'I have heard so,' he returned gravely; 'but I cannot and will not believe that it is by your own free will. Tell me truly, now, it is not so?' He looked at her eagerly, imploringly, but with a quiet steadfast faith in his own assertion that seemed for the time to nerve her enfeebled will.

'No,' she replied, in a low tone, so low that he could scarcely catch the words—'no, it is not by my own free will.'

'I knew it, I knew it!' he cried joyfully. 'But tell me, how could any one persuade you to take such a step?'

Slowly, bit by bit, with an effort which showed how strong was the influence Mutwanee had upon her, she told him the story of the past few weeks; and ere she ended, Humphrey had decided on his course of action.

'Is your father in?' he inquired abruptly, as she finished speaking. 'No? And Mr Mutwanee?'

'He is out too.'

'Good. Then don't let either of them know I'm here. Remember, whatever that fellow asks you about me, you are to tell him nothing. And be assured whatever happens I will save you!' With these words he left her, and went in search of Mrs Douglas, with whom he had a long and earnest conversation, at the end of which it was agreed that Humphrey should lie perdu in the town until the next day, and that he should allow the marriage to begin before he appeared to stop it. 'Otherwise, they may escape us yet,' he added oracularly.

There were not many people in the hotel who knew of the tragedy which was being enacted in their midst. Sacharty was very close about his private affairs, and Mutwanee had his own reasons for wishing to keep things quiet. The wedding was fixed for eleven o'clock, an hour when most of the visitors were at the baths; and when the time came there were few in the little church beyond the bride and bridegroom themselves. Of course Oliver Westall was there; he considered it his duty to 'see the last of that poor little girl;' and the Digby Brownes had also turned up; but beside them there was no one.

As they walked up the silent aisle, Mrs

Douglas noted how anxiously Avice's eyes glanced from side to side in search of Humphrey; and on pretence of arranging her collar, she managed to whisper: 'It will be all right—only trust.'

The girl answered by a grateful smile, and the ceremony began.

The clergyman, a nervous little man, had concluded the general exhortation, and was beginning the particular charge to the betrothed couple to declare if they knew of any lawful impediment to their marriage, when steps were heard coming quickly up the half-darkened aisle, and Humphrey's voice rang out clearly in Avice's ears and in those of all present: 'This marriage must not proceed.'

The words fell like a thunderbolt on all except Avice and Mrs Douglas, who had been in a measure prepared for them. The timid little clergyman dropped his book in terror and gazed at Humphrey, who was followed by two constables, much as a pigmy might look at a giant.

Sacharty was the first to recover himself. 'Must it not?' he inquired sneeringly; 'and why, pray?' Then, recognising Humphrey's face, he continued with exaggerated politeness: 'Perhaps, Mr Standish, you will be good enough to explain the reason of this most unwarrantable intrusion.'

Without deigning a reply, the young man turned to the clergyman. 'I come,' he said quietly, 'on behalf of Miss Sacharty's legal guardian, to stop this marriage as an iniquitous and illegal affair. This person'—indicating Mutwanee, who stood erect and defiant, evidently determined to brazen matters out as best he might—'this person is not a Christian, and has, as can be proved if necessary, several wives already in his own country.'

Timid little Mr Strachan looked horrified, and edged farther away from the foreigner.

Humphrey meanwhile had given his constables instructions to detain the two confederates, and then taking the trembling Avice by the hand, he led her away, leaving Oliver to take charge of Mrs Douglas.

But Mutwanee had no intention of submitting to his fate without a struggle. Twisting his supple form out of the detaining grasp of the constable, he drew a revolver from his inner pocket and levelled it full at his captor. The constable, quick as thought, sprang aside, and the contents of the chamber were lodged in the heart of the wretched Sacharty, who fell back without a groan. The other constable, thus released from guard, advanced swiftly towards the Malay, who was preparing for a second shot, and suddenly wrenching his weapon from his grasp, slipped a pair of handcuffs on him, and, assisted by his comrade, marched him off to the town prison, there to await his trial for murder and attempted bigamy.

It was with difficulty that Humphrey succeeded in conveying Avice back to the hotel, for the poor girl's nerves were so shaken by what she had gone through that she could hardly stand; and when at last they did gain the hotel hall, she looked so dreadfully ill that he was fain to relinquish her into the hands of Mrs Douglas, who insisted on sending her at once to bed.

As he stood watching her feebly mounting the stairs, Andrew touched his arm. 'Beg pardon,

sir,' he said; 'but there's a telegram come for you a while since;' and he handed him a salver with an ominous-looking envelope on it. Humphrey opened it hastily. It was from Jack D'Arcy. 'Aunt telegraphed, coming Strath Carron this morning about twelve.' It was then about a quarter to.

'Thank goodness!' he exclaimed, replacing the paper in its envelope—'thank goodness!' Then turning to Andrew he said hurriedly: 'Just tell Mrs Douglas that I am going to the station. I shall not be long.'

The waiter turned to execute his order, and he set off.

The train was late, as trains generally are when one wants them to be punctual, and it was fully a quarter past twelve ere it steamed into the station. There were very few passengers for Strath Carron, and Humphrey easily distinguished Miss Marchmont's spare form among them. She looked anxious and troubled; but a smile of genuine pleasure crossed her face as Humphrey greeted her. It changed to a look of alarm when he told her how dreadfully upset Avice was; and as soon as they reached the hotel she rushed up-stairs to see her darling niece. Avice was tossing about in a restless sleep, talking fast and almost incoherently as she turned from side to side. Mrs Douglas sat watching her with a troubled face, which, however, brightened as Miss Marchmont entered. She felt that she could now shift part at least of the responsibility of the nursing on to her.

And a heavy responsibility it was; for the doctor, whom Miss Marchmont had at once summoned in her alarm, declared that the girl was suffering from an acute attack of brain fever, induced by the excitement of the past few weeks, and he could not say what the end might be. 'She may recover,' he said doubtfully as he went down-stairs with Miss Marchmont the next day. 'Yes, with care she may recover; but I tell you frankly that I fear the worst.'

As a rule, Dr Forsyth was a hopeful individual, who preferred looking on the bright side of things, and thus his ominous words struck a chill into the hearts of Miss Marchmont and Humphrey. The latter was hanging about the hall, as he usually was, waiting for the slightest news of Avice; and he walked to the end of the road with the doctor when he departed, trying to win some 'crumb of comfort and hope from him.

When he returned, he found that a messenger had arrived from the police court with a polite request from the superintendent that he would come and speak to him on a matter of grave importance. Sick at heart he set off, and when he got there he learnt to his horror that Tehandar Mutwanee had been found dead in his cell that very morning. A post-mortem examination had been determined upon, as they could find no visible cause of his death. 'And I thought,' continued the official blandly, 'that you might know something of the deceased's habits, something that would give us a clue to work upon.'

But Humphrey knew nothing, and so was suffered to depart. A few days later he heard that the doctor's report had been 'Suicide by poison.' But he did not pay much heed to the matter, for both he and Miss Marchmont were

too much occupied with anxiety about Avice, who was hanging between life and death.

As the doctor had predicted, she had a hard fight for life; but at last, though as weak as a child, she was pronounced out of danger, and entered upon her long convalescence.

It was months before she regained anything like her old health and spirits, and for long the least allusion to the events of September upset her so terribly that the subject was never mentioned. At last one day, of her own accord, she asked where her father was; and then Miss Marchmont gently told her all, and how she need never fear Tehandar Mutwanee again. There was a short pause, and then she went on hesitatingly: 'What was that letter you talked about so often in your illness, Avice, one from me sanctioning your marriage?'

Avice looked puzzled for a moment, then she said: 'Oh yes! I remember.' And for the first time her aunt heard the story of the letter. 'I felt as if my last hope had gone then!' the girl added as Miss Marchmont stroked her wasted hand thoughtfully.

That lady did not speak for a few moments. 'I did not write it,' she said at length quietly. 'Kilmur must have forged it himself.'

And then, since he was dead, and they were loth to speak ill of him, the subject was dropped for ever. Humphrey coming in a little later, found Avice alone, for Miss Marchmont had suddenly recollected an errand she had in the town; and there, in the quiet light of the spring evening, he told her how he loved her; and hand in hand, the glory of the setting sun lighting their faces with its dying rays, they plighted the troth which was to last 'till death us do part.'

MEMORANDA OF AN INVALID.

How many of my readers are acquainted with the sensations of broken and resumed consciousness? On a certain Sunday I went to my usual place of worship, got out my books required in the service, took my seat in my usual corner, heard a small portion of the singing, reading of Scripture, and prayer; and then—I opened my eyes, and lo! I was lying on my back, and the kindly face of my old friend and trusted doctor was bending over me. I said: 'Where am I?' He said: 'In your own library.' All the interval was an absolute blank. Not mist, or fog, or dark night, but uncompromising nothingness, lasting some four hours.

I am told I answered questions on my way home in the ambulance. I am sure that those who say so would not tell fibs, and I can therefore say that something inside me answered the questions for me. I didn't, for I wasn't there. 'Master's out, but we expect him back shortly.' When master came back, he had to be introduced to a 'transmogrified' room. In every piece of furniture there seemed to be a kind of suppressed smile, as if it would say: 'How do you like the look of us now?' Then came the introduction to the trained nurse, a matter in which I hope every afflicted reader of mine will be as fortunate as I was. The comfort of being kindly attended to, and every want or medical direction observed, by a quiet, vigilant, cultivated, educated woman,

who knows exactly what to do and how to do it—one who can talk or read when required, or be quiet if she sees it best for her patient—is so great, that one parts with her at convalescence as a regretted friend. Such, at all events, was my lot. And such nurses should be treated in the family as they deserve. We have known wealthy families who have had no more sense of propriety than to send up scrappy meals to the nurse in a fashion likely to deprive her of what appetite she might possess after fulfilment of her disagreeable duties. In one case a visitor at the house was so disquieted by her host's behaviour that she bought a salt-cellar for the nurse, that condiment having been previously sent up-stairs, I believe, in a piece of paper. We will not enter so far into further particulars as to enable the family to be identified. For ourselves, the nurse had her meals with us, and was a pleasant guest.

Sometimes these trained nurses have to display considerable resolution and moral courage. Our nurse had been recently attending a young lady, whose father, an elderly and crotchety man, had peculiar doctrines about carpets and blinds. He would not have them himself, nor permit them to any one of his household. The patient was suffering from some pulmonary or bronchial complaint, and nurse asked for these needed protections from cold. The autocrat replied: 'I must inform you, nurse, it is a fixed rule of mine that no room in my house shall have carpets or blinds.' To which nurse sturdily replied: 'Then I would have you understand, sir, that I am going to *break* your fixed rules.' And break them she did, despite of the old fellow's persistence and hectoring.

The focus of the invalid's day is of course the doctor's visit. The patient has to be got ready for the doctor. His temperature is ascertained and registered. His face and hands are washed and his hair brushed by the kindly nurse in a way that pathetically stirs up very old recollections of a 'vanished hand,' a mother's hand, in the days of 'long long ago.' But in comes the doctor. 'Well, nurse, and what have you to tell me?' The sagacious nurse in reply tells the equally sagacious doctor as much as she thinks proper in the patient's hearing. The patient has got his little speech ready concerning his aches and pains and his queer sensations, real and illusive (and how queer they can be, when the nerves resolve to have a spree!). The patient, then, after the pulse has been allowed to tell its own story, tries to peep under the doctor's mask to find out what he thinks about the case. It is not well to question your medical man. If he has pleasant news to tell you, he will be quick enough to disburden himself of it. Take your medicine when nurse gives it. Do as you are told and be at rest, as far as your complaint will allow. That is your share.

There are topics of transcendent interest that we cannot dwell upon in a secular journal. We may perhaps be allowed to say that those who have looked far enough onward and upward to be prepared in health for the gravest issues of disease, will find, as the weary head sinks back on the pillow, too weary for thought, that they have already within them a priceless medicine, which cannot be bought at the chemist's, a

celestial anodyne like the blue sleep whereof we read in *Realms*. It was 'a pulpy substance of the most beautiful blue colour,' the finest quality exhibiting a 'choice cerulean blue, which produced the most profound and absolute repose.' The author of *Friends in Council* forgets, however, to give us the address of the vendor of this heavenly jelly. I will venture to say it is only efficacious when home-made. But the recipe is well known to all my readers.

Another discovery that is made by a man who is dangerously ill is, that he is more kindly and generously thought of than he was at all aware. When a man is unmannered by illness and his nerves are jarred, he is allowed now and then to hide his face in his handkerchief, in the instinct of concealing a tear or a sob. And a very frequent incentive to this weakness arises when sickness and peril make breaches in the wall of British reserve, and the invalid is allowed to see a portion of what is usually relegated to the funeral day and the epitaph, and to learn that his depressing under-estimate of himself, and of his little utilities, services, and kindnesses, is—or seems at least, to some sincere friends—not the whole of the truth.

Finally come convalescence and 'the garish light of day,' business, and care, and strife. But he has come within sight of the great Exit Gate, and he is never quite the same man again.

THE MONTH:

SCIENCE AND ARTS.

DR HICKSON'S lecture upon Animal Life on Coral Reefs, delivered at the London Institution recently, dealt with a very fascinating subject. The lecturer asserted that marine animals of all kinds congregate in even greater abundance than is usual in tropical seas in the region that extends from the growing edge of a coral reef to a depth of some ten or fifteen fathoms beyond it. This may possibly be due to the fact that in this region there is plenty of light and heat, and a more or less constant temperature, while there is a plentiful food-supply brought in continually by tidal currents. Many of the animals are protected and concealed by pronounced marks and colours. Besides the numerous sponges, corals, molluscs, &c., which are attached to the reef, and which creep but slowly from point to point, there are numerous swimming animals capable of active movement in pursuit of prey, which must be considered as part of the fauna of the reef. It would seem clear that the animals are marked and coloured because they may match the brilliant surroundings of the reef, and most of these protective tints must be looked upon as concealment colours. A curious feature of this colouring is that the fish in which blue is the prevalent tint are more common in the shallow water, whilst those in deeper water are more frequently red and yellow. It is surmised from this that the blue colour may be a protection for the fish from air-breathing enemies, such as eagles, ospreys, and hawks, and as these depredators can only see their prey from above, the protective colour is confined to the upper portion of the fish. The red and yellow colours which adorn their lower

parts seem to be a protection from animals which approach the fish from the deeper waters beyond the reefs—sharks, perch, and other carnivorous creatures.

A Cold Saw for the purpose of sawing iron and steel has been invented by the General Manager of the Homestead Mills of Messrs Carnegie Brothers & Co., Pittsburgh. This saw is said to be a great success, and is creating much interest among metal-workers. The instrument consists of a circular saw of fine steel of hard temper, which is ground slightly thinner at its central portion, so as to clear a deep cut. Unlike the ordinary circular saw, it is not a fixture, but travels along towards and through the metal which it has to separate. The saw runs at slow speed in a tank of alkaline solution, made up of soap, soda, lard, oil, and water; and the greatest care is necessary in regard to the quality of the material of which this solution is compounded. The cold saw gives a clean cut, and is suitable for severing any thick masses of metal such as armour-plates, &c.

A novel prize competition has been inaugurated by the Dutch East India Government, who offer a prize of ten thousand guilders—about eight hundred and twenty pounds sterling—for the best method of packing salt applicable to that substance as sold in Dutch East India on account of the Government. This Government salt is prepared in much the same way as salt used to be procured in our own country—namely, by evaporation in open salt-pans. This product, after being dried for some time by the heat of the sun, remains in the warehouses for about twelve months. The product is a rough salt, which still has a tendency to absorb moisture from the air and to deliquesce. The method of packing for which the prize is offered must comprise a material which is not acted upon by the salt; and which must not contaminate it in any way, or confer upon it any peculiar taste or smell; at the same time it must possess sufficient firmness for the salt to be kept packed in it for at least two years. The boxes, or cases, must be constructed to hold a definite quantity of salt; and when once closed the contents must no longer be liable to deliquesce. Those who wish to compete for this prize should send in their answers to the Colonial Office at the Hague before the 1st of September next, and some time afterwards opportunity will be afforded to those offering likely solutions of the problem to take part in a competition, in which they can demonstrate the working of the plans which they advocate.

A curious accident recently happened at the terminal office of the New Anglo-French Telephone. One of the officials wishing to communicate with the London office, had rung the telephone bell, and had received the reply signal, when, as he took up the receivers and put them to his ears, he received a shock of electricity of such power that he was thrown backwards and rendered for the moment insensible. Similar accidents, it seems, have before occurred at this same telephone office, and they are attributed to lightning striking the telephone wire, either on the French coast, where the submarine cable ends, or at the terminus of the land wire in Paris. It is said that such accidents could easily be prevented if lightning-conductors were fixed at these points to protect the telephone cable.

For some time past swallows have been trained successfully to do the work of carrier-pigeons. M. Desbouvrie, who has been training these birds at Roubaix, believes that in case of war they would be ten times more useful than pigeons, as he finds them to be more intelligent; they also fly at a higher altitude, and are able to obtain their food while on the wing. In a recent experiment, fifteen of these birds were given absolute freedom, when they flew in different directions, and in about twenty minutes came back and perched on their trainer's hand.

At a recent meeting of the Royal Meteorological Society, Mr A. W. Clayden described some experiments which he had made during a London fog. These fogs, as we all know, were very prevalent in February last; and Mr Clayden spent some time in endeavouring to produce that curious phenomenon known as the Spectre of the Brocken. This, we need hardly mention, consists of the greatly magnified shadow of a man thrown upon mist by the action of the sun. The London fog provided the necessary misty atmosphere for Mr Clayden's experiments; and, in the absence of sun, he used a steady lime-light placed a few feet behind his head, whereupon his own shadow was projected on the fog. He not only made careful measurements of the size and distance of the ghost, but he actually succeeded in taking some photographs of the phenomenon.

At the same meeting of this Society, Mr Shelford Bidwell exhibited a new experiment which showed the effect of an electrical discharge upon the condensation of steam. In the first place, he cast the shadow of a small jet of steam upon a white wall, showing that this shadow was of feeble intensity, and neutral with regard to colour. But when the steam was electrified, the density of its shadow was at once much increased, and its colour became orange brown. This change is explained by the theory that the electrical discharge promotes coalescence of the minute particles of water contained in the vapour, and drops are thus formed which are large enough to abstract the more refrangible rays of light. It is thought possible that this explanation may account for the darkness which so generally accompanies the approach of a thunder-storm, as well as for the yellowness with which the atmosphere for the time seems contaminated.

Mr Edison has done so many wonderful things that it is perhaps natural that he should occasionally be credited with extraordinary exploits for which he is not in any way answerable. An account has recently been published in many of the papers of a machine attributed to the great inventor, and called the Kinetograph. This appears to be a combination between the phonograph and the photographic camera; and it is said that by its means it will be possible not only to register the various sounds at the performance of an opera, but also at the same time to procure a number of successive photographs of the action on the stage. These photographs—taken at the rate of forty-six per second—would be registered on a travelling band of sensitive pellicle, and afterwards, by means of a projecting apparatus of the magic-lantern kind, would be thrown successively on a screen, while at the same time the phonograph gave up its records.

In this way it is said that an entire operatic performance could be reproduced at any time for the delectation of the eye and ear. Those who know anything about the present capabilities of the phonograph and photographic apparatus will know that whatever may be possible when instruments can be perfected, there is at present no reason to believe that the Kinetograph or any other instrument like it can do what is described. In connection with this matter it may be stated that an instrument of this character was patented in England so long ago as 1889 under a somewhat similar name, and it may be the case that this contrivance gave rise to the report to which we have adverted.

A paper was lately read at the meeting of the Shipmasters' Society, London, by Captain Carmichael, on the subject of Liquid Fuel for Ocean Steamers. The lecturer remarked that the use of oil-fuel had not been much taken up by the owners of steamships, partly because coal was cheap, and partly because there was a timidity to adopt the liquid fuel. The advantages of the latter were many, the fires being completely under the control of the engineer on watch, who could regulate them so as to produce any pressure of steam required without being dependent on his firemen. But the great advantage in the use of oil was that the fuel could be carried in space that was now practically wasted—namely, the cellular bottoms of the ships or in the ballast tanks. The consumption of oil was, weight for weight, one-half that of coal; and the storage was both more compact and easier of access. Tank-steamers could always fuel a fleet of vessels even in heavy weather, and the oil is safe on board ship, and can be easily stored on shore. It greatly added to the cleanliness and the comfort of passenger ships, and it could be adapted to any existing boiler either afloat or ashore.

The *Lancet* lately called attention to the subject of mushrooms as food, and the risks of mistaking the poisonous kind of fungi for those which are edible. It points out that it is a matter of great importance that the public should be informed as far as possible of the main qualities which distinguish the two kinds of fungi. But to give a precise definition would be no simple matter. It may be said, however, that as a rule the poisonous fungi are associated with a high colour, scaly or spotted surface, and tough or watery flesh; while the edible species, on the other hand, are seldom highly coloured, scaly or spotted; are usually white or brownish, and brittle on fracture. The poisonous varieties, moreover, generally grow clustered on wet or shady ground; while the edible kinds grow in the open, and generally in dry pastures. As a general rule, those fungi which have a bitter taste, or which burn the throat, or yield a pungent milk, as well as those which on bruising assume various tints, ought to be avoided. The note concludes with the caution that all plants of this class readily undergo decomposition, and should, therefore, in any case be eaten as fresh as possible.

The question, What is the state of the interior of the earth? has always been a fascinating one, which geology has only partly answered for us. Our knowledge of this subject may possibly be increased by a boring which is now being made

at Wheeling, West Virginia. It seems that a well has been driven there to a depth of over four thousand feet, the object being the discovery of petroleum or natural gas. During this boring, a dozen thick veins of coal have been passed, while both petroleum and gas have been struck but not in paying quantities. Gold quartz, iron ore, and other minerals have also been brought to the surface. Great interest has been taken in this boring by the officers of the Geological Survey at Washington, and the boring is to be continued under present auspices until it reaches to the depth of one mile. After this, the Government will take up the work, and the drilling will be continued into the earth as far as practicable, not for the procuring of any particular natural product, but for scientific purposes, and in order to ascertain the thermo-metric and magno-metric conditions.

It is well known that many substances have the property of phosphorescence after exposure to sunlight, and M. Becquerel, the great French scientist, who lately died, made a study of this interesting subject, and gave a list of substances which showed this remarkable property. But as early as the seventeenth century, Robert Boyle called attention to the fact that a diamond will phosphoresce simply by the heat of the hand, and that it will emit light on being rubbed. Some recent experiments made by Mr Kunz, a well-known expert in diamonds in New York, show that all diamonds will emit light when rubbed in the dark on cloth or metal; and it is believed that this property may prove of great value in distinguishing between the true diamond and other stones which imitate it. It is pointed out that the phenomenon is evidently not of an electrical nature, or it would not show itself when the stone is rubbed on metal.

A year or two ago, iridescent glass was commonly seen in our shops, and was welcomed as an agreeable novelty; but in reality there is little novelty about these colours on glass, for if we examine the specimens of ancient glass which are to be found in our various museums, we see that the material is frequently more iridescent than in specimens of modern manufacture. Mr G. M. Hopkins has made a microscopical examination of some of these ancient glasses, and has described and illustrated the results he obtained in a recent number of the *Scientific American*. The examination showed that the surface of the glass is covered with extremely thin transparent laminae formed by matter which has been gradually dissolved from the glass itself. These films are so thin as to float in the air when detached from the surface of the glass, and the colour is produced by interference due to reflections from their front and rear surfaces, by exactly the same law as causes a thin film of oil on water or a film of air between two plates of glass (Newton's rings) to give similar vivid tints.

A French scientific paper describes a platinum mirror which has the peculiar quality of both transmitting and reflecting light, and a formula is given by which the platinum solution for deposition on the glass can be prepared. A mirror of this kind placed in the panel of a door will light up a corridor or dark room,

on the other side forming a mirror; so that any one standing on the platinised side can see through the glass without being himself seen.

That compound of collodion and camphor which is called celluloid is now used for a great many purposes, its most recent employment being, perhaps, for making flexible films upon which photographic negatives can be taken instead of upon glass. It is said that an Austrian chemist has recently discovered a substitute for it, called Hyaline, but which does not possess its inflammable quality. The new material is described as being transparent, tenacious, grainless, and without smell; and it may be drawn into threads or rolled into films. It is said to be composed of different gums, resins, oil of turpentine, and gun-cotton.

The Photographic Society of Great Britain lately organised at their rooms in London a small but very interesting Exhibition. This consisted of specimens of prints in colours, illustrative of the application of photography to chromo-lithography and other processes. The specimens shown did not profess to be anything but examples of the methods with which photography can be wedded to colour by mechanical means, and they may be described as showing the nearest approach—that is possible under existing conditions—to the solution of the problem of photography in colours. Many of the examples shown were equal in effect to fine water-colour paintings; and it may be added that the prices asked for them indicated that the process of manufacture must be both complicated and expensive.

Until we remember the vast extent of Australia, which is twenty-six times the size of Great Britain and Ireland, it is difficult to realise that a large portion of the island remains blank so far as exploration is concerned. This is of course principally due to the circumstance that the central part of the island is to a great extent waterless and sterile. An important expedition was organised in April last to explore thoroughly the unknown regions of the country, and we may therefore hope that the geographical blanks may soon be filled up. Great results are anticipated from this expedition, which has for its leader a well-known Australian explorer, Mr David Lindsay. The expedition includes forty-four camels with Afghan drivers and a native guide. A recent number of the *Proceedings of the Royal Geographical Society* states that the land to be explored mostly lies to the west of the overland telegraph line. One is a tract of country thirteen hundred miles long by three hundred and fifty broad; another measures nine hundred miles in length by two hundred in width; and a third, in a more northerly direction, is a district four hundred miles by three hundred, lying between the telegraph line and the Victoria River.

It is stated that in certain parts of Hankow there is no regular coinage, and that commerce generally is in a most primitive condition. Silver is used as a medium of exchange in the large towns, and for this purpose is melted into lumps weighing about seventy ounces each, the purity being of variable quality. A certain amount of copper coin is current; but its great weight limits its use, and the credit of the native bankers

is not sufficiently established to give any extended currency to notes issued by them. Under these circumstances, opium is found a convenient material in facilitating the exchange of commodities, although pure barter prevails to some extent. The opium has the advantage of being light and portable, easily divided into small pieces representing different values, while at the same time it is universally in demand.

For many years past a register has been kept at the Royal Observatory, Greenwich, of earth-currents. Registration is effected by means of reflecting galvanometers which cast pencils of light upon a sensitive photographic surface covering a revolving cylinder. Within recent months, certain variations have been noted which could not at first be accounted for, but which are now attributed to the working of the electrical railway between London Bridge and Stockwell, a line three miles in length. It is found that the time of disturbance of the earth-currents agrees closely with the hours fixed for the runnings of the trains. It is noteworthy that this source of electrical disturbance is about six miles distant from the Greenwich Observatory.

TOO LATE.

THE barque *Eagle* lay in the London Docks, taking in the last of her cargo and getting ready for sea. It was mid-day, and a pleasant lull had followed the din and turmoil of the morning. The huge steam cranes on the quay-side were at a standstill, their suppressed vitality showing itself in little puffs of steam that escaped with a hissing noise from the safety-valves. The ring of the calking hammer was hushed for a while. Stevedores, riggers, painters, and carpenters had gone ashore to dinner, and the half-dozen hands left aboard were gathered for the same purpose in a snug little cabin on the maindeck just forward of the charthouse. Ben, the sailmaker, in his canvas jacket, was a prominent member of the group. He was a man in the prime of life, with a pleasant look on his sunburnt face. His heart and soul were in his calling, for his experience dated from boyhood, and he had a way of telling things that was racy of salt water.

The conversation had turned from the business in hand to the latest bit of shipping news, the loss of a well-known London trader, that had that morning been posted at Lloyd's as missing. Many were the reminiscences brought up by first one and then another touching the skipper and crew of the ill-fated vessel.

'D'ye think there's any chance that some of 'em may ha' bin picked up?' asked one.

'No, I don't,' answered Ben, 'and that's the truth. I'm afeard it's the old story of death in an open boat, if any of them got away from her at all. And that reminds me of something that happened about two years ago, which maybe none of you have ever heard, but which is as true as we're a-sittin' here in this cabin.'

I shipped (said Ben) from the port of Hull

aboard the *Queen of Kent* for a round voyage to Hong-kong. She was one of the 'Bell' Line, and a smarter craft I never wish to sail aboard of. She was well found too, gear, stores, and everything. Well, we made a fast passage out, with fair weather; but because we wanted to be first home, from the time we dropped the pilot until we crossed the line it was altogether different. For days at a time we lived in our oilskins, you might say; the hatches were battened down, and the fo'c'sle was awash. South'ard of the Cape we ran into the worst gale I think I was ever in in my life; and I'm sure o' this, that not many a craft would ha' lived through it. For three days we were hove-to under close-reefed tops'ls, with the wind howling and roaring through the riggin' till it seemed as if every stick must go, and the seas tumblin' over the fo'c'sle and quarterdeck as if they meant tearin' the craft plank from plank. However, she came through it with no worse loss than a set of tops'ls and courses. After that we had a brief spell of better weather; the sea dropped, and the skies cleared, and we were able to make a bit more sail. Well, just about that time, we were washin' decks one mornin' at daybreak, when the second mate, who had the mornin' watch, sings out to one of the lads: 'Go below and fetch the glasses out of my cabin.' Away he goes, and presently comes up with a pair o' these here opera-glass things.

We didn't take much notice o' this, for we thought perhaps he'd sighted a sail in the distance. But after a long look ahead, he calls out again: 'Bo'sun, just take a look through these and tell me if you can see anything ahead yonder. Wait till she dips again! Now! about two points off the weather-bow, low down on the water.—What do you make of it?'

'I see somethin' away there, sure enough,' answers the bo'sun after a pause, 'and looks as if it were about midway between the bow of the ship and the horizon; but I can't rightly make it out, sir, with these. I'll go aloft and take a look round.'

In less than five minutes his voice came from the foretopmast crossrees: 'Below there!'

'Ay! ay!' responded the mate.

'That's a ship's boat ahead there, sir, from what I can make of it; but it ain't no bigger than a man's hand from here,' reports the bo'sun.

'So I thought,' was the mate's reply. 'All right; that'll do.' Then glancing at the canvas aloft, he muttered an oath. 'Confound the wind; it's dying away altogether now.'

And so it was; and by the time the sun had been above the horizon for an hour, there wasn't breeze enough to lift the leech of the royals, and the lower sails beat against the masts and riggin' at every roll of the vessel; for though the surface was like a lookin'-glass, there was a bit o' a swell on that might ha' bin a reminder of some of the heavy weather we'd bin havin', or it might mean a bit of a breeze again before nightfall. Anyway, there we lay with the tacks and sheets hangin' in festoons over the side, and a stretch of blue water lyin' between us and yonder speck, that had got to be covered somehow.

As you may guess, we were all agog at this news, and not a few of the watch below turned out to have a peep over the weather bulwarks. Some said they could see her, or made out that

they could; but for my part, when I came to look, I couldn't for the life o' me make out her whereabouts. But there was no doubt about it, she was there, and maybe half-a-dozen poor wretches aboard of her, wonderin' whether the big ship saw them, or was going to leave them to their fate.

In the meantime the mate had gone below and roused out the skipper, who came on deck lookin' sleepy and not over good-tempered. He had a look through the glasses, and, my word, you never saw such a change in a man all at once. He was wide awake in a moment, takes a turn or two up and down the deck, glances sharply aloft at the idle canvas, and then has a careful look all round the horizon, as if looking for the wind; but never so much as a breath came to his aid. A few words with the mate, and his voice rings out over the deck: 'Clear away the starboard lifeboat.' A dozen hands spring forward to execute the order; and in less time than it takes me to tell you, lads, the lashings were cut and the boat swung over the side.

'Lower away easy there,' comes the next order. —'Now, Mr East, take half-a-dozen men with you, and make the best of your way to yonder boat, and let us know whether there's any one living or dead aboard of her; but don't be longer than you can help, for I believe the breeze'll freshen again soon, and we don't want to lose a day.—Bo'sun, pipe the hands to shorten sail, and clew up your fore and main sail.'

You may be sure I did not want to be asked to form one of that boat's crew. There was a bit of a scramble; but I was the first to drop into her. The number was soon made up; and in a few moments we had cast off, and were pulling in the direction of the derelict.

From her royal masthead to her water-line, our ship looked a picture as we pulled away from her; and the voices of those left aboard, as they bent to the ropes, drifted cheerily over the sea. It was a stiffish pull, I can tell you, for the sun had got a bit o' power by that time, and made things warm all round, and the distance seemed twice as long, for every man was on the tiptoe of excitement, and anxious to get alongside, and kept lookin' over his shoulder to see what way we were makin'. The mate he says nothin' but a few words of encouragement every now and again; but at last he stands up, grasping the tiller ropes in his hand, and with his eyes fixed on the boat we were makin' for. Every line of his face was workin' with excitement; but a moment afterwards, he turned the colour o' the canvas, and said in a husky voice that weren't a bit like his own: 'We're too late, lads! Easy all! Stand by for'ard there with the boat-hook.' And the next moment we were alongside the stranger, to find—a few rags of canvas hanging from a mast, an empty water-breaker awash in the bottom, some pieces of sodden leather, a pencil-case, and a human figure huddled in the stern sheets—dead.

Well, mates, we took the boat in tow and made back for our own craft. The breeze had sprung up at last, and she was coming down to us like a yacht, hand over hand, with every line of her canvas filled, and it was a pretty sight to see her hove-to. There was a row of anxious faces lining the bulwarks as we pulled alongside; but they

disappeared one by one when they saw that we had done no good. That night we stood round the gangway bareheaded while the skipper said the last words over the poor fellow.

Then we made sail once more; and never from that day to this has it ever been discovered to what ship or to what port that boat belonged.

THE LADY SORROW.

THE Lady Sorrow came to me;
Her lips were wan, her pace was slow;
She carried rue and rosemary,
And sad her accents were, and low.

The wind rose in a gust of sighs,
The clouds broke in a storm of tears;
And she too wept, for in her eyes
Were met the woes of many years.

I rose to meet her; and I knew
In that dark hour she brought my doom:
'I know thee by thy gathered rue,
I ask not wherefore thou art come.'

She took my hand; her palm was chill;
She led me on through thorns and mire,
By swampy fen and windy hill,
O'er fields of snow and lakes of fire.

At last she brought me to a wood;
The boughs grew thick, no light came through;
She stayed and kissed me as I stood;
She passed before I saw or knew.

And, with that chrism upon my brow,
Forward I went: the dark grew light;
By firm wide paths I journeyed now,
With snowdrops sown and aconite.

And out into the busy world
I pressed with eager heart and feet;
From cottage roofs the thin smoke curled;
The cock crew loud, the flowers bloomed sweet.

And every worker that I met
Smiled back in answering sympathy—
'Her sign is on thy forehead set;
Who comes to all has been with thee.'

* * * TO CONTRIBUTORS.

1st. All communications should be addressed to the
'Editor, 339 High Street, Edinburgh.'

2d. For its return in case of ineligibility, postage-stamps
should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANU-
SCRIPTS, whether accompanied by a letter of advice or
otherwise, should have the *writer's Name and Address*
written upon them in FULL.

4th. Offerings of Verse should invariably be accompanied
by a stamped and directed envelope.

*If the above rules are complied with, the Editor will
do his best to ensure the safe return of ineligible papers.*

THE VALUE OF TRAINING-SHIPS.

THE maritime supremacy of Great Britain and Ireland has been so long an established fact that no Briton of the present day doubts it; indeed, we may say that he considers it as a birthright which no foreigner can take from him, strive as much as he may. These are 'prave worts,' and are justified, not only from the experience of the past, but from the position which the ever-increasing numbers of our mercantile navy at present enjoys. The rise of our merchant shipping has been, and is, the largest factor in the commercial and 'shop-keeping' primacy which we maintain against all comers; and it is widely recognised that this form of British industry is as successful against foreign competition as it always has been. Our shipowners have been foremost in taking practical advantage of every scientific improvement and utilising it, even when the origin has been a foreign one. The rise of their reputation has not been sudden; but it has been considerable enough to show to foreign nations that the maritime instinct is as strong now as it was in the days of the vikings, without, let us hope, their savage and warlike desires. Whilst our shipowners have been taking the lead in building ships and steamers and sending them to all parts of the world, they have been heedful of the claims and requirements of their sailors, and have acknowledged the paramount importance of technical instruction by establishing training-ships in various ports of the United Kingdom.

The increased recognition of the value of training-ships and the good they are doing is shown by the fact that there are at the present time twenty-one vessels devoted to the education of those who will, it is expected in the future, man our royal and mercantile fleets. Two of these, the 'Worcester,' stationed at London, and the 'Conway,' at Liverpool, are designed to train and educate boys intended for officers in the mercantile navy; and, by an order of the Board

of Trade, two years' service on either of these ships will reckon as one year at sea. The growth of our shipping and the home and foreign commerce of this country have necessitated the establishment of these two ships in order to give a thorough nautical education to boys who desire to become officers in our mercantile marine service.

The general scheme of education seems to be almost identical on board both ships, and the boys go through the usual course of a high-school curriculum, without the classics; but including navigation, nautical astronomy, chart-drawing, &c. They are also taught French; and, during nautical instruction, are exercised in the duties of a first-class ship, such as every sailor learns afloat, with the addition of the management of boats and practical navigation generally. It will doubtless be news to many of our readers that instruction is also given in the most useful and practical departments of surgery and medicine. How necessary this knowledge is on board ship, when thousands of miles away from a doctor, dispensary, or ambulance, will be appreciated even by careless Jack. The fees for admission on the 'Conway' are fifty-five guineas per annum, which include the uniform, outer clothing, medical attendance, washing, use of books, stationery, &c. Those for the 'Worcester' are fifty guineas and forty-five guineas respectively, according to age, with the addition of ten guineas a year for uniform, medical attendance, and other items similar to those of the 'Conway.' Her Majesty the Queen presents a prize annually to each ship: a gold medal to the boy who shows the qualities likely to make the finest sailor. These consist of cheerful submission to superiors, self-respect, and independence of character, kindness and protection to the weak, readiness to forgive offence, desire to conciliate the differences of others, and above all, fearless devotion to duty and unflinching truthfulness. Her Majesty has also been pleased, with a view to encourage the boys of the 'Conway' and 'Worcester' to qualify themselves for cadetships

in the navy granted by the Admiralty, to declare her intention of offering a prize annually to each ship to the boys who compete for cadetships in Her Majesty's service. This prize will consist of a binocular glass with a suitable inscription, and a sum of thirty-five pounds towards the expense of the outfit of the boy who obtains the prize. Twelve appointments as midshipmen in the Royal Naval Reserve are annually granted by the Lords of the Admiralty for the two vessels. In addition to the foregoing, appointments as leadsmen apprentices in the Bengal pilot service are placed at the disposal of the Committees of the two vessels by the Secretary of State for India. The Committees of both ships, if a boy have completed two years' course of study to their satisfaction, will do their best to obtain a situation for him on board a ship whose owners are known to them.

Another scheme for the education of embryo officers for the merchant service has been inaugurated by Lord Brassey, with the co-operation of Messrs Devitt and Moore, the eminent London shipowners, who have accordingly arranged to adapt two vessels on their Australian line for this purpose. The ships will each carry twenty-four midshipmen, a surgeon, and a naval instructor. This latter officer will teach navigation, nautical astronomy, &c., and superintend their instruction in seamanship and other duties of the profession while afloat or in a colonial port. The reason for the promotion of this scheme is stated to be that boys—say from the 'Conway' or 'Worcester'—under the ordinary conditions of training in the merchant service are apt to forget, in the absence of technical instruction at sea, the knowledge they have previously gained. The project of Lord Brassey will therefore enable boys during their period of service to retain the acquaintance they have gained of nautical matters, and add to it the necessary scientific education requisite before they can obtain a Board of Trade certificate to act as officers. The premiums payable for five voyages to and from Australia—each lasting between nine and ten months—for youths who have served two years in a training-ship are £170, while for boys who have not so served the premiums are £230. In addition, the outfit for each voyage is estimated to cost about £35. The premiums, beginning at £60 and £70 respectively, are graduated, are payable voyage by voyage, and either party is at liberty to withdraw at the close of any voyage.

Whether parents, desirous of sending their sons to sea, will avail themselves of the plan proposed, remains to be seen; although Messrs Devitt and Moore estimate that the amount received by them must be expended in the education and maintenance of the boys. Messrs Devitt and Moore inform us that 'when the first ship sailed on the 18th July the scheme had not been known long enough for her to fill, and she only had four-

teen boys on board. Considering, however, the number of applications we now have, we expect that next year both ships will be overflowing.'

The design of Lord Brassey is practicable, and ought to command success, more especially as it is impossible to exaggerate, in view of the outcry of shipowners for a supply of well-educated and efficiently-trained officers, of whom there appears a serious lack. If the experiment have the effect of inducing parents to send their adventurous boys to sea, under the favourable conditions represented, much will be gained; but much more will be gained if the outcome of the project be a more efficient and highly-trained class of officers.

The other nineteen training-ships possess accommodation for 5370 boys, who are being disciplined as fore-castle hands; and at the end of 1889 there were actually on board 4705 or about eighty-seven and a half per cent. During the last year the committees of the various vessels passed 1340 into the merchant service, and sent into the royal navy 175. A singular fact in connection with these training-ships is the large number of lads who join the army and navy as musicians, and are constantly being requisitioned by officers in the army when seeking youths to fill up the vacancies made in their regimental bands.

The oldest of these associations for the maintenance and instruction of boys as ordinary seamen is the Marine Society, which was instituted so far back as 1756. The history and progress of this Society is interesting as being the pioneer of the training-ship system so largely adopted now for the education of boys intended for the sea. The Society had its origin in the middle of last century, when Sir John Fielding, at the suggestion of a nobleman, collected a number of wretched and distressed boys and sent them on board his majesty's ship 'Barfleur,' then commanded by the Duke of Bolton, who clothed them at his own expense. The utility of this humane design, in rescuing from misery and reclaiming as many as possible of this class of neglected youths from the paths of idleness, and too probably of infamy and ruin, was so obvious, that the plan was immediately followed up by a gentleman who had accidentally met these lads while on their way to join the 'Barfleur.' By a subscription, which he promoted, from three to four hundred boys were in a short time clothed and provided for in a profession most likely to make them useful and creditable members of the community.

The success of these two experiments was so highly appreciated, that in 1756, at a meeting of merchants and shipowners held in the City of London, Mr Jonas Hanway, the well-known philanthropist, proposed that a Society should be formed to clothe boys for the sea. This was the beginning of the Marine Society, which was formally incorporated in 1772 by Act of Parliament, and has, since its inception, sent to sea 60,800 boys, of whom 27,300 have been drafted into the royal navy. It was not, however, until 1786 that a merchant ship named the 'Beatty' was purchased and fitted up as a training-ship. Since then, the Admiralty have accommodated the Society with the loan of government ships, and have replaced them when worn out. The ship at

present used by the Society is the 'Warspite,' lying off Woolwich. She is a two-decker, was formerly the 'Conqueror,' and has accommodation for three hundred lads. The Society is supported by voluntary contributions, and distributes an annual income of about eleven thousand pounds. An admirable adjunct to the ordinary education of the boys is that of swimming—which is also taught on the other training-ships—for the teaching of which the Society possesses a bath at Charlton, where about sixty per cent. of the boys learn to swim. The Committee state that their boys are in greater demand than ever, not only in London, but from other ports; and they express regret that the funds of the Society have been of late years much reduced, with a consequent diminution of the scope of operations. The rules with regard to admission appear to be simple, and are almost alike on similar training-ships, with the exception of those which are appropriated to reformatory boys, or boys under the Industrial Schools Act of 1866 and the Elementary Education Acts of 1876 and 1879. The following are the rules for admittance. Boys known to have committed any act of dishonesty are not admitted. If sufficient town boys do not offer, boys from the country may be admitted; parish boys may be admitted on payment of four guineas each. Boys whose friends appear to be in a capacity to fit them out for sea at their own charge shall not be received. Boys are admitted from thirteen to sixteen years of age; and the minimum height under fourteen years of age is four feet nine inches; above fourteen, four feet ten inches. The average period of training ranges from two to four years. The dietary scale for these ships is both ample and varied, and the daily routine of work and recreation is sufficiently diversified to avoid monotony. Religious instruction is given four times a week, with a morning service on Sunday. There is also the administration of the holy communion once a month and a confirmation once a year. All the other training-ships at the various ports in the United Kingdom appear to have taken the Marine Society's system of instruction and management as their model, altering it, of course, to their varying needs.

The general objects of these training-ships for ordinary seamen are to take hold of homeless, destitute, neglected, and orphan boys, and those in danger of being contaminated with vice and crime, and educate them to become forecandle hands. Five of these ships are supported wholly by voluntary subscriptions, whilst the other fourteen are maintained by government grants, county allowances and subscriptions. Three of the vessels are devoted to Reformatory boys, one of them being appropriated to Roman Catholic lads.

These institutions—we do not speak so much of those ships which educate intending officers—have a high claim upon the sympathies of the public, who have not been slow to respond, as is shown from the fact that but one of these establishments is in debt, and that only to the extent of about twenty-eight pounds. There is no doubt that 'a life on the ocean wave' for spirited and adventurous lads is the most natural and best outlet; for most boys have a predilection for the sea, and on training-ships part of their aspirations is fulfilled. But there are difficulties in the way;

for good sailing-vessels always carry apprentices, from whom are drawn our officers; and steamers seldom carry boys, and even when they do, there are few opportunities for rising in their profession and qualifying for officers. As an instance of the good effected by training-ships, we are informed from the Government Blue Book that ninety-two per cent. of the boys drafted from the training-ship 'Empress,' stationed in the Clyde, are 'doing well.' The percentage of 'getting on' or 'doing well' all round shows that the education given, and the moral training given, have resulted most favourably, while the objects contemplated have been more than carried out.

The cost of feeding, educating, and clothing these lads during their probation on board averages about twenty pounds per annum all told. This cannot be considered an extravagant sum when we learn how much permanent good is done to the boys themselves, while the beneficial effects resulting to the nation are immeasurable. Training-ships are in fact 'nurseries for seamen;' for only a small proportion of the boys afterwards engage in shore pursuits, the majority going to sea in various capacities.

We boast several practical institutions in the way of schools; but there are none which produce such excellent and encouraging results as the twenty-one training-ships round our coasts, where seafaring education and discipline cannot fail to be of advantage in whatever vocation the boys educated on board may follow. After a careful perusal of the Reports, we have come to the general conclusion that more training-ships are required; and we have every confidence that they will be supplied by our mercantile and shipping community, whose policy should be to encourage and support vessels on which our future seamen can be so instructed as to maintain our place as the first maritime power in the world.

DUMARESQ'S DAUGHTER.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,'
'THIS MORTAL COIL,' ETC.

CHAPTER XXXIV.—A VISION OF THE NIGHT.

ALL is not lost even when things look blackest on the surface. About those same days—while Psyche was mourning her lost love in Algeria—away to the south of the African desert, a belated caravan was struggling along on its way northward, bringing with it two weary and footsore Englishmen, refugees from Gordon's conquered force at Khartoum. Both of them were clad from head to foot with scrupulous nicety in Arab costume, and both were to the outer eye of Islam devout Mohammedans of the purest orthodoxy.

After the final assault of the 26th of January, when those two stray Englishmen had been wounded and left for dead among the slaughtered in the great square, their bodies were taken up by the Mahdi's people, and carried some time later into the rough hospital which Gordon had built, with the rest of the sufferers. There, they revived against all hope. One of them, a tall dark man with a somewhat sad Oriental face,

spoke Arabic with the perfect fluency of a native : by his aid, the other, of more European-looking and whiter type, had been recognised by the Mahdi's troops as a good Moslem in the Egyptian service, and spared accordingly from the doom of slavery which was the universal fate of the remaining handful of Europeans left alive in conquered Khartoum. After a month or two of convalescence in the captured city, the two refugees had started with a caravan going westward toward Darfur and the Central Soudan. Considine was right : his companions had escaped with their lives indeed from that carnagole of slaughter. But to get away to Europe was a very different and much more difficult matter. Linnell knew, indeed, how impossible it would have been to force his road northward by the direct route to Dongola and Cairo, or even to seek the Red Sea coast at uncertain Suakin. To do either would be to proclaim themselves at once as Christians, or at least well-wishers to the Egyptian cause. Their sole chance of escape lay, therefore, in accepting both Islami and the Mahdi with perfect resignation, and trying to retreat upon the further interior, where the Khalifa reigned supreme, rather than in attempting to open communications northward with Egypt and the infidel.

The painter's plan, accordingly, was to cross the desert by Ideles and Ouargla, and to come out with the caravans that abut at last on the Mediterranean in Algerian territory.

It was a bold design. The notion was indeed both a difficult and a dangerous one. In order to accomplish it, they had to pass through the midst of a fanatical population, lately excited to the highest pitch of religious frenzy by the Mahdi's revolt, and ready to kill at a moment's notice, without trial or appeal, any man even suspected of being not merely a Christian, but even an orthodox anti-Mahdist Mussulman. The slightest departure from the intricate rules of Moslem ceremonial, the faintest indication of ignorance or unfamiliarity as to the endless details of Moslem ritual, the tiniest slip in speech or manners, would have entailed upon them both instant destruction. Linnell, however, was an old hand at the devices and shifts of Oriental travel : he taught his companion all he knew himself : and by sedulously giving out that they were Asiatic Mussulmans, retiring from Khartoum after having lost their all during the protracted siege, he succeeded in drawing off suspicion from his too dangerous neighbour, who had thus no need to communicate directly with the Arabs at all. To the other members of the various caravans they joined on their way—for they shifted often of set purpose—they were merely Mohammed Ali of Sind, and Seyyid Ben Marabet of Upper India. Mohammed Ali could speak Arabic well ; the Seyyid, as was natural, though skilled in the Koran, knew no language at all save his own local Urdu tongue.

On such terms, the fugitives had managed to make their way by long slow stages as far as Tintellust, whence they were endeavouring now to cross the main desert by the accustomed track to Ideles and Ouargla.

Ghastly as all their experiences of Eastern travel had been, this particular march was the ghastliest and most dangerous of any. Suspicion closed in upon them, they knew not why. The nearer they came to Christian rule, the more did their companions appear to distrust them. On one particular night, during that terrible march, the camels had all been arranged for the evening, the Arabs were all resting in their places in the tents, and the two Europeans in a remote corner sat chatting together wearily and in doubt about their further progress.

'Austen,' Linnell began, in a very commonplace and natural tone, dissembling his feelings, 'don't look at me as if I were saying anything the least out of the way, and don't speak as if you were at all alarmed or suspicious. But there's danger ahead. Things are coming to a crisis. I've been expecting it daily for some time past, and now I'm sure it's actually upon us. You made one or two mistakes in the mid-day prayers, I observed, to-day : omitted to turn to Mecca after the last clause of the Litany of the Faithful—and the Sheikh, I'm sure, suspects you of being a Christian.'

'You don't really think so?' Sir Austen answered, making his tone seem as simple and unconcerned as possible, in spite of the alarm this announcement inspired, for fear the Arabs should notice they were talking secrets together.

'Yes, I do,' Linnell replied, as jauntily as before. 'The position's critical : extremely critical. We must be very cautious how we proceed in future. A word, a look, a movement may lose us all. There's another caravan gone on, you know, towards Ideles yesterday. If only we could slink away safely to that one, where we're not known, we might avoid any further suspicion for the present. But here, we shall be watched with a thousand eyes, and the tiniest new error will seal our death-warrant.'

Sir Austen pretended to look idly around. 'What do you propose to do, then?' he asked with a careless expression. 'Do you think it would be possible for us to give them the slip and steal clear away to the party in front of us?'

'If it's done at all,' Linnell answered promptly, pretending to be deeply engaged in discussing the arrangement of his native boots, which he turned over and inspected with minute care, 'it must be done this very night, not a moment later : delay would be fatal.—Just look at this hole here. Could I sew it up, do you think? Ah, yes, I thought so.—The fastest camels have done comparatively little for their powers to-day. If we took them out by three in the morning, they'd be fresh enough for our purpose, and we might get such a start that the caravan people could never overtake us with their lumbering beasts. And we could easily make the others believe we'd been forced to flee from robber Bedouins.'

'Shall we risk it?' Sir Austen asked, turning over the boot and pretending to be engaged in discussing the ways and means of mending it.

'We will,' Linnell answered. 'It's agreed, then. Good. At three o'clock. We've had many close shaves of our lives together, Austen, and I'm almost beginning to get tired of them now ; but for one person's sake, I'll have a try once more. I want, if I can, to get back with a whole skin to England.'

Sir Austen gathered up his burnous and examined the hem. 'Charlie,' he said penitently, 'this is all my fault. Why trouble yourself with me? There'd be no danger for you if I were left behind. Go on yourself alone, and leave me, if you will, to their tender mercies.'

'No, no,' Linnell answered, hardly repressing his natural horror at such a proposition. 'We've risked it together so many months now, and we'll risk it to the end, come what may of it.'

He spoke as carelessly and as lightly as he could; but his voice even so had a tinge of solemnity that roused the Sheikh's unfavourable attention. 'Mohammed Ali,' he cried, gazing over at him curiously from under his eyebrows, 'what are you talking about with your countryman so much? The servants of the Prophet should rest in peace. It is not well that a noise should be made in the tents at nightfall.'

'I will rest, Sheikh, in Allah's name,' Linnell made answer piously, with an appropriate gesture.—'Not another word, Austen,' he added warningly. 'He's very suspicious.'

'Mohammed Ali,' the Sheikh said again, glaring most ominously at both the men; 'come away from your countryman and sit by my side. Let Seyyid Ben Marabet take his place at the far end in the corner by the baggage.'

Linnell knew better than to demur to this order. He rose at once, with a most submissive air, as becomes a Moslem, and took up his place where the Sheikh beckoned him. Sir Austen also stood up instinctively, and moved to the spot that Linnell's hand pointed out in silence. In such a case, implicit obedience was their only chance of avoiding immediate murder.

Reduced for the moment to absolute quiet, Linnell curled himself up in his thick burnous and tried his best to snatch a little sleep, but found he could not. The terrors and dangers of their situation weighed too heavily on his mind to admit of rest. He waited anxiously for three o'clock to come. He dared not even turn where he lay, for fear of arousing fresh distrust. He held himself in a cramped position for hours at a stretch, rather than wake the Sheikh or the Arabs from their snoring slumber.

Sir Austen was more fortunate. Wrapped up in his rugs he dozed off for a while in the corner where he lay, and refreshed himself against the toil they must necessarily endure before morning. But even he could hardly sleep for excitement and suspicion. His rest was very broken indeed. He turned and tossed with occasional low groans. About half-past two his head moved violently. Some strange and horrible vision was sweeping before his eyes, Linnell felt certain.

And so in truth it was. A strange and very unnatural nightmare. Sir Austen, as he lay on the bare ground, curled up in his burnous, and grasping his pistol, was dreaming a dream so terrible in its way that it might well have made Linnell's blood run cold within him had he only known it.

A ghastly dream—cruel, wicked, horrible! On the sand of the desert, in the early dawn, Sir Austen seemed to his disordered fancy—what will not sleep suggest?—to be leaning over a body—a lifeless body—he knew not whose, or how it came there. A great silence brooded over the

scene: a red-hot sun: a brown hot desert; and full in its midst that mysterious body! It was a bleeding body; bleeding from the head. He looked at it close. Wounded: ah, wounded: a great round wound on the right temple. Shot: but by whom? Sir Austen, turning and groaning, knew not.

His dream paused. He slept. Then he dreamt again. The same dream as ever. An awful mystery seemed to surround that body. Sir Austen, gasping in his sleep for breath, was dimly conscious of some terrible remorse, some awful link that seemed to bind his own soul to that murdered corpse. Ah, heaven, what link? Whose it was, or why he had shot it, he had no idea. Face and form suggested nothing to him. All was vague and blank and terrible. But an appalling consciousness of guilt and crime seemed to swamp his senses. He knew only in some dim, half-uncertain way that the man was dead—and that he himself felt like a murderer.

He turned restlessly once more upon his outstretched rug. With the turn came a change. The light of the oil-lamp was flickering on his eyes. It brought a new chapter in his uncertain vision. His dream melted away to an English lawn. His wife was there—that dear young wife of his—and she read him a letter: an important letter. It was a lawyer's letter about some inherited wealth. He hardly understood at first what it was all about; but in some dim fashion he fancied to himself he had come unexpectedly into a great property. Something about a lawsuit with somebody who claimed to inherit the estate. 'Pooh, pooh,' he heard his lawyer say idly in his dream; 'the girl hasn't got a leg to stand upon.'

He dozed for a while, in a quieter fashion. Then he found himself once more crawling on all-fours on the desert sand. The corpse was there, whiter and more horrible to behold than ever. It lay on its face, weltering in blood. A hideous curiosity possessed his soul. He *must* find out whose body it was. He turned it over, and gazed on its features.—Oh horror, he could hardly believe his eyes! It was Charles Linnell who lay dead and stiff before him!

Then a hideous truth flashed over him like lightning. Murdered! And by him! For his money, his money!

With a start and a cry, Sir Austen awoke. He sat up in his horror and gazed wildly around. Thank Heaven, thank Heaven, it was all a dream! He wasn't a criminal! He wasn't a murderer! There stood Charles Linnell, gazing at him reproachfully, not dead, but alive, one finger on his lip, and one on the watch he held out before him. Sir Austen, remembering where he was and how, took it all in at a rapid glance. It was the stroke of three—and his terror-stricken cry had almost roused the slumbering Arabs. In a second he was awake and all himself again.

Noiselessly and silently they crept from the tent, and stole unperceived into the open desert. Sir Austen's heart beat hard even yet with the horror and awe of that strange awakening; but he stilled it with an effort and stole on by his cousin. They cleared the tents, and reached the camels' tether. Thank Heaven, thank Heaven, it was all a vision.

Yet what awful suggestion of Satan was this

that had come to him all unconscious in his dreaming moments? If Charles Linnell were even now to die— He shuddered to think he could even dream it.

SAVINGS-BANKS AND RECENT FRAUDS.

A SELECT Committee of the House of Commons sat lately, to inquire into and report on the administration of Trustee Savings-banks; the powers, duties, and liabilities of the trustees, managers, and officers of Trustee Savings-banks; the relations of these banks to the National Debt Commissioners; and the alleged assumption, by certain Trustee Savings-banks, of designations calculated to mislead depositors. This Committee, like its predecessor of 1858, was appointed because of the existence of serious frauds, whereby the earnings of the poor were put in jeopardy. Its object was to discover what were the weak points in the system under which such frauds could creep in, and also the amount of security possessed by depositors who left their money under the care of Trustee Savings-banks. There are 380 such banks, with forty-four millions of deposits, and 1,500,000 depositors.

It appears that the number of these banks is diminishing yearly, the Post-office Savings-bank, established in 1861, having proved a formidable rival, its depositors numbering about four millions, with deposits amounting to £66,000,000. Since the most serious case of fraud was discovered in 1886, a large number of Trustee banks have been closed. In 1888, eighteen banks were closed; since then, seventeen more banks have been closed; while fourteen were at the date of the inquiry in process of being closed. Those closed since 1888 represented deposits to about £560,000.

One witness described the Post-office Bank as 'a colder agency,' and said there was a kindly influence constantly going on between his bank (a Trustee bank) and the depositors. 'Poor people's affairs constantly get involved one way or another, and they come to the bank from time to time to ask advice; and it has been a great pleasure to myself and others in our bank to give that advice, and to keep them out of the hands of pettifogging lawyers, who fleece them greatly.' Another witness, an actuary, said many of the people he had to advise were very helpless. They used to bring their family troubles to him, and ask about their wills and family squabbles and things of that kind, which Post-office officials could not be expected to trouble themselves with. One woman who had invested up to her limit called one day, and he suggested to her to buy stock. She appeared to consider it for a moment, and, after a short time, she turned round and said she had no place to keep stock in. She thought he meant bullocks, or something of that kind.

Another objection to the Post-office bank was the want of secrecy attending its transactions. After every operation, an official letter at first,

with O.H.M.S., used to be received by the depositor, although now ordinary envelopes are employed to shroud the operation, if possible. It appears that every transaction with a Post-office bank costs the Government from fivepence to sixpence, for it has to be entered in the books of the central authority in London through the agency of the local office, who forward the depositor's book to London for that purpose. Another point brought out was the delay in paying a depositor what he wishes to withdraw. With the Trustee bank, although twenty-one days' notice can be claimed, the amount is always paid on demand; whereas, with the Post-office bank, communication must first be made with London before payment of a deposit can be made.

But a most important consideration comes into play, and this is the security on which each of these banks is based. If the Trustee Savings-bank is to be continued, as the Committee recommend, it is of vital interest to the community that the security it offers to the public should be well defined. In the case of the Post-office bank, the depositor has absolute security, for the State makes itself liable to the last penny for sums deposited with it, no matter how numerous the frauds of its officials may be. The Post-office bank is thus really the National Security Savings-bank, and was established by Mr Gladstone, because, he said, the mode of improving the constitution of Trustee Savings-banks so as to render them more advantageous to the public at large was a problem which the Government found extremely difficult to solve. The introduction of the Post-office Savings-bank was thus prompted by the desire of the Government to give ample security to depositors.

In the case of the Trustee banks, the Committee report thus plainly as to the position of these banks in respect of security: 'It appears that certain of the Trustee banks have been in the habit of using the words "Government Security," "National Security," "Government Savings-banks," or similar designations, in their books, notices, circulars, balance sheets, or other publications in connection with these banks. It cannot be too widely known that the use of such words is totally unauthorised and misleading, and that the Government is responsible only for such moneys as are transmitted to the National Debt Commissioners from time to time; and they would therefore recommend that every depositor's pass-book shall have clearly printed upon the cover a notification that Government is in no way responsible or liable to depositors for moneys placed in the safe keeping of such banks.'

It was incidentally brought out that the expense of the National Debt administration of the Trustee Savings-banks was about £5500 a year; while the amount of loss through these banks which the State had to make good for the past year was £25,000. It appears that certain weekly returns are furnished to the Commissioners of the National Debt Office, and that the latter exercise a kind of control over the accounts rendered, with a view to maintaining accuracy in the book-keeping. They have never been successful, however, in detecting the frauds that had been committed, the chief clerk plaintively stating: 'I may say that it is very disappointing

to us, after all our trouble, that we have not been the means of discovering any case of the kind. I do not think it has been useless, however, because we have put the trustees on the track of keeping their accounts correctly.'

Another point of importance brought out in the inquiry was as to the investment of money by the Savings-banks otherwise than through the National Debt Commissioners. Power to this effect was given the banks by a section of the 1863 Act, the consequence being that eighteen banks now avail themselves of the section to no less an amount than £4,061,000. This large sum is variously invested in corporation bonds, loans to School Boards and other local authorities, mortgages on freehold house property, heritable bonds, and at interest with Scotch banks. A declaration is usually taken from all the depositors who allow their money thus to be disposed of, and it is really in the form of a contract note, in which they contract themselves out of any liability on the part of the trustees. One of the deposit notes runs as follows:

'Deposit Note, Supplementary Investment Department.—I herewith deposit with the Trustees of the ——— Savings-bank the sum of ——— pounds, and request them to invest a like amount for me conjointly with any other moneys received by them, in the Supplementary Investment Department upon such securities as they in their judgment may deem expedient; and I hereby undertake to hold the said Trustees harmless and indemnified against any loss that may at any time arise under and by reason of any such investment, providing the same be in accordance with the bank's 12th rule. The bank will allow the depositors interest at the rate of $3\frac{1}{4}$ per cent. per annum, retaining the difference of interest received for expenses and contingencies, and deposits will be repayable on three months' notice, unless otherwise ordered by the depositor.' This is signed by the depositor.

The comment of the Committee on these fixed loans was that these investments do not come under the review of the National Debt Commissioners; and the Committee think that a very heavy responsibility is incurred by trustees by investments of this character.

As to the facilities afforded by the Trustee banks—out of 281 whose hours were given, 129 were only open on one day of the week, on an average of two hours weekly; 71 were open on two days in the week, on an average of four hours per week; 24 were open daily, on an average of twenty-five hours weekly; 37 were open on three or more days, on an average of ten hours per week; and 20 were only open once a fortnight or once a month, on an average of one hour per week. So that more than one-half the total number were open from one to two hours per week only. The Trustee bank appears to be the banker *par excellence* of the Friendly and Charitable Societies and penny banks, for the number of these Societies is increasing rather than diminishing. In 1887 the number of Charitable Societies was 15,861, with funds amounting to £759,000; of Friendly Societies, 14,342, with funds £2,500,000; and of penny banks, 2000, with £109,000. The interest allowed by the Trustee banks to the depositors has till lately varied from £2, 10s. to £2, 15s., and is now being

reduced in proportion to the reduction of the interest allowed by the Government.

The matter of runs on savings-banks came up before the Committee; and Mr Meikle, the Glasgow Actuary, stated that at the time of the Western Bank of Scotland failure in 1857, and of the City of Glasgow Bank failure in 1878, there was a run on his bank. He said: 'There was nothing for it but just to stand to your work and pay the people; they usually recover their senses in a day and a half.'

Mr Bartley, M.P., gave a graphic account of a run on his National Penny Bank at all its thirteen offices. He said it occurred in 1887, and began on a Wednesday evening. He had an idea of what was awaiting him, and had laid in a margin of cash against need. He kept his bank open till eleven that night and paid away all his money. Then he asked the crowd to return next day, which they did. At nine o'clock he was besieged; there were present hundreds of people; and about twenty policemen to keep order; and he had a reserve of £40,000 in cash and notes. He had eight or ten clerks, and they paid 1622 persons in twelve hours the sum of £23,000. To his mind, the best way of settling a panic was to pay quickly and so disperse the crowd. The great difficulty in the way was the mechanical one of making payments to so many persons.

We come now to the grave question of frauds by savings-bank officials, which, as we remarked, formed the cause of the Committee's appointment. The Committee report that since the year 1863 there have been a certain number of cases in which serious defalcations have been discovered in the case of Trustee Savings-banks. Between the years 1878 and 1887, serious defalcations were discovered in connection with eight different banks. By Act of Parliament called the Trustees' Savings-bank Act of 1887, a local inquiry can be held into the affairs of a bank on application to a judge of the High Court of Justice under certain well-defined conditions. Under this Act, the Honourable Mr Stanley was employed to report to Parliament as to the state of one of the defaulting banks. The frauds, he found, extended over a period of at least twenty years, and amounted in the whole to £37,000. The money had been stolen in two ways: the actuary used to receive money on behalf of the bank outside office hours without the control of any trustee or manager, and he used to embezzle that money. He made no entry of it in the cash-book. He used also to make false entries in the cash-book of money which he represented himself as having repaid to depositors, who, he said, had come and drawn out money outside the office hours in the absence of the trustees and managers. These frauds were facilitated by the fact that the trustees and the managers were in the habit of allowing him both to receive and to pay money outside the office hours with no check upon him, and even sometimes outside of the bank premises. When money is paid or received by a savings-bank, it is a rule that the transaction should pass through the hands of two parties. This direction, along with almost all the others, was not complied with.

The class of persons dealing with the bank was of the most facile description. 'If I could only tell you how ignorant and helpless these

poor people are, you would see how very difficult it is to protect them. Many of these people could not read or write. Many of them could only speak Welsh, and they took the word of the manager or actuary as quite conclusive.' So said the Honourable Mr Stanley.

The National Debt Office regarded the savings-bank in question as a model bank, and the audit of the actuary's books was made in the most perfunctory way by one of the two auditors appointed for the purpose. The first auditor used to take the actuary's word for the accuracy of any statement, without taking steps to verify it. The second auditor, who acted for about a year, stated that he spoke to individual trustees and managers, and complained of the loose management of the bank; but he got snubbed for his pains. The actuary was in the habit of violating that portion of the Savings-bank Act which prescribes £200 as the limit of individual deposits with interest, and rather encouraged it. When a depositor called attention to the printed rule and said, 'May I?' he was told: 'Yes; you may put in as much as you like: put in until we tell you to stop.' The result was that an amount of £51,000 was accumulated on accounts in excess of the authorised limit of £200 for each account, this state of things being concealed from the National Debt Office.

With regard to the discharge by the managers of their duties, the latter stated that they took so little interest in the affairs of the bank that they would sign any paper the actuary put before them and never dream of reading it. The working trustees who attended at the bank on Saturday and Monday would come to the Board and sign as if they had received the money, doing just what the actuary told them. One unfortunate trustee who lived near the bank was guilty of more irregularities than all the rest; he used to be called in upon the Friday evening, and would then sign for all the money that the accountant told him he had received during the week; he would write that in on Friday evening as though he had received it on the Saturday morning.

The actuary who committed all the frauds never took a holiday himself. If he had been obliged to take a holiday every year, and had gone away for a month, his frauds would have been detected at once.

Regarding other cases of fraud, three of them represented frauds by actuaries. Another which took place was reported on by the Commissioner appointed under the Act. From this Report it appears that for seven years (if not longer) a junior clerk had been able to appropriate annually considerable sums from the funds of the bank, amounting in the aggregate to about four thousand pounds. He effected this in a variety of fraudulent ways, chiefly by tampering with the pass-books, receiving money from depositors without corresponding entries in the ledgers, paying money to himself indirectly on fictitious pass-books, and by falsifying the liabilities of the bank at the end of each year, in order to cover the amount he appropriated. He could not have done this without the greatest negligence and incompetence of nearly every person connected with the bank. The examination of the pass-books with the ledgers was entirely dispensed

with. Had this been observed, the Commissioner reports that it would have been very difficult for the delinquent to manipulate the pass-books.

THE HEIR OF ROTHWELL CHASE.

A STORY.

By T. W. SPEIGHT.

IN FIVE CHAPTERS.—CHAP. I.

'Good gracious, Therese! whatever is the matter? You look for all the world as if you were going to have a bad illness,' said Mrs Marchmont as she pushed back on its casters the low chair on which she was sitting, and thereby widened the distance between herself and the person she had thus addressed. 'I hope to goodness you have caught nothing infectious. I am told there is a great deal of fever in the neighbourhood just now.'

'It is nothing but a sick headache, madame—nothing but that, I assure you,' was the reply in the quiet, unmodulated tones in which Mrs Marchmont's maid habitually addressed her mistress. 'If madame can spare me, I will mix myself a tisane, and lie down for a few hours. I have had these headaches before, and know how to treat them. Madame may rely upon it that I shall be quite well again by morning.'

Therese Cobran, although Swiss by birth, had resided in England for so many years that only by a slight peculiarity in the pronunciation of certain words could her foreign origin be detected.

'Go, by all means. Of course, it will be very inconvenient for me if you are not better by morning; but, in that case, Dr Marsden had better see you as soon as possible.'

'Madame is very kind—as she always is; but I shall be quite well by to-morrow.'

'You had better go at once. As you pass the nursery, you can tell Fanny Dale to bring me my cup of tea this afternoon, and that she will have to attend me later on while I dress.'

Therese curtsied and left the room. As she shut the door softly behind her, the expression of her face changed with startling suddenness. It was as though a mask had been plucked away. She was no longer the same woman who was in the habit of going about her duties with a general air of self-effacement, and whose manner towards her somewhat imperious and quick-tempered mistress was one of servile, not to say fawning, obsequiousness. The thin hard lines of her mouth curved into a smile of malicious—it might almost be called malignant—triumph; her light-coloured eyes, neither blue nor gray, but an indefinite mixture of the two—which usually looked out at the world from the ambush of their white lashes with such a cold and almost fish-like regard—seemed as if they had been lighted up from behind, and gleamed like two vivid sparks of baleful fire.

'Step number one, *chère madame*,' she said, turning as if to address her mistress, although there was the closed door between them, while nodding her head slowly and meaningly. 'Step number two to-night. Ah, but you shall suffer!—you shall suffer!—you shall suffer!'

Pressing her clenched hand to her bosom, she

stood motionless for a few moments, as if to give time for the fire which had so suddenly blazed up to die down again. Then, with swift and noiseless steps, she went the length of the corridor and opened a door at the farther end. As she did so, a pretty picture met her view. The room, which was a large one, was fitted up as a nursery, with a rocking-horse and a swing, and toys of various kinds scattered about the floor. Its only occupants were a girl of seventeen and a sturdy, handsome, brown-eyed lad somewhere about three years old. The child was Frank Overton Marchmont, grandson and heir to Sir Harry Marchmont of Rothwell Chase; the girl was his nursemaid, Fanny Dale.

At the moment Therese opened the door, Fanny, with a long rein affixed to one of her arms, the other end of which was held by the boy, was slowly careering round an imaginary sawdusted circle, while Master Frank enacted the part of ring-master, doing his best to make his whip crack and shouting 'Houp-la!' in a shrill treble.

'Law, mamzelle, how ill you look, for sure!' exclaimed Fanny, as she came to a sudden halt.

'It is nothing but a sick headache,' replied Therese coldly. 'Madame has given me leave, and I am going to lie down for a few hours. She asked me to tell you to take her a cup of tea at half-past-five; so please not to forget. You will also have to attend her when it is time to dress for dinner. By to-morrow I shall be quite well.'

'All right, mamzelle; I'll not forget,' replied Fanny, who was the essence of good-nature. 'And I'm sure I hope you will be better by morning.'

Therese stared at the child for a moment or two in silence, then nodded to Fanny and withdrew, closing the door softly behind her. 'Me no like Ma'zelle Teyase,' remarked Frank with the outspokenness of his age.

'Why don't you like her, darling?' demanded the nurse-girl.

'Me not like her eyes—they frighten me.'

Therese ascended to her room, which was on the next floor, and having secured herself against intrusion by locking the door, she proceeded to apply a lighted match to the contents of the grate, which had been laid ready for kindling. It was a chilly afternoon in early spring, and Therese always took sensible views where her own comfort was in question. A person in her position was not supposed to need a fire in her bedroom; but a shilling given now and again to the chambermaid smoothed over all difficulties in that respect. The next thing she did was to take off her black dress and her cashmere shoes and put on a comfortable wadded wrapper and a pair of warm slippers. After that she proceeded to let down her hair, of which she had a great quantity, and the colour of which was as indeterminate as her eyes. Then she unlocked a drawer and took from it a square green bottle and a liqueur glass. Twice she filled the glass from the contents of the bottle, and twice she emptied it, sipping the cordial slowly and appreciatively. Her next move was, by means of a sponge and a little soap and water, to wash away the streaks of bistre under her eyes, now

that they had served their purpose. After that, knowing a couple of hours of inaction were before her, there was nothing left her to do save to bask in front of the fire in a chintz-covered easy-chair, with her feet on the fender, and immerse herself in a French romance, which she took from the drawer that held the bottle and glass.

Sir Harry Marchmont of Rothwell Chase was nearer seventy than sixty years of age. He was a widower and childless. His only son, a man of thirty, had died in Italy about a year before the opening of our narrative. There had been a coolness between father and son, owing to the fact of the latter having married in direct opposition to Sir Harry's wishes, and the two had not met for some years till that last meeting of all over Frank's deathbed. The woman whose marriage with his heir the baronet had so bitterly resented was the daughter of an Italian music-master and an English governess; and Sir Harry, who had been quite aware when he left England that his son's condition was hopeless, had been much exercised in his mind during the journey as to the best mode of getting his grandson, who was at that time nearly two years old, into his possession, and at the same time having as little as possible to do with 'that low adventuress,' the child's mother. But he had not been a dozen hours under the same roof with his daughter-in-law before the affair presented itself to him under a totally different aspect. There was no longer any question of separating mother and child. Mrs Marchmont's future home must be at Rothwell Chase. She was a woman whom any man might feel proud to have at the head of his table. That her father had been nothing higher in the social scale than a foreign music-master was a fact known to but few people, and the chances were that it would never reach the ears of English society.

Giulia Marchmont was not merely a very handsome woman, but a very capable one—so capable, indeed, that the late heir of Rothwell Chase, with his stolid intellect and limited range of emotions, had been as wax in her fingers, to be moulded into whatsoever shape might suit her purposes best. She had been fairly well educated, albeit after the somewhat slipshod fashion necessitated by her father's wandering life, Signor Viscari having been one of those restless mortals who can never settle for long at a time in any one place; but what Giulia might lack in the way of book-learning she more than made up for in worldly knowledge. She had lived for a longer or shorter time in nearly every European capital, and having a gift that way, she had not failed to avail herself of her linguistic opportunities to the utmost. In person she was tall and stately, with what is sometimes termed a 'Juno style of figure.' She had inherited her mother's delicate complexion and her father's brilliant Italian eyes, and finely arched but somewhat too prominent black eyebrows. Something else she had inherited from Signor Viscari—to wit, a liability to sudden volcanic explosions of temper, to bring about one of which, the merest trifle that happened to go awry would, when the mood was on her, serve as the requisite spark. Like

tropical storms, they were short and sharp; and scarcely were they over, before fair weather would set in again, to last with all but unbroken serenity till the gradually accumulated forces, no longer to be restrained, would break out once more, and that sometimes after a fashion which Mrs Marchmont herself was afterwards ashamed to recall.

So, poor Frank Marchmont having been laid to rest in alien soil, the baronet, the widow, and the youthful heir journeyed to England by easy stages, and after halting for a couple of days in London to pick up Sir Harry's ward, Miss Edeline Fenton, who had been staying with the Dowager Lady Cosgrave during her guardian's absence abroad, they all travelled down to Rothwell Chase together. Since that time, nearly a year had gone by, and Mrs Marchmont was now looking forward to the day when, with a clear conscience, she could discard her widow's weeds, of which she had long ago grown heartily tired, and be able again to shine forth resplendent in the silks and velvets which became her to perfection.

Edeline Fenton, Sir Harry's ward, was the orphan daughter of a man who had been far dearer to the baronet than any of his own kith and kin had ever been. At this time she was between nineteen and twenty years old, and on coming of age would inherit a fortune of fifteen thousand pounds. Her home since leaving school had been at the Chase; and had she been Sir Harry's own child he could scarcely have thought more of her than he did. She had, however, during the time of her stay with Lady Cosgrave been guilty of a terrible blunder, which, notwithstanding all his affection for her, the baronet found it well nigh impossible to condone. She had allowed herself to fall in love with Evan Marchmont, her guardian's nephew, and the last person on earth whose wife he would care to see her become.

It was not that Evan, either by word or act, had been guilty of anything which would suffice to account for his uncle's hostility towards him; indeed, the two had never met but twice. Evan's sole fault lay in the fact of his being the son of his parents. The young fellow's mother had chosen to jilt Sir Harry in favour of his younger and more attractive brother, and he had never forgiven either her or Godfrey. Although he had afterwards married, he had never cared for his wife as he had cared for Effra Vane; and even now, after the lapse of thirty years, the wound still rankled, the sore was still unhealed. When his brother died in a state that bordered on destitution, if he did not absolutely rejoice, he certainly could not be said to feel any sorrow even in its most mitigated form; and when, a little later, certain timid overtures reached him from the widow, they were coldly rejected. Neither to her nor to her son should the hand of reconciliation ever be put forth by him! The widow had followed her husband to the grave no long time afterwards; and now, at four-and-twenty years of age, their son was filling a responsible position in the offices of one of the largest ship-broking firms in the port of London.

It had been a bitter surprise to the baronet when his nephew called upon him at his hotel in

town and asked permission of him, as the young lady's guardian, to pay his addresses to Miss Fenton. The two were all but strangers to each other; and the elder man, as he stared into the face of the younger, traced in it, or persuaded himself that he did, an unmistakable likeness to the forgotten features of the woman who had so cruelly jilted him. The interview was a brief but stormy one. Sir Harry stigmatised the young man's suit as that of a mercenary fortune-hunter, and utterly refused to sanction his addresses in any way. So long as he retained his powers as guardian over Miss Fenton and her fortune, so long should Mr Evan Marchmont's suit be treated with contumely at his hands; indeed, his last words to him, as he pointed through the window, were: 'I would rather my ward should marry yonder crossing-sweeper than marry you.'

Sir Harry's first impulse after Evan's departure had been to seek an interview with Edeline, tell her what had passed, and bring to bear whatever influence he might possess over her in order to induce her to break with his nephew. But second and wiser thoughts prevailed. What if Edeline—who was a girl of spirit—should refuse to recognise his right to interfere between her and her private affections, and while to a certain extent submitting to his authority during the eighteen months she would remain under age, should avow her intention of holding to her engagement and of taking her own course in the matter, without let or hindrance, the moment her twenty-first birthday should have come and gone? In that case, he, Sir Harry, would be made to look considerably foolish, which he was by no means desirous of doing; in addition to which, he would have created a breach between himself and his ward which nothing could ever wholly heal over. No; he would bring to bear the wisdom of the serpent, if he could not pretend to imitate the gentleness of the dove. He would ignore the whole affair as far as Edeline was concerned; no word as to the interview between himself and his nephew should pass his lips. With Evan hard at work in London and Edeline secluded at Rothwell, there would be little or no opportunity for their meeting again for at least eighteen months to come, and there was no knowing what might happen meanwhile. In short, it seemed to him that opposition, if carried further, might only serve to fan the nascent flame of mutual affection between the young people, whereas, by quietly ignoring it, it might gradually fade and flicker out of its own accord. All this had happened nearly a year ago, during which time Evan Marchmont's name had never been mentioned either by Sir Harry or Edeline.

And now to return to the afternoon on which Therese Cobran asked permission to be relieved of her duties for a few hours on the plea of illness.

Fanny Dale kept a watchful eye on the clock on the nursery chimney-piece. Mrs Marchmont's tea was always taken to her at half-past five, to the minute. Two minutes before the regulation time Fanny quitted the nursery, closing the door behind her, and ran lightly down-stairs to the kitchen, it being the cook's duty to have the tea equipage in readiness. She would not be absent from the nursery more than three or four minutes at most, and no harm could possibly happen to

Master Frank meanwhile. She left him sitting in the middle of the floor, happy over a new toy; the window was shut, and the fire was protected by a guard. The day had been gloomy and overcast, and although the short afternoon was fast closing in, it was scarcely dark enough to light the lamp. The girl told herself that it would be time enough to light it after she should have taken Mrs Marchmont her tea.

After lingering for a minute's gossip in the kitchen, Fanny took the tray up to the small drawing-room. There she found Miss Fenton, who had just come in from riding, and, at Mrs Marchmont's invitation, had agreed to join her over tea. Fanny was accordingly sent down-stairs for a second cup and saucer.

It might be said of the widow and Sir Harry's ward that they were on good terms with each other, without there being any pretence of cordiality on either side. They had too few qualities or tastes in common to allow of their ever being attracted one to the other. They generally met at the breakfast table; but after that meal each went her own way, and they rarely saw anything more of each other till the dinner-bell once more brought them together.

Fanny having brought the second cup and saucer, at once went her way back to the nursery. She had not been gone more than seven minutes in all. The first thing she was aware of on opening the door was that the long window which gave on the balcony was wide open. With an exclamation of dismay, she made a hurried step or two forward and then paused, while her eyes went instinctively in search of the child. Nowhere could she see him! But the afternoon had darkened during her absence, and the corners of the room lay deep in shadow. Frank had a child's delight in hiding himself when nobody was about, and but for the open window Fanny would have felt sure of finding him crouched behind one or another piece of furniture. There were the toys she had given him to play with scattered about the floor, but the boy himself was nowhere to be seen.

'Frankie, Frankie, where are you?' called the girl in frightened accents. 'Why don't you speak, darling?' A moment she stood listening, but save for the wild beating of her heart, all was silence. Even yet she could scarcely realise the possibility of what had happened; but a brief agonised search in every corner and behind every piece of furniture proved to her, a minute later, that her charge was not in the room. Last of all, with a dreadful sinking of the heart, she passed through the open window on to the balcony. Here it was lighter than inside the room, light enough, in fact, to have allowed of her seeing any object out of the ordinary on the gravelled drive some eight or ten feet below. But nothing was to be seen. The drive on its outer edge was bordered by a narrow margin of turf, beyond which spread a dense shrubbery of laurels, rhododendrons, and other evergreens. Not a sign of life was anywhere visible. Leaning over the balcony, the girl, in half-choked accents, again called the child by name, while feeling sure there would be no response. For a few seconds she stood with her hands pressed to her head, striving to collect her thoughts, which kept fluttering and circling round her like a flock of frightened birds

of which she had lost all control. Then she said to herself: 'Perhaps he managed somehow to open the door, though I didn't know that he could, and has hidden himself in one of the empty rooms on purpose to frighten me.' But then came the terrifying question: 'In that case, why is the window open—and who opened it?' The child himself couldn't reach the hasp unless he were mounted on a chair, and the chairs were all in their places.

But it was imperative that action of some kind should be taken, and that without another minute's delay. 'I'll go and tell Therese before saying a word to any one else,' was the distracted girl's resolve. It was the instinctive impulse of a weak nature to seek the counsel and help of one stronger than itself.

ANCIENT REMAINS IN BENDERLOCH.

THE district called Benderloch (Ben-eider-da-loch, the hill between the lakes), which lies between Loch Etive and Loch Creran, is rich in both legendary and historic interest. At Ardochattan, opposite Achnacloich Station on the Callander and Oban line, there is an old priory, founded by the Benedictine monks in 1230, where Robert Bruce is said to have held the last 'Parliament' that was conducted in the Gaelic tongue. And away beyond Ledaig, in the direction of Loch Creran, are the remains of what is considered by some to have been the ancient Pictish capital of Scotland. On 'the Black Moss' of Connel there is a cairn under which the bones of Ossian are supposed to rest; and near the ruined fort or city just mentioned there is a mound, called *Tòrn Ossian*, on which the bard used to repose while meditating his lays in celebration of the might of his father, Fingal, and of all the wonderful heroes of that heroic, if mythical, time.

It was here, also, that the three sons of Uisnach held sway when they came over from Ireland, with the beautiful, wise, and witty Deirdre, or Dathula, of whom the Celtic bards have sung so much that is not easily reconcilable. But whether the Sons of Uisnach first went from Loch Etive to Ireland and then returned to their lovely Highland retreat, or whether they migrated originally from Erin to escape the wiles of King Coner of Ulster, we will not stop to inquire. It is sufficient to realise that in Benderloch we are in a region where myth and prehistoric legend—where poetry and chronology—are blended into a charming if somewhat perplexing tissue.

Entering Benderloch at Connel Ferry—Ossian's Falls of Lora, which are by no means terrifying, but yet sufficiently striking when, at ebb-tide, the waters of Loch Etive rush through the narrow and rock-bedded entrance to gain the open sound—one passes on to a flat tableland, variously called the Plain of Lora, the Moor of Ledaig, the Moss of Connel. Upon this Moor there is a great cairn, called the Baron's Cairn, which Dr Smith excavated, and concluded to have been of Scandinavian origin, and to have been a place where the 'Thing,' or Court, or Parliament, was held. This is interesting to remember, because Queen Hynde, who, according to one of the legends, once had her capital in this district, was very much troubled by the Norwegian king, Eric, who came

with a fleet and wanted to marry her. They stayed some time about the shores of Loch Etive, and were only got away by the intervention of St Columba. This may give a date to the event, and also some foundation to the belief that Queen Hynde was a Christian; but for the rest we are not prepared to guarantee the reality of her majesty's existence.

Further up Loch Etive, across this Moss, there is a still more wonderful cairn, that of Achnacree. It is extensive, and on excavation revealed various chambers; but what is its age and what its origin can only be guessed. It was doubtless meant for a burial-place, and it may perhaps mark the burial-place of Ossian, as many Celtic enthusiasts fervently believe.

It is more easy to believe than that this hollow which is pointed out at Achnaba, close at hand, was made by the cow of Cailleach Bheir when it lay down to ruminate. The hollow is about an acre in extent, so the cow must have been a biggish animal. Cailleach Bheir—or Old Wife Bera—needed most things on a large scale, for she could cross the loch here in a couple of steps, and her head, which is now turned to stone, is one of the great rocks you see on Loch Awe side. The reason she was turned into stone was because she neglected her duty to put a lid at sunset over a well on Ben Cruachan of which she had charge. She fell asleep one afternoon and forgot; the consequence being that the well overflowed, drowning both man and beast, and forming the extensive sheet of water known to the world, and dear to anglers, as Loch Awe. It was the rush of the mighty flood through the hills that formed the stern and wild Pass of Brander.

But let us turn across the Black Moss of Connel in the other direction, towards Ledaig, where lives John Campbell, the Gaelic poet. He is a good, kindly man; a wonderful gardener, who has made the rocky wilderness blossom with roses, and the bare hill-side gladden with luscious fruit, and on whom the poetic mantle of the famous Duncan Ban Macintyre has worthily descended. We must pass his house and round into Ardnamic Bay, commonly called Loch Nell, if we wish to see the site of the ancient Pictish capital, and the remains of the Halls of Selma, or the Fort of the Sons of Uisnach.

For here we are, according to the quaint, but credulous, historian Boece, in the region that first gave kings to Scotland—where they reigned in great splendour while barbarian England was yet undiscovered by the Romans. This was a land, if we are to believe the Aberdonian, where in prehistoric times there was a Court surrounded by men of learning, by sacred Druids, by skilled physicians, and by melodious poets, to whom ambassadors came from Spain long before the Christian era.

The story, condensed from Boece, is this. Three centuries or so before Christ, the Picts, the Scots, and the Britons in the southern parts of Scotland quarrelled; and the Scots sent over to Ireland to ask for aid. In response, Fergus, the son of an Irish king, came across, and was crowned king of Alban, as the western part of Scotland was long called. He made peace with the Picts; but the struggle with the Britons was continued until they were defeated, under King Coile, on the river Doon in Ayrshire—Burns's famous 'banks

and braes.' There Coile was slain, and there we find Coilsfield to this day. This whole district of Ayrshire is now called Kyle after him. After this great victory, Fergus built a castle in Argyllshire, and there reigned. This castle was called Beregonium, and Boece says that it was in Lochaber, but this is a mistake, for do we not find it in Benderloch? King Fergus was drowned on his passage to Ireland, and was succeeded by his brother, Feritharis, who had a peaceful reign, and made a treaty with Charlemagne. Then followed other kings, whose time was chiefly occupied in repelling the attacks of the Britons, until by a great effort of King Reuther, the combined forces of the Picts and Scots drove off the invaders. After that King Reuther went to live at Beregonium, 'where he died in peace, after having introduced into Albion many of the arts and sciences before unknown there.'

Beregonium continued the capital until the time of Ewin, who preferred the other side of Loch Etive. He built a castle, which he called Evonium, on the site now occupied by Dunstaffnage, and he was crowned there on the marble chair brought from Ireland. For a succession of reigns Dunstaffnage remained the capital, and then, with the Coronation Stone, it was transferred to Scone.

We have purposely refrained from giving any dates in this summary, because the chronology, like the story told, is mere myth. But the reader may be interested to have here the note which Bishop Pococke made of the place in 1760. The journal of the Bishop's tours in Scotland has long lain in manuscript, and has only recently been printed for the benefit of the members of the Scottish History Society.

The Bishop writes: 'We went on in the same beautiful country, having Lough Etive to the right, and came to the end of the mountains, which terminate in a perpendicular rock exactly like the ancient Ansur, now called Terracina, in the way from Rome to Naples. This rock was called Dun Vallin Re (the Hill of the King's Town), and by the Cromwellian soldiers, Craig Nuke; and this is the entrance, so the ancient city rock seems to have been called Vallin or Ballin Re (the City of the Kings). In the new map of Scotland it is called Beregonium, and seem'd to have been anciently the Chief City of Scotland; and I was told that Buchanan gives it that name. Cambden calls it Beregonium, a castle wherein the courts of justice were anciently kept; but what foundation there is for this name I cannot form any judgment. . . . A quarter of an English measured mile to the west is a Rocky hill extending a furlong from south to north, and close to the sea; this is called the Dun M'Sneam (the Fortress of M'Sneam). All over it are marks of the foundations of buildings. In the castle, &c., they show the place where the well was, and it is now so moist that Flaggs grow about it. From the other rock to this there is an elevated bank which is supposed to have been a street, and is called the Salt Market; there seem to have been houses towards the sea and to the north; there being a sort of terrace on each side; and to the north is a small bog, which might have been a pond to supply the town with water. There is a long stone on the south side of it. Before I came to the first rock, called Ballin Re, I saw two

cairns, consisting of heaps of stones. From the north end of this on the edge of a bog are signs of another street extending about a furlong to the west, toward another rocky hill, and this is called the Meal Market, which might be a suburb of the town. The sea seems to have left this place, for the ground between this last street and the sea consists of such pebbles as are on the beach. They have a tradition that the Scots from Ireland landed here.

The physical aspects of the place are pretty much as Bishop Pococke saw them one hundred and thirty years ago, although the 'streets' may not be so readily identifiable, owing to the spread of vegetation. But the Bishop is guilty of some confusion. It is not Dun Valanree that is called Beregonium, but the hill which he calls Dun M'Sneam. There was no such person as Sneam or M'Sneam. It is Dun Mac-Sniochan, or Mac-Uisneachan—the Hill of the Sons of Uisneach, or Uisnach.

There is no doubt about 'the tradition that the Scots from Ireland landed here,' and little doubt about the truth of the tradition. Where the doubt arises is whether the Scots from Ireland built this city or fortress, or whether they found it already built by the Picts, and merely occupied and enlarged it. Dr Angus Smith was of opinion that there are distinct indications of at least two separate sets of occupants.

Pennant, in his famous Tour, describes the ruins as that of a city which had been destroyed by a volcano; but that which he took for the effect of volcanic action is merely the artificial burning which is found in all vitrified forts. It shows that the place was built before the days of cement, and when walls were welded together by the application of great heat to fuse the stones.

The rock on which this fort stands is a mixture of limestone and slate; but the walls of the fort are of trap stones, brought from the hills near, which are readily fusible. Of the original height of the walls it is impossible now to judge, and it requires a strong imagination to perceive the lines of streets which some have professed to trace. But thanks to Dr Angus Smith's excavations, it is possible to gather a pretty definite idea of the character and extent of the settlement.

It occupies the whole summit of the hill, which is precipitous on all sides save one, where a gradual slope to what we may call the mainland, is still called the Queen's Walk or Street. On the sea-side it would be, in ancient times, practically inaccessible; and on the land-side it would be easily defended.

The buildings would cover a space about two hundred and fifty yards long by fifty broad at the widest part. On the broadest part, which overlooks the bay, appears to have been the chief's apartments, and probably all the most important dwellings, as it is farthest from the vulnerable side of the fort. These dwellings were planted between natural rock-walls on the north and south; while to the west there is a clear space reaching to the sea-precipice. The central living-place was measured by Dr Smith as thirty yards broad by about forty-five long. The remains of a strong inner wall are to be seen, which was built regularly as a protection to the dwellings in case of the outworks being taken.

Of this inner wall, about six feet in height remains, although the stones are now covered with grass. It was probably much higher. There were two courts, with a narrow passage between, which can still be traced.

So much for the chief's or king's palace; but no idea can be formed of the style of the apartments, now carpeted with moss and grass. All along the edge of the hill are to be found traces of vitrified walls, and on the western part, an inner wall runs along with them, with a space of about nine feet between. The vitrified wall is only built on parts which might be scaled, not on sheer precipices, and it is only vitrified on the outside. From this it may be supposed that the inner walls were more carefully finished, as in modern buildings, and the cross walls are never vitrified.

Among the débris have been found the bones of animals, evidently used for food, an iron brooch, and a piece of enamelled bronze—not much, truly, to tell of a great city such as Boece figured. But then, perhaps, if we were to dig deeper and farther, we might find more!

What has been made out, then, is, that the weaker parts of the hill were walled, and that the outer walls were vitrified; that the wall of the western parts was double; that the walls of the interior, whether cross walls or lining walls, were built without mortar; that the eastern wall of the inhabited portion seems to have been rebuilt by using some of the broken-down material of the vitrified portion; and that the occupation seems to have been continued after the ruin of the chief structure.

The evidences of vitrification explain easily enough the tradition about fire from heaven, as well as Pennant's volcanic theory. Now, Dr Smith says that this is the first instance in which regular dwellings have been found in a vitrified fort, and this fort we see to have been built by men who quite understood how to put dry stones together in layers. As vitrified forts are not common in Ireland, one cannot suppose that this city was built either by Boece's Fergus, or by the sons of Uisnach, who came from Erin.

What then may we infer? This, in all reason; that these ruins occupy the site of a very ancient fort, which may have been the stronghold of the Pictish chief. When the Dalriad Scots came over from Ireland, it is natural to suppose that they would occupy a nice, strongly-fortified town, if they found one ready to hand, and thus Fergus may have taken up his quarters in, although he did not build, Beregonium—at least if this be Beregonium. But as Fergus is somewhat mythical, we will prefer to think that the gallant sons of Uisnach took up their residence in the ready-made Pictish city when they came to settle on Loch Etive. Thus we may find a harmony in all the traditions.

As to the Pictish origin, there is evidence enough in the surrounding country of a considerable Pictish population. Tirefour Castle, on Lismore, is really a Pictish *broch*, and the present writer, in company with Mr Anderson Smith, the accomplished naturalist of 'Benderloch,' recently discovered on the shore of Loch Lianhe, within a couple of miles or so of Dun Mac-Uisnach, and within a still shorter distance of the Bay of Naisi (the eldest of the sons of

Uisnach), a small but remarkably ingenious *broch*, hitherto undescribed, which had probably been in a line of alliance both with that on Lismore, and that of which the Uisnachs took possession.

And then, if the Uisnachs were here, why not Fingal and Ossian and all their heroic throng? The dates are awkward, but then one must not be too critical of the chronology of ancient history. The small cluster of houses adjoining 'Beregonium,' as the natives have learned to call these ruins, is known as 'Selma;' and it is pleasant to think that this was really the site of the Halls of Selma also. This would imply that Fingal and the sons of Uisnach occupied the same fortress; and one need not have much difficulty in believing that, after reading Ossian's lament over the deaths of the three chiefs of Streamy Etha, and the beauteous Deirdre, whom he calls Darthula.

It is enchanted ground, at anyrate; and Picts, Dalriads, and Ossianic heroes alike, must have had a keen perception of the beautiful, as well as of the practical, when they made their camps here. From the heights of Dun Mac-Uisnachan, there is a glorious prospect of mountain, wood, and water; and if we cross the Bay and ascend the tower on the promontory yonder, we shall be rewarded by one of the most extensive and magnificent views in all broad Scotland.

THAT FOREIGN-OFFICE BAG.

I HAD just received an appointment as assistant in a consulate in the Far East, and had assumed an appearance as dignified and important as twenty-one years of age and a slight moustache would permit. The occasional large official letters I got marked 'On Her Majesty's Service,' and sealed with the Foreign Office seal, rendered me an object of the greatest interest in our gossip country village, for every one was dying to know what the Secretary of State for Foreign Affairs had to say to me. My happiness reached a climax one bright morning when I saw reposing on my breakfast plate a small white missive also marked 'On Her Majesty's Service,' but bearing in the corner the mysterious word 'Private.'

'By Jove,' I thought, 'this contains some State secret! Must be careful in opening it.'

A death-like silence reigned in our usually noisy family while I carefully slit the envelope with the bread-knife, and all eyes from baby, aged three, to the gov'nor himself were fixed on my countenance. I quickly glanced over the half-sheet of writing, and battled with the hieroglyphic-like signature for a minute or two. It was to the effect that Sir Algernon Chaldecott would be obliged if I would be good enough to call at the Foreign Office some day on the following week.

'Well!' was the universal exclamation, 'what is it?'

'Are you going up to Windsor?' said my younger sister; 'or is it an invitation to dine with Lord Salisbury?'

'Don't be cheeky,' I replied severely. 'You know nothing about it.'

'It is,' I added carelessly, addressing my father, who beamed upon me with a paternal eye of

admiration—'it is only from Sir Algernon Chaldecott—head of the Secret Service Department, I believe—who asks me to call at the Foreign Office, as he has an important communication to make to me.'

I duly went up to town the following week, and soon found my way to the stately pile of the Foreign Office buildings in Downing Street, which I entered, my young bosom swelling with pride, and my head higher in the air than ever. I was ushered into the presence of a grave-looking young man, whom I imagined to be Sir Algernon, and I accordingly made a profound bow, and said, 'Sir Algernon, I presume?' The grave young man smiled, and replied that Sir Algernon would appear presently. Then we talked pleasantly for a few minutes about the weather and the evil reputation of the climate of Carabaya, which was the name of my official post.

Sir Algernon himself suddenly appeared through a side-door, advanced and cordially shook hands—a condescension which thrilled every nerve of my body with pleasure—saying cheerfully at the same time: 'You are Mr Brown, I suppose?—Well, Mr Brown, as you are bound for Carabaya, we are going to take advantage of the opportunity to send by you some important documents, which it would be inexpedient to entrust to the ordinary post.' Here he held up a bulky white linen bag about two feet long, tied with red tape and sealed with an enormous quantity of red wax. 'I need hardly say, Mr Brown, it is your duty to take the utmost care of this bag; in fact, you should not let it out of your sight for an instant, till you have safely deposited it in the hands of Her Majesty's Consul at Carabaya.—Indeed, the State would much prefer you to lose your head than that you should lose this bag,' he added, blood-thirstily, though smiling all the time. He handed me the bag with a lofty air, and I received it with trembling hands.

'I will do my best, your lordship! I—I—mean—Yes, sir!' I stammered in my dread and agitation.

Seeing inexperience of this world traced in my youthful ingenuous features, he also seized the opportunity to give me a lecture on behaviour in general. He quoted something about women and wine which I did not catch—Shakespeare was never a favourite of mine—explained the ratio between steadiness and promotion, descanted on the vagaries of luck in the official world, and finally imparted the cheerful intelligence that promotion in Carabaya was more rapid than anywhere else, on account of the pestilential climate. I was standing all this time with the awkward bag in my hand; and a few minutes later, after Sir Algernon had repeated his awful warning about carefulness, I found myself emerging from Downing Street, at a loss how to carry gracefully a wretched thing which made me look like a grocer's boy with a Yorkshire ham. Not a cab was to be seen, and I walked up Whitehall imagining that the eyes of every passer-by were fixed on me. These feelings were not improved by hearing a gutter imp shriek out: 'Hullo! old chappie! 'Ow much a pound for yer 'am? Chuck us a bit, will yer?'

I hurriedly stuck as much of my burden as I could under my coat and took refuge in a passing 'bus. Here I was more at peace, though several

curious looks were directed towards me, and two young ladies fell into an interminable fit of giggling, of which I had grave suspicions I was the object. However, I reached home at last, and there I was treated with a respect, reverence even, which soothed my wounded feelings. The mysterious bag was minutely examined by every member of the family, and many were the conjectures as to its contents. The parchment label which was attached to the head of the bag with innumerable folds of red tape received a large share of attention. It bore the address of Edward Burleigh Gadfly, Esq., Her Britannic Majesty's Consul at Carabaya, and in the corner, written in large flowing style, was the single word 'Salisbury.'

'What a beautiful hand Lord Salisbury writes,' breathlessly ejaculated my younger sister.

'Oh yes,' I carefully explained; 'he has had so much practice in writing his name that he does it splendidly now.'

All that evening I was a hero in a small way, and did nothing almost but unlock my portmanteau and show the precious bag to successive troops of friends. At the same time I impressed upon them the utmost secrecy, as I had a lurking fear that I was breaking a diplomatic regulation in showing off a despatch bag in this public manner.

The next day I departed on my voyage to the East, and the six weeks of the journey were to me, I can truthfully say, six long weeks of the most refined torture. I was puzzled even how to get the invaluable bundle safe on board at Tilbury. To send it with my luggage, which went separately, was out of the question. I had no handbag into which it could conveniently go; so I ingeniously folded it inside a huge rug which was strapped up along with a lot of sticks and umbrellas. This I carried in my own hand, in defiance of the prayers of importunate porters and the remarks of jeering street boys. I stuck to it manfully amidst the terrible crush which takes place on board our ocean steamers at the hour of parting, even though I was compelled to take it up and hug it lengthwise to my bosom, to prevent the awkward sticks and umbrellas from driving my neighbours to desperation. It is not pleasant to hear some one fiercely mutter behind your back, 'What a deuced fool that long-legged goose is' (I was six feet and somewhat lanky). 'Why doesn't he put his abominable bundle down in the cabin, instead of poking everybody's ribs with it?' No; it is decidedly uncomfortable; but there was some consolation in knowing that it was endured for the sake of my Queen and country. It interfered even in the dreadful agony of parting with my dearest friends. I clasped the rug firmly with my left arm while shaking hands; but to get my handkerchief out I had to support my burden against the ship's side with my stomach, and there I stood huddled up, a picture of misery and despair, the bitter tears streaming down my cheeks, and my handkerchief fluttering mournfully in the breeze.

When my friends had finally disappeared, and I had cheered up somewhat, my next step was to descend to the cabin, bury the despatch bag deep among my shirts and socks, and carefully lock the portmanteau. I then hunted up the

steward, and with every look and movement betokening secrecy, led him into the cabin and cautiously shut the door. Pointing to the portmanteau, I told him that in it were some sketches and drawings which I valued more than my own life—he did not imagine that this was no mere figure of speech—that of course they were of no value to any one else, but I would be particularly obliged if he would keep his eye on the portmanteau when I did not happen to be in the cabin myself. The result of this little confidential chat was that one bright shining sovereign passed from my pocket to the steward's, who retired with many thanks on his lips, but in his inmost heart probably grinning in his sleeve—if such an Irishism may be allowed to express a state of mind.

In spite of this precaution I was still tortured with a vague uneasiness. That bag was on my mind during the day, and at night it always seemed to be on my stomach or tied tightly round my throat. Nightmare was my constant companion, and I often started up at night, banging my head with suicidal force against the bunk above, gasping and struggling for breath. I would see that impish bag get slowly out of the portmanteau, and with a wicked leer in its red-wax eyes, glide on spindle-shank legs up the cabin staircase. I had to rush after it in my *pajamas*, and then would ensue a heart-breaking pursuit round the deck, which generally ended by this fiendish phantasm taking a header over the side and kicking its ghostly heels in derision. I would make one desperate leap, and then would come the real bang on the head, which brought me back to my senses.

By daytime, of course, when reason reigned supreme, affairs were more cheerful. There were even occasions when, flirting mildly with some of the fascinating girls on board, I forgot my responsible position and really enjoyed myself. But these intervals were few and far between, though it certainly was not for want of pretty girls. Stopping at port was always a time of agony, and stoppages are so frequent on the way to the East. There was the 'Gib,' as the passengers familiarly called that grand old rock, Malta, Brindisi, Port Said, Suez, Aden, Colombo, &c. The notices which I saw strewed about warning passengers against thieves in the shape of pedlars, holy pilgrims, and fakirs, and announcing that the company would not be responsible for any loss, did not improve my equanimity of mind. When on shore and trying to amuse myself like the others, I was haunted with a dread that something might happen to that accursed bag, and I was always glad to get on board again and make sure by stealthy inspection that it was all right. At one place, Colombo, which has the reputation of being the worst place for ship-thieving on the whole Eastern route, I could not muster courage to leave the vessel. I announced that I had a severe headache, and went and lay down in my bunk with my portmanteau in full sight.

It was a great deprivation to give up Colombo. Every one was talking about running up the interior to Kandy, the ancient capital; and old travellers were loud in their praises of the magnificent tropical scenery to be seen on the way. I put my head through the porthole, sniffed in

the sweet perfumed breezes, and gazed upon the gleaming white Eastern buildings overshadowed by the waving palm-trees. It was very hard luck, I groaned; but *pro patria mori* was my motto, and in the cabin I remained, meal-times excepted, till the anchor was raised. I had some consolation, too, for my self-imposed confinement, besides that of revelling in my devotion to my country. One of the passengers was taken violently sick after returning on board, and the doctor declared that it was due to poisoning caused by eating fish that had fed on the refuse of the harbour. A pair of trousers also was actually stolen out of another cabin through the porthole. I congratulated myself on my vigilance, though on second thoughts it was rather difficult to see how a native could have dragged a two-feet portmanteau through a one-foot porthole, even supposing he had in some miraculous manner gained admission to the cabin. At anyrate, in my zeal I had erred on the safe side.

It was not long after leaving Colombo, that one blazing hot afternoon I retired below to suck oranges for the lack of anything better to do, and at the same time took the opportunity of seeing that the Foreign Office bag was still there. I dragged it out, and was conjecturing for the hundredth time what the contents might be. By dint of much thinking during the previous three weeks, I had pretty well settled in my own mind that it must contain at least a declaration of war against the native state whither I was bound. These cogitations were suddenly cut short by the entrance of my cabin companion. In an instant the despatch bag was again reposing among the shirts and socks, and the lock was shut with a snap. I fancy he saw the action, for he smiled. There was no reason whatever why I should have displayed any trepidation, but I was always nervous where the bag was concerned.

The longest road has a turning, however, and this miserable journey came to a termination at last. Behold your humble servant marching up to the British Consulate at Carabaya, sweltering under a tropical sun, a huge roll of rugs and sticks in one hand, and the other supporting a white umbrella. Like a good and faithful servant had I done my duty. It was an anxious but happy moment for me when I handed over the bag to Her Britannic Majesty's consul. He rapidly cut the red tape, and out poured a torrent of private letters, some for himself, which he leisurely began to read. There were also two official-looking letters, and three or four large blue-books. After Her Britannic Majesty's consul had glanced over his own letters, he turned his attention to the official ones.

My curiosity was strained to the highest pitch, and no—not if I was to be hanged for it, could I restrain my tongue. 'Is it to be war, sir?' I said in a tremulous and apprehensive voice.

The consul stared at me through his one eyeglass as if I had suddenly gone mad. 'What's that? What do you mean?' he gasped.

His glance frightened me. 'I only asked, sir, if it is likely to be warm,' I responded apologetically, happy to light on so easy an escape.

'Oh—ah—hum,' he replied, eyeing me suspiciously. 'Not more so than now;' and seeing the perspiration pouring down my face, he added: 'I would advise you, Mr Brown, to go and get

a bath, and be sure and souse your head well with cold water.'

I have since found out the purport of these documents; but as it would be an inexcusable breach of the first principles of diplomacy to reveal the secret, I must reluctantly leave my readers in ignorance.

EVERY YEAR.

I FEEL 'tis growing colder
Every year;
And my heart, alas! gets older
Every year.
I can win no new affection;
I have only recollection,
Deeper sorrow and dejection,
Every year.

Of the loves and sorrows blended
Every year;
Of the joys of friendship ended
Every year;
Of the ties that still might bind me
Until Time to Death resigned me,
My infirmities remind me
Every year.

Ah! how sad to look before us
Every year,
When the cloud grows darker o'er us
Every year;
When we see the blossoms faded
That to bloom we might have aided,
And immortal garlands braided
Every year.

To the past go more dead faces
Every year,
As the loved leave vacant places
Every year.
Everywhere the sad eyes meet us;
In the evening's dusk they greet us,
And to come to them entreat us,
Every year.

Yes, the shores of life are shifting
Every year;
And we are seaward drifting
Every year;
Old pleasures, changing, fret us;
The living more forget us;
There are fewer to regret us,
Every year.

But the truer life draws nigher
Every year;
And its morning star climbs higher
Every year.
Earth's hold on us grows slighter,
And the heavy burden lighter,
And the Dawn immortal brighter,
Every year.

WEATHER GOSSIP.

DWELLERS in our tight little island are often twitted by Continental neighbours for permitting the weather to monopolise casual conversation. The fickleness of our weather is as proverbial as that of fortune, and gives rise to inconvenience and grumbling. Rain spoils our scant summer holidays when we should be inhaling Nature's ozone at some seaside resort. The bracing breeze that last night promised well for a sail with a wet sheet and flowing sea, was but singing its death-song like the swan of fable. Next morning the white-winged yachts lie like 'painted ships upon a painted ocean.' Thaw sets in almost before skating has become an accomplished fact, and the newly-burnished skates are perforce put away to rust. Our seasons somehow appear to have become mixed, and that venerable oracle, the oldest inhabitant, hankers after the good old-fashioned Christmas of his remote youth. We have neither marrow-solidifying blizzards—as the Americans term their severe snow-storms, which deal death and destruction all around—nor torrid waves that parch up plants and enervate animals. It is the extreme uncertainty and inconstancy of our weather that is the trouble with us.

Explorers who have endured the extreme temperatures of the polar regions and of the tropics, express a preference for the regions of the Arctic. Exertion may possibly warm a man; but to keep cool under a vertical sun is out of the question. We happily enjoy the golden mean so bepraised by poets. Prayers for dry weather, or perchance for rain, are occasionally offered up in our churches; but a *Te Deum* is sung in certain West India places of worship at the close of each year's hurricane season. Gallant Benbow's remark respecting the climate of Labrador is to the point: 'There is a winter of nine months, and dreadful bad weather the other three.' It is jocularly asserted that the wind is sometimes so violent in Colorado that if a man should have had his hat blown off, he forthwith sends a telegram to the next leeward station in order to have

his head-covering stopped in transit. Our own weather is accorded an unenviable notoriety in the jingling rhyme of the *Ingoldsby Legends*:

In a climate so very unsettled as ours,
It's as well to be cautious and guard against showers;
For though about One, you've a fine brilliant sun,
When your walk or your ride is but barely begun,
Yet long ere the hour-hand approaches the Two,
There is not in the whole sky one atom of blue,
But it 'rains cats and dogs,' and you're fairly wet
through

Ere you know where to turn, what to say, or to do.

This is mild condemnation compared with that of the would-be convivial cheap tripper chafing under the burden of his wasted opportunities as he gazes ruefully at a leaden-hued sky and sodden surroundings. A tourist, rainbound in an hotel at Bala, is said to have vindicated his outraged sense of the fitness of things as follows:

The weather depends on the moon as a rule,

And I've found that the saying is true,

For at Bala it rains when the moon's at the full,

And it rains when the moon's at the new.

When the moon's at the quarter, then down comes
the rain;

At the half, it's no better, I ween;

When the moon's at three-quarters, it's at it again;

And it rains besides mostly between.

The belief that some connection exists between the moon and terrestrial weather is not so prevalent as in the days of antiquity; but this supposititious lunar influence forms the basis of tenacious weather proverbs. Even now, however, lunar tables for forecasting the weather are given in cheap diaries, and advocates are not wanting. Samuel Butler, in *Hudibras*, tells of a seer who

With the moon was more familiar
Than e'er was almanac well-willer;
Her secrets understood so clear
That some believed he had been there.

A story is told of a belated pleasure-seeker exasperated by a continuous downpour of rain while his barometer index pointed to 'Fair.' He took the offending instrument into the open air

and thus addressed it: 'Now, see for yourself, since you won't take my word for it.'

A barometer indicates the weight of the atmosphere above it, and is familiarly spoken of as a weather-glass, because changes in wind and weather attend changes in atmospheric pressure so long as the observer does not alter his position. If, however, he take his barometer to the top of a mountain, to the bottom of a coal-mine, or to some distant land, he would find that the words of weather-warning placed around its face would be utterly useless. Hence probably the unsuspected cause of our tourist's temper. Miss Braddon has almost exhausted her copious vocabulary in an attempt to delineate the characteristics of 'a bad, determined, black-minded November day,' on which the fog-fiend is all-powerful to persuade a miserable mortal to put a period to her existence. On the other hand, an amusing anecdote is related of the late Captain Fothergill, which tends to prove that even a foggy day may not be so black as it is painted. That commander, homeward-bound from protracted service in Indian waters, came on deck one cold morning in November when his good ship was running up the English Channel, cleaving her way through a dense fog. Addressing the officer of the watch, he said: 'Ha! This is what I call something like. None of your confounded eternal blue skies here. A fellow can see his own breath now.'

Personal peculiarities and poetic license account for much of the diversity of opinion on the weather. Our bodies are bad substitutes for barometers and thermometers. Many shudder at the idea of an easterly wind; and yet Charles Kingsley has given this bitter blast unqualified praise:

Welcome, wild North-easter!
Shame it is to see
Odes to every zephyr,
Ne'er a verse to thee.

Eliza Cook is probably more in touch with the generally received opinion where she sings:

But the north-east gale tells a different tale
With a voice of fearful sound,
When a loved one is under a close-reefed sail
On the deck of an outward bound.

Some verses attributed to the Hon. Mrs Wrottesley describe the beauties of Gibraltar, but recommend that it should be shunned when the wind is in the east:

Why do things turn all sour and musty?
And why has the mail not come in?
Why is everything out of doors dusty?
And everything dripping within?
Why has such a one murdered his brother?
For these facts, if a reason you'd find,
The same cause does for one as the other—
'Tis that horrible easterly wind!

Sir Henry Taylor advised a young friend not to prefer his suit when the wind was in the east, lest his lady-love reject him; and an old proverb would have us not ask a favour when the wind sits in that quarter. Every civilised nation has a Weather Department, issuing forecasts; but twenty-four hours is an extreme limit of certainty. Better than this cannot be done at present, and those who trouble to check the weather forecasted and that actually experienced

will obtain different results, even though they live near each other. Last winter, snow fell fast on one side of Westminster Bridge; but not a flake fell on the other side. No system of forecasting could have indicated this sharp line of demarcation. Scientists were once opposed to weather forecasting; and even now comic journals pillory our official forecasters, who claim that more than eighty per cent. of success crowns their efforts in all weathers. Some complain of the oracular nature of the warnings worded after the fashion: 'The Romans will conquer if the King be killed.' The question naturally arises, as to which King is meant. A warning was thus rendered by a four-year-old youngster, proud of his acquirements: 'It's to be fair and showery, with norf wind and rain; also warmer and snow by high wind and sleet when it clears.' Nothing like a mixture of all possible weather ingredients to ensure a semblance of success! 'Are you fond of fiction?' asked Brown. 'Yes,' answered Smith. 'The first thing I read in the daily paper is the weather forecast.' This unkind cut seems unwarranted. During the Soudan war, when gallant Gordon fell, it was asked: 'Why is the weather forecaster at the Meteorological Office like the Mahdi?' The answer is inevitable: 'Because he is a false prophet.'

Shakespeare said that 'jesters do often prove prophets.' He might with propriety have affirmed the truth of the converse of this proposition, for prophets often prove jesters. This is especially true of wilful weather and sporting prophets. Every one sets up as a weather prophet, no matter how small his stock in trade may be. An old grumbler being informed that storm signals would in future be made by the firing of cannon, declared that the expense might well be disregarded, provided that each gun were loaded with a weather prophet. Virgil gave an account of the weather signs known to the ancients, and refers to frogs as aids in weather forecasting. It would appear that these croakers are still held in esteem for that purpose. A precocious urchin heard a frog croak. He informed a young lady that rain would surely fall within twenty-four hours, as the croaking of frogs was an infallible sign. His prediction was accepted in good faith; but beautiful weather prevailed during the period. The fair one took her mentor to task. Equal to the occasion, he replied: 'Oh, well, now, the frog lied; and I'm not responsible for his morality.'

A shepherd lad always predicted when umbrellas would be wanted. He had noticed that an old ram used to twitch his tail vigorously whenever rain threatened. An old Danish proverb says that 'Almanac-makers make the almanacs, but God makes the weather.' A once famous almanac compiler was caught in a shower foretold by an hostler of the inn whence he had set out. He returned wetter, hoping to be wiser. Having 'tipped' the hostler to discover his method, the seer was disconcerted by its simplicity. The illiterate informant owned one of his questioner's almanacs, and having found that the weather forecasts therein were radically wrong, he was wont to assume that the weather would be the opposite of that specified for any given day.

When we recall the variability of our weather, it seems improbable that predictions for long periods can ever be successful. Who could have

foretold twelve months in advance with any accuracy the cool summer of 1890 or that of 1888, when July weather seemed to have been borrowed from March? It was suggested that the exceptionally large number of icebergs in the North Atlantic was a cause of our cool summer. Where is the man who can reconcile that theory with the fact that September was warmer than for twenty years past?

DUMARESQU'S DAUGHTER.

CHAPTER XXXV.—UNEXPECTED.

A WEEK or two later, Cyrus Vanrenen sat one brilliant Algerian morning under the shade of the drooping pepper-tree at the Orangers, discussing with his sister Corona the pros and cons of a serious move he contemplated in the game of life. To the western American mind, indeed, few things on earth are really serious; but this was one of them. Not, to be sure, that the question of getting married, or of whom you chose for your accessory in the fact, could be regarded as in itself a particularly grave one; but when the person contemplated was so very high-toned as Psyche Dumaresq—well, Cyrus felt that to propose outright demanded some unwonted previous deliberation. So he discussed it long and he discussed it earnestly.

'I guess, Corona,' he said decisively at last, 'I'll plunge on it to-day. You must plunge once. After all, at the worst she can only say *no* to me. Come to think of it, that's one of the shortest words in the English language.'

'The question is, though,' Corona answered, very demure, 'if you waited a little longer mightn't she feel a bit more like making a *yes* of it?'

'Well, I don't know for that,' Cyrus answered after a moment's reflection, with philosophic calm. 'A man never knows what he can do till he tries. I've bossed a pork-ring, so I don't see why I need shrink into my shoes before a woman, anyhow. I may be presumptuous—she's so particularly high-toned—but I somehow feel as if she kind of liked me.'

'That sort of girl don't marry a man because she kind of likes him,' Corona answered with prompt decision. 'She marries only when she loves him like—like anything, Cyrus. But there ain't much harm in trying, anyway. It *would* be a pretty good thing for the family, say, if we could feel you were marrying Haviland Dumaresq's daughter.'

'It would,' her brother repeated with emphasis. 'Folks would admire at it in Cincinnati.'

So Cyrus made up his mind for the plunge, and only waited for the fitting opportunity.

Now, opportunity, as is well known, comes in time to him who seeks it. It came to Cyrus soon after lunch, when Psyche, groping her way into the garden, sat down by herself on the stone seat in a far corner. She sat and gazed at the deep blue sky she could not see, and listened to the hum of the invisible bees murmuring among the fruit-trees. The low buzz of insects was dear to her now. Sound had come to replace sight. A

certain quiet calm possessed her soul. It was the resignation of despair stealing graciously over her.

Presently Cyrus strolled up as if by accident and sat down quietly on the bench beside her. Psyche made room for him gladly. The good young American was so kind and nice, so thoughtful and attentive, she really liked him. He began to talk to her, as he seated himself by her side, in an unconcerned way, as if he meant nothing: mere everyday talk of a gossip sort about the people in the *pension*. 'You like Sirena,' he said at last, in a very pleased voice, in answer to something Psyche had remarked. 'And Corona too. I'm sure you like them. It's a very great pleasure to me to find you like Sirena.'

'I love them both dearly,' Psyche answered with warmth. 'Except Geraldine Maitland, I think, Mr Vanrenen, I never met anybody I liked so much. In a *pension* like this, one gets to know and understand people's characters so thoroughly, you see. Everywhere else you choose your intimates: here, you have companionship thrust upon you, willy nilly. And it seems to me, the more you know the nice people, the nicer they become; and the more you know the unpleasant ones, the more do their disagreeable traits grow upon you.'

'That's so,' Cyrus assented with a pleased smile. 'And our girls outlive the test pretty well, you think, Miss Dumaresq?'

'They need no test,' Psyche answered warmly. 'They're just charming. Sirena's a dear, and I loved her almost from the very first moment I ever saw her. I think that's generally the way with me. I suppose my instincts are quick, or something of that sort; but whoever I like, I like instinctively; and whoever I don't like, I don't like from the very beginning.'

Cyrus leaned forward with an eager bend. 'And which did you do with *me*, Miss Dumaresq?' he asked anxiously.

Psyche started. 'Why, Mr Vanrenen,' she said with transparent frankness, 'how on earth could anybody do anything but like you? I don't think it's possible to talk to you once without liking you ever so much. You're so good and true. I should think everybody always liked you.'

Cyrus's heart was in the seventh heavens. 'Thank you, Miss Dumaresq,' he said in a rather low and gentle voice. 'That means a great deal to me, I can tell you: a great deal more than you imagine, I'm certain. Indeed, there's something I want to say to you about that. Ever since you came here—'

He broke off short, for Psyche, anticipating what he was going to say, had risen from her seat with a little startled cry, and was groping her way back toward the *pension* in dismay. Cyrus's tone had told her all. It was dreadful, dreadful. This was something for which she was wholly unprepared. In her deep, deep sorrow, to have *this* thrust upon her! And by any one so kind and good as Cyrus! It grieved her to the quick that he should have blundered into so sad and hopeless a mistake. The Vanrenens' friendship had been very pleasant to her; the one bright spot in her desert of trouble: and now, this painful and unexpected *contretemps* would spoil all: she could never feel again as she had hitherto felt towards

them. She groped her way on, and made blindly for the door. Cyrus, all abashed, but watchful and kindly still, walked by her side, and guided her movements almost imperceptibly.

As she reached the door, she turned round to him, crimson, but very gently. 'Thank you, Mr Vanrenen,' she said in her soft sweet voice. 'I'm so much obliged to you for your silence and your help. You saw how I felt. That was more than kind of you.'

'And I mayn't say more?' Cyrus asked, half trembling.

'Not at present,' Psyche answered, hardly knowing what she said. 'You—you took me so much by surprise, you know.—I wasn't expecting it. Some day, perhaps, I'll tell—Sirena or Corona everything I feel. But not now. I can't bear it yet. Please go, Mr Vanrenen. There's Geraldine come to have her set at tennis with you.'

Cyrus, obedient as always, raised his hat, though he sorely wondered what Psyche meant. But these high-toned women are always so hard to understand. They don't say what they mean right out: they talk round and round things. Their feelings are more than a fellow can fathom. But you've got to accept them. You must take them on their own terms or give the pursuit up altogether. They won't be anything except themselves. So he turned on his heel, and descending to the tennis-court, took his seat quietly beside Geraldine Maitland.

As for poor Psyche, much moved and disturbed by this untoward event, she took refuge for a while, of set purpose, in the little salon; for if she had gone to her own room, she must have burst into tears and cried her eyes out. Her father was there, reading a book on the sofa; and Corona, too; she could just make out a vague blur for Corona. So she glided in, and sank into a seat. Haviland Dumaresq glanced up from his book as she entered and smiled approbation. She had made her way to her seat without much difficulty, and now she was gazing, by no means vacantly, around the room. He was sure by the intelligent look in her eyes that Psyche was really taking in and observing the various objects.

And so, in the excitement of the moment, she really was. To conceal her agitation, to hide her misery, she was looking about her with all her eyes at the things in the room. And what was more, she saw them—she saw them.

A newspaper lay on the centre table of the salon. Psyche could make it out quite distinctly as a dim white patch from the place where she sat on the low divan between the two arcaded Moorish windows. Partly to please Haviland Dumaresq, partly to hide her pain and distress, she made up her mind to try and read it. Her father was always urging her to read, and so was the doctor, and Sirena too, and Corona, and everybody. If only she would rouse herself, they said—one effort of will—all might yet begin to re-establish itself. Well, then, she would: she would do it to please them. With that firmness of purpose which ran in the very blood with her, an inheritance of character from Haviland Dumaresq, Psyche determined that, swim and dance as it might, she *would* make it out, she *would* read it. She would show them all she could at least try hard: she would not be beaten

by mere dead circumstance without at any rate one more stern struggle.

After a moment's pause, she rose from her seat again, and groped her way across the room firmly. Corona saw her, and rising in concert, glided across to take her arm and lead her to the table. But Psyche waved the friendly aid aside with an imperious gesture. She wanted to do it all by herself. She stumbled across the vacant space to the table with doubtful feet, and took up the dim white patch in her trembling fingers. Her father watched her furtively above the top of his book. Looking hard at the title, and concentrating her gaze, she saw to her surprise that she could still make out the big print letters. It was the *Dépêches Algériennes*, and it was dated *Jeudi, 26 Février*. Pleased at her success, she turned back to the window, and seated herself once more on the low divan, where she tried to spell out the matter of the telegrams.

As she gazed at them vacantly, a word in the second column caught her eye on a sudden; a word that no longer swam or danced, but stared at her straight and hard in fast black letters; a word that she could have seen, she felt, if she were stone-blind; a word that burned itself then and there into her very brain.

A single English name!

The name Linnell, as clear as daylight.

She almost cried aloud with horror and surprise: horror, and a certain vague indefinite fascination.

She knew he was dead: it was the certainty of his death the paper announced. Some straggler from the Soudan must have brought to Algiers the terrible tidings. Better the certainty than suspense any longer.

For to Psyche, there was but one Linnell in the whole wide world. What to her were baronets or parsons or British officers? The name must needs be his, and nobody else's.

With a terrible effort, she restrained herself from calling out, she restrained herself from fainting. Cold as death, she concentrated her glance once more upon the paper.

Science was right. It needed but a strong exercise of will. As she focussed her eyes upon the dim white sheet, letter after letter came out distinctly, in blood-red tints, till she could make out the key-words of the sentence easily: they glared at her from the page like liquid fire: they were: 'Biskra'—'Linnell'—'Khartoum'—'Gordon'!

She bit her lip till the blood came, almost, and dug the nails of her clenched left hand deep into the palm to increase the stimulus. She was striving hard enough now in all conscience. Her father and the doctors could find no fault with her.

Slowly, slowly, those critical words blazed out more distinctly and plainer still. Line after line gradually arranged itself. The colours only seemed all gone wrong. They glowed so fiercely, like molten gold, she could hardly look at them. But she looked for all that: she looked and shuddered. And this was what she read, in telegraphic French, written as it seemed to her in crimson letters on a burning ground of fiery orange.

'Biskra, Feb. 24. Arabs from the oases announce to-day that a caravan now crossing the

desert convoys a survivor of Gordon's army at Khartoum, cut off by the Mahdi in the course of last winter. From the description given, it would appear that the fugitive is probably an Englishman, whose name the Arabs assert to be Sir Linnell. In effect, an officer of that name is known to have been missing after the fall of Khartoum. The caravan is expected to reach Biskra some time about the 6th proximo.'

Psyche's strength held out till she had finished the telegram. Then she fell back on her seat, and swooned away suddenly.

A FRENCH CONVICT COLONY IN THE SOUTH PACIFIC.

In olden times Botany Bay, our British convict settlement, was considered to be about as distant a corner of the world as could well be found for the transportation of moral offenders. But France has found a still more distant place to serve as a national dust-bin, a receptacle for the refuse of French society. The traveller who would journey thither must first traverse half the globe to the farthest Australian port, and there trans-ship and begin another, though a much shorter, voyage to his destination.

It was a bright June morning when our boat steamed out of Sydney harbour into the great Pacific Ocean; though, by the way, there are times when the poor sea-sick passenger thinks that that ocean should have been called Terrific rather than Pacific. When about a thousand miles had been accomplished, all eyes were directed towards a lighthouse close on our right. The lower part of this useful edifice is a comfortable dwelling-house, and the tiny coral island upon which it is built is a garden of tropical verdure, and only a few miles from port. What a contrast between this nice little island home and other lighthouses that we have seen, on desolate, weather-beaten, out-of-the-world shores, where some poor fellows while away their days, months, or years almost or quite alone! The outline of mountainous land was visible ahead; and around us were several little coral islets in full view, with their lofty palm-trees standing up clear against the sky.

By-and-by the inner harbour is reached, and a town of considerable dimensions lies before us; this town is Noumea, the capital of New Caledonia. Round-topped hills and long ridges rise irregularly behind the town. Some of these are somewhat barren, and not unlike the mountains of Scotland after which the island was named; but among some of the gorges, valleys, and slopes there is a thick growth of tropical vegetation. On going ashore, the traveller is obliged to admit that, though he has travelled so far, he has not yet got outside of the pale of civilisation. Noumea has its grand square, surrounded and intersected by acacia avenues. Here the 'fashionable' of the town walk or sit or lounge while a dozen convict bandmen discourse music inferior perhaps to nothing of the kind to be heard in the southern hemisphere. The population of Noumea is about three thousand. Frenchmen form a large proportion: but there are also Englishmen, Germans, Italians, and many South Sea islanders. The streets are narrow, and rather

'continental' in appearance. Names, signs, notices, &c., are of course in the French language. The houses are more open to public gaze and intrusion than one finds in any colony of home-loving Anglo-Saxons, even in a tropical climate; and the military and government officers hurrying through the streets, or standing at their posts of duty, have the dainty finish of dress and general appearance peculiar to Frenchmen. There are general stores at which you can buy anything from a pound of candles to a suit of clothes; and tailors, chemists, photographers, and book-sellers display their goods in the windows. In some streets the courtyards and verandas are shaded and beautified by banana trees, ferns, and cocoa-nut palms. Along the shores skirting the harbour and up the hillside are some very pleasant residences. A fine Roman Catholic cathedral has just been built of stone, and a small French Protestant church is in course of erection. The roads into the country are excellent; and cabs and other carriages can be procured for pleasure-trips inland.

The chief feature, however, is the convict element. Gangs of men, clean-shaven and arrayed in drab uniform, march in order to and from their work every day. They are employed in making bricks, constructing roads, and in general public works. Their life is not a hard one if they behave themselves; but insubordination or attempts to escape often result in positively brutal treatment at the hands of European and native warders. As one gazes upon the faces of a gang of these men, the curious inquiry arises, what tales of misfortune and crime could these miserable fellows unfold? Is there a man among them innocent of the crime laid at his door? No doubt, it has been the lot of some to be dragged away from home and friends and all society, and doomed to spend many a weary year as a convict among convicts, without a hope of freedom again in this life—no doubt, this has occasionally happened to innocent men. Who but the Almighty knows the bitterness of such a life? It would not do of course to credit all that convicts have to say of themselves. As in Australia fifty years ago, so now in New Caledonia, the first thing the convict tells his interrogator is usually that the police took 'the wrong man.' A conspicuous notice is posted up informing visitors and all civilians that speaking to a convict or giving tobacco, newspapers, or the like renders the offender liable to arrest and imprisonment. Before we had spelled out this important notice, however, or even suspected its existence, we got into conversation with an intelligent young fellow who spoke English well. His story was—and there seemed to be an air of truthfulness about it—that he was quite innocent of the embezzlement with which he was charged, and for which he was transported. Indeed, his innocence had now, after four years, been proved, and 'a free pardon' was expected by the next mail. After penal servitude for a certain term, some are allowed complete freedom within the limits of New Caledonia; but any attempt to pass beyond these bounds brings upon the fugitive, if caught, harsh treatment probably for the rest of his life.

Attempts to get away to Australia by open boat—a distance of eight hundred miles—are

comparatively common. Many of these attempts are discovered before a start has been really made; and those who succeed in getting out of French waters do not all live to see land again. A few, however, every year manage to reach the Australian coast, and they fondly imagine that their dangers are all over when they have once set foot upon this free land; but even then these hopes are, perhaps oftener than not, doomed to disappointment. As a rule, they land on these shores penniless, half-starved, and probably able to speak only a few words of English. Under such circumstances, it is almost impossible to pass themselves off as anything else than escaped convicts from New Caledonia; and as the Australian police keep a very vigilant look-out for such characters, there is little chance of ultimate freedom. The people of Australia generally profess considerable alarm lest the influx of these French criminals should pollute Australian society. No doubt, a certain percentage of the few who reach our colonies would remain there and would resort to dishonest methods of living; but it is felt by many that our police exceed their duty when they hunt up men whose original offences were trivial, and who show a disposition to become honest citizens—when they arrest such men, just rejoicing in their new-found liberty, and hand them over to the tender mercies of French warders.

But let us turn again to the gang of convict labourers being marched through the streets of Noumea! We cannot read their histories in their faces; but we may rest assured of this, that many of them were missed from their native villages and streets in far-away France in such a manner that no one regretted their absence or bestowed as much as a passing tear upon their memory. But there are also young men who have mothers, wives, sisters, or brothers in the land of their birth, who mourn the disgrace and calamity of those who were once the mainstay and the pride of the home. It may be that they themselves, or some of them at least, suffer from remorse, now that they realise the wickedness and folly of their deeds.

Very recently an aged woman gathered money and strength and courage to journey to the other end of the world to carry out a scheme that she had devised for the escape of her son, who was a convict in New Caledonia. Inspired by a mother's love, she actually succeeded in reaching Noumea, where she lived for a time among the civilian population and managed to communicate with her son. By-and-by the screw steamer *Rockton* was about to start for Sydney, and this old woman was a passenger. Without exciting any suspicion whatever, she had succeeded in getting on board a large box very plainly marked 'This side up.' When the ship had actually cleared the wharf, a sailor, regardless of these instructions, turned the box upside down, and was at once attracted by some commotion inside. This was reported to an officer, who in turn called a policeman from the shore and had the steamer stopped. The box was of course examined, and it was found that the lid had hinges and a bolt inside, and the contents were an armful of straw, a bottle of water, several boiled eggs, and the convict son of the old woman. They had purchased a ticket to Sydney for him, and it was intended that he

should emerge from his hiding-place at night and take his place among the other passengers. Perhaps the ends of justice were met more fully by the return of this man to his bondage; but who can fail to feel sorry for the poor old mother, who, after such patient efforts to rescue her son, and having so nearly brought her clever plan to a successful issue, had to retrace her weary steps back to France with the knowledge that her son's lot had only been made harder by her endeavour to bring him home again.

The convicts, however, who suffer most in consequence of unsuccessful attempts to gain their liberty are those who run away into the bush, and are recaptured by native police, who are let out like bloodhounds to hunt the wretched runaway. A leading citizen of Noumea told me that he had himself witnessed disgraceful cruelties on such occasions. Every convict, I suppose, whether in Australia, or Siberia, or New Caledonia, learns the lesson that 'the way of transgressors is hard'; but it does not appear that the French authorities are on the whole less just or less kind in their treatment of criminals than British authorities are, or at least than they were to Botany Bay convicts a generation ago. Some influence has been brought to bear upon France, in the interests of our colonies, to induce her to stop the exportation of criminals to the South Pacific; but a great deal of money has been spent in preparing New Caledonia for the settlement of convicts; moreover, France is determined to extend rather than curtail her interests in that part of the world; and as her people are not good colonisers, the transportation system is considered to be the best method of peopling this southern land. When the convict has served his term of hard labour he has every opportunity of making a home for himself.

But we must return to Noumea. The stranger, especially if he be from a white-man's land, such as England, will be struck by the number and variety of dark-skinned people to be seen in the streets. Many of them are from the New Hebrides and the Loyalty Islands, whilst others are specimens of the aboriginal inhabitants of New Caledonia. These last-named people are much more of the negro type than are the Fijians, Samoans, or Tongans to the east of them, or even than the Australian blacks are. Their skins are sooty black, their hair black and woolly, and their features not quite so thick as those of African negroes. In their native haunts they go practically naked. In the streets of Noumea, however, they wear a kind of skirt from the waist to the knees, and in some cases a thin vest or jacket. The girls wear thin European dresses, hanging loosely about them. Large numbers of them, male and female, are employed as household servants, others are general labourers. Some are native police; and others, again, are prisoners, locked up by night and escorted to their work by day. A New Caledonian native house resembles the roof of a round wheat-rick, but only raised a few feet from the ground. They live in tribes, and were originally warlike and of cannibal propensities. Their conquerors have had some little trouble with them. A few years ago they rose in rebellion and massacred a number of European settlers and threatened Noumea itself. Now, however, they seem to be quite settled,

and European settlement is spreading all over the island.

A large portion of the southern end is almost worthless, but there are other districts in which plantations and cattle stations thrive. The mineral resources also are being developed, and there is every prospect of a steady increase of European capital and population. Roads and telegraph wires extend the whole length of the island (two hundred miles). The scenery in some parts is exceedingly fine. Palms, acacias, ferns, bamboos, and tall grasses grow luxuriantly; and the red and yellow flowers of the hibiscus tree, together with brilliant flowers of creeping plants, add brightness to the novelty and richness of the tropical forests. The mountains run up to six thousand feet above sea-level, and their summits, slopes, and gorges, with the intervening valleys, form very grand landscapes.

In New Caledonia the French have a valuable possession. It is to be hoped that their administration will be just and humane as regards the native tribes that come under their rule, and that they will so use their power in the South Pacific as not to become offensive to England, whose claims and interests in those regions are so much greater.

THE HEIR OF ROTHWELL CHASE.

CHAPTER II.

FANNY DALE raced up the thickly-carpeted stairs which led to the upper floor as she had never raced before, and burst into Therese's room, the door of which had by this time been unlocked. Mrs Marchmont's maid had put away her French novel and resumed her ordinary attire. At the moment of Fanny's entrance she was arranging her hair in front of the glass. She turned in the act of thrusting a long pin through one of the coils, and regarded the panting, frightened girl with coldly-questioning eyes.

'O mamzelle—the child—Master Frank—he's missing!' blurted out Fanny.

'Missing! What do you mean by missing?'

'He's gone—I can't find him anywhere. When I left the nursery to take missis her tea, he was playing quietly among his toys; but when I got back he was gone and the window was wide open. Oh! what can have become of him?—You—you haven't seen anything of him, have you?'

'Nothing whatever. How should I? As you must know, he would never come here of his own accord.'

Fanny knew that quite well. To her mistress Therese might pretend to be as attached to the youthful heir as Fanny was in reality; but the latter knew how hollow was the pretence, and that Therese disliked all children without exception.

'Perhaps he has shut himself in one of the empty rooms on purpose to frighten me,' went on the girl. 'Oh, do come with me, mamzelle, and help me to look for him!'

'Certainly I will, Fanny. You may depend on it, the little imp is only playing you a trick.'

Then, after a moment's thought, she added: 'But you say the window was open when you got back. That looks strange, very strange.'

Fanny began to whimper. The other gripped her by the arm. 'Don't make a fool of yourself,' she said; 'at least, not till you have made sure that there is nothing else left you to do.—*Venez.*'

They went quickly down-stairs together; and Therese taking the lead, began at once a systematic search of the rooms, of which the nursery formed one, on the floor below. They were chiefly spare bedchambers, none of which, except on rare occasions, had been occupied for years. The bedrooms used by the family opened out of a corridor reached by another staircase on the opposite side of the entrance-hall, or otherwise through the picture-gallery, into which latter apartment, in the faint hope of finding the missing child there, Therese and Fanny now ventured, but, of course, to no avail. The door at the opposite end of the gallery, which gave access to the other wing of the house, being locked, was sufficient proof that Master Frank could not have made his way into the rooms beyond. There now remained only the small drawing-room; but, as Fanny said, how could the child possibly be there, when it was from that room she herself had gone direct to the nursery after her second journey below stairs?

It was to the nursery that Therese and her white-faced companion now mechanically bent their steps; their search had not occupied longer than six or seven minutes in all. The nursery was just as Fanny had last left it, the toys scattered about the floor, and the window wide open, except that by this time the room was nearly in darkness. The first thing that Therese did was to light the candles in the girandoles over the chimney-piece, then turning to the girl, she said: 'But one thing remains to be done, and that is, to tell Mrs Marchmont.'

At these words, Fanny dropped on her knees and broke into a tempest of hysterical sobs and tears. 'I daren't tell her—I daren't tell her,' she exclaimed. 'Oh! what shall I do?'

'If you dare not tell her, I must,' replied the Swiss without the slightest change in the low, even inflections of her voice.

'Oh, if you only would!' moaned the girl through her sobs.

For a moment or two Therese stood regarding the crouching figure before her with a stare of chilly contempt. In her eyes, half-veiled by their white lashes, was the glitter of a malignant triumph. Without a word more she quitted the room, and traversing the corridor with the noiseless stealthy tread of some soft-footed predaceous creature, she tapped lightly at the door of the small drawing-room; and then, after a moment's pause, during which a film, so to speak, gathered over her eyes and robbed them of all expression, she turned the handle and went in.

Strong woman though she was, Mrs Marchmont seemed to reel under the shock of Therese's news, briefly and clearly told by the waiting-woman. She pressed her hand to her side and for a moment or two was powerless to speak. Her first words were an order to Therese to summon Sir Harry, who was engaged with his

steward in the library. Then, accompanied by Miss Fenton, who was scarcely less shocked than she, Mrs Marchmont hurried to the nursery, where Sir Harry made his appearance two minutes later. Fanny Dale, a limp, grovelling figure, was powerless, in the utter abandonment of her despair, to answer any questions coherently. The baronet, to whom her moans and bewailings were irritating in the extreme, sternly ordered her to her own room, and then turned to the composed Therese for the particulars he had failed to elicit from the nursemaid. Three minutes sufficed to put him in possession of all there was to tell.

'It's a pity—it is a thousand pities,' he said, when Therese had come to an end, 'that so much time has been wasted in searching the other rooms, when it is self-evident that the child has been carried off by some miscreant by way of the window. You ought to have summoned me immediately the boy was missed. However, no more time must be lost. This room must be left exactly as it is till the arrival of the police.—You, my dear,' turning to Mrs Marchmont, 'had better go back to the drawing-room; and Edeline will keep you company.' He spoke very quietly and collectedly. It was only by the spasmodic opening and shutting of his hands that he betrayed how deeply he was affected by the mysterious disappearance of his grandson and heir. With that Sir Harry went his way, and the two women returned slowly and sadly to the drawing-room. Therese, finding she was not wanted further at present, had already vanished.

Five minutes later, Tom Abrey, the groom, was spinning along in the dogcart on his way to Berriemfield to summon the police, while in the huge flagged kitchen were already assembled the gardener and his assistant; the coachman and two stable helps; the butler, who quivered like a blanc-mange in human shape; a couple of stalwart but overfed footmen; the gamekeeper and his underling; Dickon, the half-witted man-of-all-work; and lastly, Sir Harry, with Mr Warde, the lame land-steward. (After Lady Marchmont's death, the establishment at the Chase had been considerably cut down.) The baronet's questions with the view of ascertaining whether any suspicious characters had been seen loitering about the house or grounds having failed to elicit any information, the little company was divided into three parties, Sir Harry taking charge of one of them, the gamekeeper of another, and the gardener of the third. Each party took lanterns, and each man was armed with a stout cudgel, of which the gamekeeper had an ample supply in stock. Then, after a few final instructions, they all filed quietly out by way of the back entrance, watched from a distance by the women portion of the below-stairs establishment, behind whom, silent but observant, stood Therese Cobran. As soon as the door was shut behind the last man, Therese turned and went slowly up-stairs without speaking to any one, a faint amused smile flickering round her thin lips; but it was not a pleasant smile by any means. 'Poor Sir Harry!' she remarked to herself with a shrug. 'I am afraid that he and his men will come back no wiser than they went.'

In the small drawing-room sat Mrs Marchmont and Miss Fenton, one on each side of the fireplace, waiting and listening for the tidings which any moment might bring. They spoke but little to each other. Edeline, who had dearly loved the lost boy, and had made far more of a pet of him than his mother had ever condescended or cared to do, would fain have sympathised with Mrs Marchmont had she been permitted to do so; but such timid overtures as she ventured on were so coldly received by the widow that her feelings shrank within themselves, as the petals of a delicate plant shrink and shrivel before the first breath of frost. Mrs Marchmont was one of those women who are sufficient unto themselves, who, how heavy soever may be the burdens they are called upon to bear, not merely scorn to crave the sympathy of others, but repel it even when offered unasked.

And yet, deep rooted in Mrs Marchmont's heart was a passionate love for her child; but even to the object of that love her betrayals of tenderness—her moments of weakness she termed them to herself—were brief and infrequent. For the ordinary fond and foolish mother whose happiest hours are those she spends among her darlings, she had nothing but a feeling of quiet contempt. They were poor invertebrate creatures, with whom she was glad to feel that she had nothing in common. Frank had a child's intuitive consciousness that his mother loved him; but her caresses were matters of such rare occurrence that he almost shrank from them. In point of fact, his love for his beautiful and stately mamma was over-weighted with a sort of awe—not fear, be it understood—so that it was always a relief to him when the drawing-room ordeal was at an end and he was at liberty to race back to the nursery, where laughing, sweet-tempered Fanny Dale more than made up to him for whatever he lacked in the way of caresses elsewhere.

The Chase was so large and some parts of it were so far removed from the domestic offices, that our two ladies were unaware of the return of the search-party till Sir Harry in person opened the drawing-room door and walked in. Both of them started to their feet at his entry; but his face told the news he brought before his tongue could frame a syllable. It seemed to Edeline that he looked five years older than he had looked at luncheon a few hours before. He sank into a chair with a groan.

'You have not found him!' said the mother with a constriction of the throat which all but choked back her words.

The old man shook his head dolefully. 'No, we have not found him,' he answered hoarsely. For a few moments he was powerless to say more.

A deep sigh that was almost a sob broke from Mrs Marchmont, and then she sank into her chair again. Edeline's heart went out towards her, but encountered no responsive chord. The widow's face might have been nothing but a beautiful mask for aught it betrayed of whatever feelings and emotions were at work below.

Presently the baronet cleared his voice. 'Every square yard of the gardens and shrubberies has been searched,' he said, 'and the park

itself thoroughly examined, but to no purpose. Yardley, the superintendent of police, has just arrived with two of his men, and I am now going to consult with him as to the next steps it behoves us to take.'

That night, was one which the inmates of Rothwell Chase were little likely ever to forget. Although the telegraph had been set to work and the country was being scoured in every direction by the mounted constabulary, hour passed after hour without bringing tidings of any kind. It was long after midnight before the household separated. Mr Warde had kindly offered to remain up all night in case of the arrival of any news, which he would at once communicate to his employer; and his offer had been accepted. It was with a heavy heart that the baronet kissed his daughter-in-law and bade her good-night. At the foot of the stairs Edeline offered him her arm without a word, and without a word he took it. Never had he felt the need of help as he felt it to-night; never had the burden of his years seemed to weigh so heavily on him before.

Therese, who seemed to have quite got over her temporary indisposition, was waiting for her mistress when the latter reached her dressing-room. She was much too astute a person, and read her mistress too thoroughly, to venture on any spoken expression of sympathy. To have done so, as she was well aware, would have merely resulted in a snubbing. But sympathy may be conveyed by manner, by an inflection of the voice even, and, more subtly still, by an indefinable something in the mere act of administering to the needs of those whom it is our privilege to serve in a subordinate capacity. And after such a fashion it was that Therese strove to convey her sympathy. It is to be presumed that she was successful in her efforts, seeing that Mrs Marchmont's last words as she quitted her for the night were: 'You are a good creature, Therese.'

Therese paused outside the door and laughed a low sardonic laugh. 'I'm a good creature, am I, madame? To hear you talk, one might take you for a duchess born, instead of for what you are—the daughter of a wandering fiddle-scraper. But it may be that you will have occasion to change your opinion before you and I have done with each other.'

Next morning, while the family were at breakfast—such a breakfast as they could eat—Inspector Dimwade from Scotland Yard was announced. Superintendent Yardley had met him at the station, and they had driven over together to the Chase, the inspector being put into possession of the facts of the case *en route*. It may be here remarked that, so far, the efforts of the police had been productive of no result.

Inspector Dimwade was a man of five-and-forty, or thereabouts, with a florid complexion and a somewhat full habit of body, sandy hair and short side whiskers to match. He had a pleasant smile and a quietly plausible manner, which he found of great service to him in his profession.

When the consultation with Sir Harry had come to an end, which it did in the course of a few minutes, Inspector Dimwade asked to be conducted to the nursery. On entering the room he walked at once to the window and submitted

it to a close examination, fastening and unfastening the hasp several times, and then with his eye measuring the height of the balcony from the ground. Then he instructed Yardley to shut the window while he remained outside. This being done, he proved, by means of the blade of his pocket-knife, what an easy thing it was for any one to force open the hasp of the window.

'You have certainly scored a point there, Mr Inspector,' said the baronet as Dimwade re-entered the room through the window he had so readily opened. 'But before a man could do what you have just done, he must get into the balcony from below, and how, pray, would he manage that?'

'Pardon me, Sir Harry; I have not implied that the nursery was entered from the balcony. I merely wanted to satisfy myself that it could have been. I think I understood you to say when we were in the library that there are several unoccupied bedrooms on this floor which are rarely entered by any one but the chamber-maid whose duty it is to keep them in order?'

'That is so,' responded Sir Harry.

'As a matter of course, such a house as the Chase must have a number of doors. To begin with, there is the main entrance; then there is the side-door through which Mr Yardley and I were admitted; I noticed, too, a door in the conservatory; and doubtless there are one or more entrances by way of the back premises.'

The baronet nodded assent.

'Such being the case, would there, in your opinion, sir, be any insuperable difficulty, supposing a person to be wishful of so doing, more especially if he happened to have a ready-made acquaintance with the run of the house, in stealing into it unobserved, hiding in one of the unused rooms, watching his opportunity, and the moment the girl's back was turned, making his way into the nursery, flinging (let us assume) a cloth over the child's head so as to smother its cries, opening the window, dropping from the balcony to the ground—the height, even when burdened with the child, would be a trifle to an active man—and then, aided by the dusk, making off through the shrubbery, it may be to some rendezvous previously agreed on with his accomplices, supposing him to have had any: would there be anything out of the range of probability in all this?'

Sir Harry gasped a little. Dimwade's way of stating his supposititious case was such that the baronet seemed to see the whole affair pass like a panorama before his eyes. 'As you state the case, there seems to me nothing whatever out of the range of probability,' he murmured. 'Indeed, quite the contrary, were it not for one thing: what possible motive could any one have for acting as you have suggested?'

Dimwade showed his teeth. 'Motives are very queer things, sir, and very hard to get at. Just now, I am concerned more with the method than the motives of the abduction; but we shall probably have to consider that part of the question later on.' Then, a moment later: 'By the way, have the unused bedrooms been searched for any traces of a possible intruder?'

'Not so far as I am aware,' answered Yardley.

'Suppose we throw an eye over them, now we are on the spot,' suggested Dimwade.

Accordingly, not one eye, but six were brought to bear on the rooms in question, but without being productive of the slightest result.

'Now, as to the ground below the balcony,' said the detective; 'has it been examined for traces of footsteps, or any other marks which would tend to prove it was by that way the child was carried off?'

'That was a point which I did not overlook,' replied the superintendent; 'but I thought it best to leave the examination till we could have daylight to help us.'

'Quite right. Suppose we go and examine the ground at once.'

'Yes,' said Inspector Dimwade a few minutes later, 'these are undoubtedly heel-marks, and the assumption is that they were made by the rascal when he let himself drop from the balcony with the child in his arms.'

He had gone down on one knee, and was examining certain dints in the gravelled drive which would hardly have been discernible had they not been sought for by the aid of a small but powerful magnifying glass.

'Now, if this surface,' he went on, 'instead of being hard gravel, had been turf or garden mould, it might possibly have furnished us with an important link in the chain of evidence; that is to say, we might not improbably have been able to find a pair of boots or shoes which would have exactly fitted the impressions. As it is, however, I am afraid the marks will prove of no service to us, for, although they are palpably here, yet they are little more than surface scratches, and might have been caused by one pair of boots just as readily as by another.' He rose and put away his glass. 'From this point, I presume, the fellow would have little or no difficulty in making his way out of the park?'

'None whatever,' answered the baronet. 'There is a public right-of-way across the lower end of the park which is open night and day to anybody who may choose to make use of it.'

WILD CATTLE.

THERE was a time in the annals of Britain when the greater part of the country was covered with forests, wild, sombre, and impenetrable, which gave shelter and sustenance to such *feræ nature* as the bear, the boar, the wolf, and the wild cattle of which we propose to speak here. One of these forests extended with hardly a gap as far as the English Apennines extend—that is, from Staffordshire to the Cheviots; and spread out on either side of the 'backbone' of England over the greater portion of what is now North Derbyshire, Lancashire, and Yorkshire, Cumberland, Westmorland, and Northumberland, to the debatable ground of the Border, where the Caledonian Forest began, and stretched northwards for eighty miles more. Towards the south much the same state of things existed, though the forests there were not so thick or extensive as those farther north; and man's footsteps were confined for the most part to the seacoast, from which ultimately the path of civilisation and the collateral path of devastation widened as fresh conquerors came in and drove their predecessors inland.

Here and there a town appeared in the interior, in some place fitted by nature or formed by man under the exigences of circumstance; a rough road was made thither, and for a radius of a few miles round there might be a clearing. But beyond this radius the primeval forest raised its forbidding front again, and man stopped short, save when he made excursions a little way in, to procure for himself and his household a change of meat. This state of things existed not only in prehistoric, but in some places down to comparatively late historic times. When Matthew Paris was alive, thick woods extended from the edge of Ciltria (Chiltern) over places which are now populous and respectable London suburbs, nearly up to the very city itself, and were inhabited by 'numerous and various beasts, wolves, bears, forest bulls, and stags.'

It was especially so in the midland and northern parts, and it is in these parts that we find the latest and most frequent trace of the presence of wild animals—boars, wolves, and cattle. The region was not opened up and cultivated until some centuries later than the south; hence hearsay mention of the different species by temeritous and fortuitous travellers, and authentic mention of them in the late records of families situated in the midst of and owning the peculiar haunts of the creatures. But in time, the north underwent the same process of cultivation as had transformed the other part of the country from a sombre and sublime to a smiling and beautiful landscape. Forests were cut down without scruple, and at most only a few hundred acres out of many miles' extent were fenced around for the preservation of deer and cattle; wolves and boars having by this time become an unmitigated and dangerous nuisance, and having man's hand unanimously raised against them in consequence.

Deer still flourish because they are, or are regarded as being, very valuable. But the wild white cattle are slowly but surely following the other forest-rangers, the process of extermination in their case being aided by interbreeding, by the ravages of the foot-and-mouth disease, by accidental poisoning, and by the ferocity of the animals themselves. At the present day there are only four or five parks in all Britain where they are to be seen; and it will afford some idea of the rate at which they are dying out when it is stated that during this century alone, Gisburne Park in Yorkshire, Middleton Park and Whalley Abbey in Lancashire, Wollaton Park in Nottinghamshire, Leigh Court in Somersetshire, and perhaps half-a-dozen Scottish estates, have become depopulated of them.

Wild cattle are distinguished from our ordinary domestic breeds as well by the fact that they are wild as by the additional fact that they are pure white in colour, with the extremities—the tips of the horns, the feet, and the ears—either black or reddish brown. Much learned and ingenious—though somewhat superfluous—speculation has been offered to solve the mystery of their origin, and their presence in an alien land amid alien surroundings. Did the Romans import them? Manifestly not, for Cæsar was a Roman, and he expresses surprise at the great size of the *uri* he met with. As a rule, settlers in a new country, provided that country be not very remote,

carry some of their own sheep and cattle with them; and it has been asserted that one or other of the early bands of rovers who touched and settled upon our eastern shores imported the wild white cattle. But against this it is to be objected that their herds must of necessity have been tame; and the assumption that they did import the white oxen is only useful as serving to explain the origin in this country of certain domesticated varieties known to have existed, but now merged in other and differently-coloured varieties.

There is another and even more radical objection. Rüttimeyer has shown—and has been followed by Darwin, Lyell, Boyd Dawkins, and others—that the so-called *uri* are descended from the gigantic *Bos primigenius*, one of the four species to which all our European varieties owe their existence; and the bones of this animal have been found in our country dating from the Palæolithic age. So that if any bold adventurers did carry them across from the Continent, it must have been at a very remote period indeed.

Other descendants of the same large animal are found in many parts of Europe nowadays, notably in Hungary and on the Russian steppes; yet others are known to have existed in Friesland, Holstein, and elsewhere; and the most reasonable supposition seems to us to be that the urus—which was once very plentiful—spread all over Europe at the time when there was no such thing as a German Ocean, and when Britain was part of the Continent. Darwin said it was extremely doubtful whether he was white, and based his conclusion upon the tendency there is among wild or escaped cattle to become white with coloured ears, and upon the occasional appearance of dark-coloured calves among the existing or recently extirpated British herds. But may not this last fact be accounted for on the supposition of a cross? And was not the parental stock absolutely wild? The majority of scientists have adopted the conclusion which seemed to Darwin to be 'extremely doubtful,' but the question is hardly worth pursuing in the present connection. As for the undoubted deterioration in size, that may be attributed to a variety of causes, among others, to less favourable conditions of life and to the close interbreeding of which mention has been made.

The decrease may in the course of the centuries have been prodigious; but the wild cattle of Chillingham Park, in Northumberland, are magnificent creatures nevertheless—so magnificent in all points, that few of our domestic breeds can be said to rival them. The park, extending over eleven hundred acres, is of very ancient enclosure. Mention is made of the 'grete woode' of Chillingham in a document dating from the year 1220; and it is certain that in this century at the latest, the original extent of fifteen hundred acres was emparked, and the cattle driven in, as at Cadzow Castle in Lanarkshire, Naworth on the Border, and Drumlanrig in Dumfriesshire, from the circumjacent Caledonian Forest.

They present all the characteristics of animals found in a state of nature, save in being more delicate and slight in the bone than the latter—a result due to the causes which have affected the creatures' size. They are splendidly shaped—short in the leg, straight in the back and belly

lines, with thin skin, and with horns elegantly curved and of very fine texture. They have a peculiar cry—'more like that of a wild beast than that of ordinary cattle,' said the late Lord Tankerville, their owner; and they hide their young, feed at night, and bask or sleep during the day.

They are timorous and at the same time pugnacious—that is to say, they will usually move off at the sight of any one even at a distance; but will sometimes become aggressive, especially if there is a menacing look in the stranger's eye. And if attacked, they will turn and become dangerous assailants. This is in summer, when their blood is hot; in winter, when it is cooler, and when food is scarce in the upper park, they are more tractable and tame. At this season they 'will let you come among them, particularly if on horseback.' When migrating to the lower park at certain intervals, they move in single file, the bulls leading. When returning, they move in the same manner, like a regiment of cavalry; but in this instance the bulls bring up the rear. If seized with a sudden panic, they gallop off pell-mell, but have a peculiar faculty, observable in red-deer also, of taking advantage of the irregularities of the ground, by which means they may traverse the park and yet hardly give you a sight of them.

'No sight could be more beautiful than they were when we saw them retreating in regular order into their forest sanctuary,' says Mr Hindmarsh, in his exhaustive account of them contained in the second volume of the *Annals of Natural History*. 'Their perfect symmetry, pure white colour, and fine crescent horns, render them when moving in a body a very imposing object. The eyes, eyelashes, [hoofs], and tips of the horns alone are black; the muzzle is brown, the inside of the ears red or brown, and all the rest of the animal white. Even the bulls have no manes, but only a little coarse hair upon the neck; and they fight for supremacy until a few of the most powerful subdue the others, who submit to the rule of superior physical strength. If by accident a bull gets separated from the herd for a day or two, his settled relation seems to be forgotten, for on his rejoining it, a fight ensues, and the conflict continues until the previous amicable understanding is re-established. The cows generally commence breeding at three, and continue to breed for a few years. When they calve, they hide their young for a week or ten days, and repair to the place of concealment two or three times a day for the purpose of suckling them. Should any person happen to approach their hiding-place, the calves clap their heads close to the ground and lie in form like a hare. They bear the winter well. They are seldom allowed to live more than eight or nine years, at which period they begin to go back. When slaughtered, the steers are usually six years old, and weigh about five hundred-weight, or forty stone.' The clean carcase of one bull, however, shot in 1826 by Earl Clanwilliam, weighed fifty-six stone; and the meat is always excellent—far more tender and juicy than that of the common cow. When Mr Hindmarsh paid his visit to the park the herd numbered eighty, of which forty were cows, twenty-five bulls, and fifteen steers of various ages. In

1861 they had dwindled down to about fifty; but increased by October 1874 to seventy-one. Six years later there were fifty-nine only, and at the present time the total is sixty-nine.

The Lyme Park herd, which has very recently become exterminated, differed from that of Chillingham in some important respects. They were larger—they were, in fact, the largest breed of cattle in the country; the coloured parts, with the exception of the hoofs, were generally red, though sometimes they were found approximating to blue-black or coal-black; and they were very hairy, having curly and luxuriant mane-like locks on the head and forequarters. Their hide, again, was of immense thickness; and they had much flesh about the neck and dewlap. They were very long in the body, high in the leg, and strong of bone, and possessed of 'a peculiar majestic stateliness,' as Mr Harting puts it. The park is situated in Cheshire, seven miles north of Macclesfield, and was at one time comprised within the forest of this name, whence the cattle were doubtless driven in when Richard II. granted the estate to Sir Piers Legh for his services at Cressy.

An attempt was made some years ago to reinvigorate the type by crossing it with the Gisburne cattle, but without conspicuous success. The late Rev. John Storer, in his *Wild White Cattle of Great Britain*, says 'the horns are of an intermediate character between those of the Chillingham and Chartley breeds—larger, not so upright, nor so nearly resembling in their mode of growth the horns of the Devon or Welsh breeds as is the case with the Chillinghams, but smoother, somewhat more upright in their growth, and less like the horns of the old Longhorns than is the case with the Chartley cattle.' In habits they were similar to the herd already described. They were timid, but dangerous if assailed. The cows were especially ferocious, and it is said that the poachers took uncommon care not to run into them.

The Chartley herd is not so wild. The park in Staffordshire where they are confined—and which once formed part of the Forest of Needwood—abuts on one side on to a public road, from which only a pale fence separates it; and in this way the cattle have become habituated to the sight of man. They are white, with black muzzles and hoofs, and a suggestion of black also upon the front part of the fetlock of all four legs. In some of them, black blotches appear on the neck, and occasionally a calf wholly black is born, and forthwith destroyed, because the circumstance is supposed to be an augury of ill for the house of Ferrers; or because it is desired to keep the breed as pure and uniform as possible.

The pasture upon which they feed is not good; it is wild and open, with little timber, and scanty and inferior herbage; yet the cattle thrive and look marvellously well. They also are very straight in the back and belly lines, deep in the body, and short in the leg. The hindquarters are slighter than the fore, as is the case with all wild animals, but are of considerable strength, nevertheless; and 'the flesh is carried well downwards towards the hock.' The head is 'elegant in the cow, masculine in the bull, "kind" in the steer,' with a topknot of long white hair, and is set off by extending, slight, and gracefully-

curved horns; the lock of hair, which gives the creature a demure expression, being a peculiarity held in common between this and the Somerford Park herd. The last named, located in Cheshire, a few miles from Congleton, are domesticated and harmless, but are not pure white. The possessor does not encourage this colour; the breed shows a strong tendency to produce small black spots on the neck, sides, and legs—to become speckled, in fact.

Where they came from and how they became domesticated are matters concerning which nothing is known. Sir Charles Shakerley in response to inquiries, said: 'We have no history of how they came or how long they have been here. I am of the third generation which has known nothing about them. The tradition is that they have been here two hundred years'—which is all very unsatisfactory, as a resolution of the matter would be interesting. Possibly they—or rather their ancestors—roamed wild in the forests, and they have become tame after having intercourse with man. Or possibly, again, they have been derived from some ancient monastery, of which at one time there were plenty in the neighbourhood, and where they could come under the refining and humanising influence of the monks.

Mr Harting's suggestion, which is worthy of consideration, is that, as they are of the same race as those at Middleton Park, in Lancashire, they may have come originally from Shakerley, only a few miles distant from Middleton and Blakeley.

The Scottish herds still in existence are two, and are preserved at Kilmory House, Argyllshire, and Hamilton or Cadzow Castle, Lanarkshire. The first is semi-wild, in colour white with black points, and having the ears, muzzles, and hoofs black. They are descended from the cattle which flourished over fifty years ago at Blair Athole, Perthshire, and which were sold to the Marquis of Breadalbane and to the Duke of Buccleuch. The Hamilton herd has peopled Cadzow Park from time immemorial. Robert Bruce hunted the wild bull here in 1320; and several succeeding—and who knows how many preceding—kings enjoyed the same pastime. The animals are not white, like the Chillingham beasts, with which they may be supposed to have most in common, but are rather dun white, with the muzzle, hoofs, and the inside of the ear black, and the forepart of the leg from the knee downwards mottled with black.

Sir Walter Scott has celebrated them in his ballad of *Cadzow Castle*:

Mightiest of all the beasts of chase
That roam in woody Caledon,
Crashing the forest in his race,
The mountain bull comes thundering on.

Fierce on the hunter's quivered hand
He rolls his eye of swarthy glow,
Spurns with black hoof and horn the sand,
And tosses high his mane of snow.

An excellent fanciful description, and quite worthy of the wizard who penned it. Only it happens that the Cadzow cattle have not got manes; their hair is short and curly. Scott falls into another error when he says they were exterminated for their ferocity about the year 1769; for

they still survive, and increase and multiply more rapidly and more surely than any other variety in the kingdom. They are so healthy perhaps because they have been crossed with good breeds in Cromwell's day and still more recently. Probably the Chillingham herd has also been crossed, although such a suggestion is scouted by the owner, whose boast it is that his cattle have been preserved pure ever since their enclosure. But most of the herds which have died out have gone that road because continuous interbreeding made them infertile, and the Northumbrian herd would doubtless have followed suit but for such an unrecorded admixture of other blood as has been supposed. In point of fact, and in conclusion, it is only by crossing that any of the few herds now remaining can continue to flourish; and even then, they are bound to lose their individual characteristics; so that the race—as wild cattle preserving the traditions of the *Bos primigenius*—must inevitably disappear at no very distant time.

A MARRIAGE MADE IN HEAVEN.

IN TWO CHAPTERS—CHAP. I.

In the backwoods of Canada, about eighty miles north of Lake Ontario, there is a chain of three lakes, linked by the stream of a rapid river, which leads southward from the heart of a great forest. The last of the three lakes is broad and has but a slow current, because of a huge dam which the early Scottish settlers built across its mouth in order to form a basin to receive the lumber floated down from the lakes above. Hence this last lake is called Haven, which is also the name of the settlement at the side of the dam; for the worthy Scotsmen, having set up a large sawmill, built a church beside it, and by degrees a town and a school-house. All the wealth of the town comes from the forest; and the half-breed Indian lumber-men, toiling anxiously to bring their huge tree-trunks through the twisting rapids, connect all pleasant thoughts in their minds with the peaceful Haven Lake and the little town where they receive their wages. They are simple men for the most part; and, perhaps because they have received their first ideas of civilised religion and of the comforts of a good harbour at the same place, their tripping tongues to this day call it, not 'Haven,' but 'Heaven.'

As for the town, it thrrove apace in its early days, and there was no one in it who thrrove better than Mr Reid, who kept the general shop. He was a cheerful soul; and it was perhaps owing more to his wife's efforts than his own that his fortune was made, for she kept more closely to the shop and had a sharper eye for the pence.

Mrs Reid was not cheerful; she was rather of an acrid disposition; and people said that there was only one subject on which the shop-keeper and his wife agreed, and that was as to the superiority of their daughter in beauty, talent, and amiability, over all other young women far or near. In their broad Scotch

fashion they called this daughter Eelen, and the town knew her as 'Bonnie Eelen Reid;' for every one acknowledged her charms, although there might be some who would not acknowledge her pre-eminence.

Mr and Mrs Reid carried their pride in their daughter to a great extent, for they actually sent her to boarding-school in the town of Coburgh, which was quite two days' journey to the south. When she finally came back from this educating process well grown, healthy, handsome, and, in their eyes, highly accomplished, the parents felt that there was no rank in the Canadian world beyond their daughter's reach, if it should be her pleasure to attain it.

'It wouldn't be anything out of the way even,' chuckled the happy Mr Reid, 'if our Eelen should marry the Governor-general.'

'Tuts, father, Governors!' said his wife scornfully, not because she had any inherent objection to Governors as sons-in-law in a general way, but because she usually cried down what other people said.

'The chief difficulty would be that they are usually married before they come to this country—aren't they, father?' said Eelen with a twinkling smile.

She did not choose to explain to any one what she really thought; she had fancies for her own, this pretty backwoods maiden.

'Well, well, there are lads enough in town, and I'll warrant she'll pick and choose,' said the jolly father in a resigned tone. He was not particular as to a Governor, after all.

That conversation happened when Eelen first came home; but a year or two after, the family conferences took a more serious tone. She had learnt to keep her father's books in the shop, and had become deft at housework; but there was no prospect of her settling in a house of her own, for many of the best young men in the place had offered themselves as lovers and been refused.

'Oh! what's the use o' talking, father,' cried Mrs Reid; 'if the girl won't, she won't, and that's all.—But I can tell *you*, Eelen Reid, that all your looks and your manners won't save you from being an old maid, if you turn your back on the men.'

'I wasn't talking,' said Mr Reid humbly; 'I was only saying to the lassie that I didn't want her to hurry; but I'd be right sorry when I'm getting old not to have some notion where I was going to leave my money—it'll more than last out Eelen's day, if it's rightly taken care of.'

'But I can't marry unless I should fall in love, father dear,' said Eelen wistfully.

Life was by no means dull in the little town. There were picnics in summer; sleigh-drives in winter, balls, and what not; and Eelen was no recluse. Still, she loved the place better than the people, and there was not a spot of ground in the neighbourhood that she did not know by heart.

In summer, the sparkling water of the lake rippled under a burning sun, and the thousand tree-stems left floating in it, held near to the edge of the floating boom of logs, became hot and dry on the upper side, while the green water-moss caught them from beneath. It was great

fun for the school children to scamper out daringly on these floating fields of lumber; and Eelen liked to go with them, and sometimes walk far out alone along the edge of the boom. She would listen to the birds singing, the children shouting, to the whir of the saws in the mill, and the plash of the river falling over the dam; and she would feel that it was enough delight simply to live without distressing herself about marriage yet awhile.

When winter came, Eelen was happier still. All the roughness and darkness of the earth was lost in a downy ocean of snow. Where the waterfall had been, there was a fairy palace of icicles glancing in the sun, and smooth white roads were made across the frozen lake. Eelen never drew back dazzled from the glittering landscape: she was a child of the winter, and she loved its light. She would often harness her father's horse to the old family sleigh and drive alone across the lake. She took her snowshoes with her, and, leaving the horse at some friendly farmhouse, she would tramp into the woods over the trackless snow. The girl would stand still and look up at the solemn pines and listen, awed by their majestic movement and the desolate loveliness all around. At such times, if the thought of marriage came, she did not put it aside with the light fancy that she wished still to remain free; she longed, in the drear solitude, for some one to sympathise with her, some one who could explain the meaning of the wordless thoughts that welled up within her, the vague response of her heart to the mystery of external beauty. Alas, among all her suitors there was not such a friend.

There was no one else in the town who cared for country walks as Eelen did—at least, no one but the schoolmaster. She met him occasionally, walking far from home; he was a quaint, old-looking man, and she thought he had a face like an angel's. She might have wished sometimes to stop and speak to him; but when they met, he always appeared to have his eyes resting on the distant horizon, and his mind seemed wrapped in some holy reverie, to the oblivion of outward things. The schoolmaster lived in the school-house on the bank of the curving river, a bit below the waterfall. He took up his abode there a few months before Eelen Reid came home from school. He had come from somewhere nearer the centres of education—had been imported, so to speak, for the special use of Haven Settlement, for the leading men of the place were a canny set and knew the worth of books. His testimonials had told of a higher standard of scholarship than was usual in such schools, and the keen Scots had snapped at the chance and engaged him without an interview; but when he arrived, they had been grievously disappointed. He was a gentle, unsophisticated man, shy as a girl, and absent-minded withal.

'Aweel, I'll not say but he'll do to put sums and writing into the youngsters' heads and teach them to spout their poems; but he's not just what I call a *man*.' This was the opinion which Macpherson, the portly owner of the mill, had delivered to his friends.

'There's something lacking, I'm thinking,' said one; 'he's thirty-six years old, and to see him

driving his cow afield, you'd say he was sixty, and him not sickly either.'

'I doubt he's getting far too high a salary,' said Macpherson solemnly. 'To pass examinations is all very well; but he's not got the grit in him that I'd like to see.'

So they had called a school committee meeting, and suggested to the new schoolmaster, as delicately as they could, that they were much disappointed with his general manner and appearance, but that, as he had come so far, they were graciously willing to keep him if he would consent to take a lower salary than that first agreed on. At this the schoolmaster grew very red, and, with much stammering, he managed to make a speech. He said that he liked the wildness and extreme beauty of the country, and the children appeared to him attractive; he by no means wished to go away; and as to salary, he would take what they thought him worth.

In this way they closed the bargain with him on terms quite satisfactory to themselves.

'But hoots,' said the stout Macpherson as he ambled home from the meeting, 'I've only half a respect for a man that can't stand up for himself,' and this sentiment was more or less echoed by them all.

Happily, the schoolmaster did not desire society. The minister's wife asked him to tea occasionally; and he confided to her that, up to that time, he had always lived with his mother, and that it was because of her death that he had left his old home, where sad memories were too great a strain upon him, and come farther west. No one else took much notice of him, partly because he took no notice of them. At the ladies' sewing meeting the doctor's wife looked round the room with an injured air and asked: 'How is it possible to ask a gentleman to tea when you know that he'll meet you in the street next morning and won't remember who you are?'

'A lady who respected herself couldn't do it,' replied Mrs Reid positively, and then in an undertone she remarked to herself, 'The gaby.'

Miss Ann Blakely pursed her lips and craned her thin neck over her work. 'As to that I don't know, Mrs Reid; no one could visit the school, as I have done, and fail to observe that the youth of the town are more obedient than ever formerly. In my opinion, a gentleman who can command the respect of the growing masculine mind'—She finished the sentence only by an expressive wave of her head.

'There is much truth in Miss Blakely's remark,' said a timid little mother of six sons.

People married early, as a general thing, in Haven Settlement, and Miss Blakely, having been accidentally overlooked, had, before he came, indulged in some soft imaginations of her own with regard to the new schoolmaster, and, like others, she was disappointed in him; but she had not yet decided 'whether,' to use her own phrase, 'he would not, after all, be better than none.' She poised this question in her mind with a nice balancing of reasons for and against for about three years, and the man who was thus the object of her interest continued to live peacefully, ignorant alike of hostile criticism and tender speculation.

It was a terrible day for the schoolmaster when the honest widow who lived with him as house-

keeper was called away by the death of a daughter-in-law to go and keep house for her son in another town. She could only tell him of her intention two weeks before it was necessary to leave; and very earnestly did he consult with her in the interval as to what he could possibly do to supply her place, for servants in Haven Settlement were rare luxuries.

'I don't know, I'm sure, sir, what you can do,' said this Mrs Sims hopelessly. 'The girls in these parts are far too proud to be hired to work in a house. Why, the best folks in town mostly does their own work; there's Mrs Reid, so rich, just has a woman to do the charing; and Eelen—that's the beauty, you know—makes the pies and keeps the house spick-and-span. But you couldn't keep your own house clean, could you, sir?—let alone the meals, and you wouldn't live long if you hadn't them.'

As the days wore on, the schoolmaster became anxious and more urgent in his appeals for advice; but he did not get encouragement to expect to find a servant of any sort, for the widow was too sincere to suggest hope when she felt none, and the difficulty was not an easy one to solve. She made various inquiries among her friends. It was suggested that the master should go to 'the boarding-house,' which was a large barn-like structure, in which business men who did not happen to have families slept in uncomfortable rooms and dined at a noisy table. Mrs Sims reported this suggestion faithfully and added: 'But it's my belief it would kill you outright.'

The schoolmaster looked at his books and the trim arrangements of his neat house, and negatived the proposition with more decision than he had ever shown before.

After a while, Mrs Sims received another idea of quite a different nature; but she did not report this so hastily—it required more finesse. It was entrusted to her care with many injunctions to be 'tactful,' and it was suggested that if there was a mess made of it, it would be her fault. The idea was nothing less than that it would be necessary for the master to marry; and it was the gaunt Miss Ann Blakely herself who confided to his present housekeeper that she should have no objections to become his bride, provided he wrote her a pretty enough, humble sort of letter that she could show to her friends.

'For, mind you, I'd not go cheap to the like of him,' she said, raising an admonishing finger, as she took leave of her friend; 'I'd rather remain single, far.'

'I think he could write the letter,' replied Mrs Sims; 'leastways, if he can't do that, I don't know what he can do, poor man.'

Having been solemnly enjoined to be careful, Mrs Sims thought so long over what she was to say before she said it, that she made herself quite nervous, and when she began, she forgot the half. Over her sewing in the sitting-room one evening she commenced the subject with a flustered little run of words. 'I'm sure such an amiable man as you are, sir, almost three years I've been in this house and never had a word from you, not one word'—it is to be remarked that the widow was speaking of fault-finding, and did not by any means intend to assert that the schoolmaster had been mute—

'and you are nice in all your ways, too; if I do say it, quite the gentleman.'

'Oh!' said the schoolmaster, in a tone of surprise, not because he had heard what she said, but because he was surprised that she should begin to talk to him when he was correcting his books.

'And not a servant to be had far or near,' she went on with agitated volubility; 'and as for another like myself, of course that's too much to be hoped for.' She did not say this out of conceit, but merely as representing the actual state of affairs.

The schoolmaster began to look frightened. He was not a matter-of-fact person, but, as long as a man is a man, the prospect of being left altogether without his meals must be appalling.

'So, why you shouldn't get married, I don't know,' she added in tremulous excitement, speaking in an argumentative way, as if she had led him by an ordered process of thought to an inevitable conclusion.

'Oh!' exclaimed the schoolmaster in surprise again, this time because he *had* heard what was said.

The worst was over now; and Mrs Sims, having once suggested the desperate idea of the necessity of marriage, could proceed more calmly. She found, however, that she had to explain the notion at length before he could at all grasp it, and then she was obliged to urge its necessity for some time before he was willing to consider it. He became agitated in his turn, and, rising, walked up and down the room, his arms folded and an absent look in his eyes, as though he were thinking of things further off.

'I do not mind telling you, for I believe you are a motherly woman, Mrs Sims, that it is not the first time that the thought of marriage has crossed my mind' (with solemn hesitation). 'I have thought of it before; but I have always been hindered from giving it serious consideration from the belief that no woman would be willing to—ah—to marry me.'

'Well, of course there's some truth in that, sir,' said his faithful friend, reluctantly obliged by her conscience to say what she honestly thought.

'Just so, Mrs Sims,' said the schoolmaster with a patient sigh; 'and therefore, perhaps it will be unnecessary to discuss the subject further.'

'Still, there's no accounting for tastes; there might be some found that would.'

'It would not be necessary to find more than one,' said he, with a quiet smile. He was not a stupid man, although his intellect did not take a practical turn.

'No, that's true, sir, which makes the matter rather easier. It's always been my belief that while there is life there is hope.'

'True, true,' he replied; and then he indulged in a long fit of musing, which she more than suspected had little to do with the immediate bearing of the subject on his present case. It was necessary to rouse him, for there was no time to be lost.

'Of course I don't say that there's many that would have you; there's girls enough; but laws! they'd all make game of you if you were to go a-courting to them, and I take it

courting's not the sort of thing you're cleverest at.'

'True,' said the schoolmaster again, and again he sighed.

'But now, a good sensible woman, like Miss Blakely, as would keep you and your house clean and tidy, not to speak of cooking—I make bold to say you couldn't do better than to get such a one, if she might be so minded.'

'Who is Miss Blakely?' he asked wonderingly.

'It's her that visits the school so often; you've seen her time and again.'

'I cannot recollect her at all,' he said, after a futile attempt.

'That's just what I said,' she observed triumphantly. 'You'd be no more up to courting than cows are up to running races.—Now, as to Miss Blakely, not being as young as some, nor to say good-looking, she might not stand on the ceremony of much courting, if you just wrote her one letter, asking her quite modest and putting in a few remarks about flowers and that sort of thing, as you could do so well, being clever at writing, I give it as my opinion it's not unlikely she'd take you out of hand; not every one would, of course, but she has a kind heart, has Miss Blakely.'

'Kind is she?' said he, with a tone of interest; 'and sweet-tempered?'

'Well, as to her temper, I'll not just say; but maybe she's no worse in that respect than myself, and you and I have never had words. I've no doubt that she'd be all that you wish, sir, for the reason that you'd never give her occasion to be otherwise.'

She said much more in favour of the scheme; it required that she should say much, for the schoolmaster was not to be easily persuaded. She had, however, three strong arguments in its favour, which she reiterated again and again, with more and more assurance of certitude as she warmed to the subject. The first point was, that if he did not marry, he must either starve at home or go to the boarding-house, and at the latter place she assured him again, as she had done at first, he would probably soon die. Her second point was, that no one else would be willing to marry him except Miss Blakely; and her third, although in this matter she expressed herself with some mysterious caution—that Miss Blakely would marry him if asked. Mrs Sims bridled her head, spoke in lower tones than was her wont, and said that she had the secret of Miss Blakely's partiality from good authority. She sighed; and he heard her murmur over her sewing that the heart was always young. In fact, without saying it in so many words, she gave her listener to understand clearly that, although he could not at all recollect Miss Blakely, Miss Blakely had conceived a very lively affection for him. And this last, if she had but known it, had a stronger power of persuasion than either the prospect of starvation or a lingering death in the rude noise of a boarding-house; for the schoolmaster was tender-hearted, and, moreover, he had a beautiful soul, and supposed all women to be like his mother, whom he had loved with all his strength, and whose loss he still passionately deplored. However, Mrs Sims could gain nothing

from him but a promise to think the matter over for the next few days.

'But you'd better make haste, sir,' she said, 'for I must leave on Thursday, and now it's Saturday night. There's not overmuch time for everything—although, indeed, Mrs Graham, that goes out charring, might come in and make you your meals for a week, though it will cost you half a quarter's salary, charring is that expensive in these parts.'

MYOSOTIS.

FAIR Myosotis, where the murmuring river
Winds through the meadows green,
Where mellow grasses by the margins quiver,
Thy sweet face may be seen.

Not where the lances of the sun are gleaming,
But in some shaded spot,
Thou lov'st to pass the summer day in dreaming,
Blue-eyed Forget-me-not.

Round lonely islets, where the current gushes,
Thine eyes, so shy and sweet,
Peep from their canopies of clustering rushes
Into the light and heat.

Thou art the silvan child of Meditation,
The nursling of the streams—
Born of the wanton winds—the fair creation
Of showers and sunny gleams.

Half-hidden, thou droop'st like a fragile maiden;
Thy pale love-pensive eyes
Seem with fond dreams and recollections laden
Of love that never dies.

Thy mission is to waken memories tender
In distant hearts and far,
And thrill again the soul with Love's soft splendour,
Which Time in vain would mar.

Bloom on, fair buds! the brook shall bear thy mission
To city haunts, and make
Fond hearts responsive beat to that unition,
Which absence may not break.

Steadfast alike in sunshine and in shower,
Thine eyes of azure blue;
Emblem art thou of Constancy, sweet flower,
Of all that's fair and true!

GERALD B. GREENE.

* * TO CONTRIBUTORS.

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

WESTMINSTER ABBEY.

M. D'HOLBACH, a French writer in the middle of the eighteenth century, said: 'The people are not more crowded in the streets of London than are the funeral monuments in the Abbey.' About the same time there appeared in the *Annual Register* a mock-petition from posterity on the subject. Since then, the overcrowding has continued in an increasing ratio, until now there is almost no space for further memorials, and room for only a few more interments. As the supply of heroes worthy of this honour will doubtless be maintained, it has become urgently necessary to consider how additional space can be provided. Several schemes have been put forward and evidence concerning them has been submitted to a Royal Commission appointed to deal with the problem. These rival projects for a new *Campo Santo* have been discussed in the daily press, and need not be described here; but the newspapers have overlooked the still more interesting light cast by several of the witnesses upon some historical aspects of the inquiry, the first official Report of which has just been issued.

Dean Bradley, for instance, has been at special pains to add to our knowledge of what is beyond dispute the most interesting church in Great Britain. In order to trace the origin of the peculiar position occupied by the Abbey as the national Walhalla, the worthy Dean devoted much time to original inquiries and to the study of ancient unpublished documents, with results set forth for the first time in his evidence. He reminds us that, although time-honoured, the word Abbey is, strictly speaking, an inaccurate designation of the sacred building. Since the second year of the reign of Elizabeth, its legal name has been, 'the Collegiate Church of St Peter in Westminster.' The popular and more familiar name, which has survived all historical vicissitudes, carries us back to its very early history, being, in fact, the short form of the fuller phrase, Westminster Abbey Church—that is, Church of the Abbey of Westminster. It

had a twofold character—namely, that of royal chapel attached to the neighbouring palace, and church of an ancient Benedictine monastery. Edward the Confessor's purpose in building it was that it might serve as his own burial-place, just as any other great man in these remote times might found and endow a priory or abbey for the saying of masses for his soul. Near the grave of the saintly king, William the Conqueror was crowned; and there, as our readers know, every successive monarch who has reigned in England from that day to this has received the rite of coronation. Two royal ladies—the wife of the Confessor, and his kinswoman, who became the wife of Henry I.—were buried near him; but there is no historical record of any other interment within the Abbey in the earliest stage of its history. Even the abbots were buried outside in the cloisters. The fame of the church had greatly grown, when Henry III., actuated by the same motives as the canonised Edward, rebuilt the church, or at least its most important portions. His own tomb was placed on the north of, and as near as possible to, that of the Confessor, whose body was removed to a shrine in the most sacred spot eastward of the altar. The kings who followed were laid there around him in the chapel of Edward the Confessor. The interment of others than sovereigns within the sacred precincts formed no part of the design of the royal founders; neither of them had any idea of erecting a place for the burial of other great men. Richard II. was the first to bury his own ministers and friends in the most venerated portions of the church; and his example was followed by later kings.

Long before the period of the Reformation, the church was not only a royal burying-place and the scene of every coronation, but also became the place appointed for royal weddings and christenings, Te Deums for victories, and national pageants. It was not until the reigns of Henry VIII. and of Edward VI. that a marked increase took place in the number of non-royal interments. In the reign of Elizabeth, there

was a great development in this respect, and the chapels round the east end of the church were no longer used as places of worship, but became simply receptacles of tombs and monuments. Effigies of the illustrious dead rapidly multiplied, and mural tablets also began to appear. But though the stream was widened, the burials were almost entirely those of families who were either connected with royalty by relationship or had prominently served the sovereign in the council chamber, at court, or in the administration of the law.

The Reformation brought about an enormous change; but for some generations the honour of interment in the Abbey had been confined mainly to great statesmen, lawyers, soldiers, and their families. Soon there came the dawn of other claims to that distinction. It is true that the year 1400 had been marked by the burial of Chaucer in the Abbey; but, singularly enough, this was not in recognition of his claim as a poet. It was due rather to the positions he held under Richard II., amongst others that of 'clerk of the royal works;' to his residence at the time of his death in close contiguity to the old church; and not least to his connection through his wife, Philippa, with the Lancastrian line. Edmund Spenser, in 1599, was the first poet to whom the crowning honour of interment in the Abbey was conceded as an express tribute to his poetic fame. Like Chaucer, he died near the church, and the Earl of Essex undertook to pay the expenses of his funeral. The commencement of the civil war marked a new period in the history of the Abbey. It was henceforth more distinctly and consciously recognised as a place of burial or commemoration, an exceptional honour which might be attained by distinguished merit. Both the Protector and Parliament were imbued with what may be called the more modern sense of the value of such commemoration.

According to the late Dean Stanley, the first notice of a burial in the Abbey as an incentive to heroic achievement was the removal of Blake's body from Plymouth Sound. Clarendon records that this was done 'to encourage his officers to venture their lives.' But Blake's body, like those of some other ejected heroes, was afterwards exhumed and buried in a pit dug in the green on the north side of the Abbey. Two of the illegitimate children of Charles II. were buried in the very spot which had held Cromwell. When the burial of eminent soldiers and sailors in the Abbey at the public expense became comparatively common, there was great neglect of economy as to space; there was also a sad lack of what we should call artistic beauty, many of the structures being huge, lofty, and wanting in taste. Although there are now in the Abbey monuments to many famous statesmen, lawyers, warriors, sailors, poets, writers, men of science, physicians, divines, philosophers, engineers, architects, travellers, and even foreigners, it is rather strange that there is only one memorial of a great painter, the cenotaph of Sir Godfrey Kneller.

In early times the initiative for allowing burials in the Abbey rested exclusively with the reigning sovereign. In later generations it has also been occasionally exercised by Parliament; but the responsibility rests with the Dean of

Westminster, in whom, with the Chapter, the care of the Abbey is vested. In reply to a question asked by one of the Royal Commissioners, Dean Bradley reveals the fact that there was something approaching a difference between his predecessor and Parliament over the proposed interment of the late Prince Imperial of France in the Abbey. It was suggested by a Committee of noblemen and gentlemen to Dean Stanley, who was favourably impressed with the idea. He fixed upon what he thought would be the right place for the tomb; but the proposal excited strong opposition. An enormous number of letters was received, some of them threatening dynamite. The late Dean, after consulting the French ambassador, came to the conclusion that the hostile feeling was superficial. He thought it was confined to a certain class both in France and England; so he said: 'If a resolution is passed in the House of Commons against the proposal, I should consider myself bound by that; but nothing short of such an embodiment of the national feeling would prevent me carrying it out.' A resolution was passed in the House of Commons against the proposal.

All the money paid for opening graves or erecting monuments in the Abbey, except a trifling fee to the clerk of works, now goes to the fabric fund, and is devoted to the repair of the edifice. The Dean does not take any step towards the burying of any eminent person in the Abbey until he receives a requisition on the subject; and such requests, which had been too freely conceded in the past, have been sometimes refused in later days. A well-known instance occurred in the case of Lord Byron, whose remains were refused interment in the Abbey. Apart from royal claims, the only remaining prescriptive right of burial in Westminster Abbey belongs to the Percy family. It was by virtue of this ancient and undisputed claim that the late Duchess of Northumberland, who died at Alnwick Castle, was buried so recently as December in St Nicholas's Chapel at Westminster Abbey.

The Commissioners, we may add, have now recommended the enlargement of the Abbey, but they are not agreed as to the precise site for the proposed annexe.

DUMARESQ'S DAUGHTER.

CHAPTER XXXVI.—ONE HOPE IS TOO LIKE
DESPAIR.

WHEN Psyche opened her eyes again, she was lying on her own bed in the little blue-and-green Moorish room, and she knew by the sound of whispered voices that her father and Sirena were leaning tenderly over her. But all around was dark as pitch now: not a ray of light, not a tremor of sense, reached at last those great dim eyes of hers. 'I know, my darling,' Haviland Dumaresq said, with a stifled groan, as she looked up appealingly in the direction of the place whence she heard his voice come towards her. 'I took it up and read it. I understand all. But, my darling, my darling, your sight's come back: you saw it! you read it!'

'It's the last thing I shall ever see on earth,' Psyche answered solemnly—'if it isn't He. My

eyes are gone now. I can make out nothing. Not a sparkle of light. I'm in black darkness.'

It was the first time father or daughter had ever openly alluded to Linnell's existence since the day of that terrible awakening at Petherton. Haviland Dumaresq made no overt answer, but he leant over her with hot tears dropping from his eyes unchecked upon her face, and held her cold white hand intertwined in his with a fatherly pressure.

'Is it He or the other one?' Psyche cried again, unable to hold her suspense and anxiety locked up any longer in her own bosom. 'How can we find out? Oh, how can we find out? Father, do you think it's He or the other one?'

At that piteous cry, Haviland Dumaresq felt his own heart sink horribly within him. 'My darling,' he said, with a fearful shrinking reluctance, 'I can't bear to buoy you up with a false hope: if the paper says anything, it says Sir Austen: "an officer of that name is known to have been missing from Gordon's force after the fall of Khartoum."'

'Yes, yes,' Psyche cried, sitting up on the bed, and groping with her hand for Sirena to support her. 'But that's conjecture—that's pure conjecture.'—Love had taught her logic of its own accord.—'The newspaper knows no more than we do. They can't tell whether it's he or not. The one thing they know is that his name is—that: the French put Sir so often for Mr.'

'Perhaps,' her father answered slowly and sadly, unwilling to quench the smoking flax of Psyche's despondency: 'but we can't tell. We can never guess it. We must wait and see. He'll soon be at Biskra. Only, darling, don't let yourself hope too easily, I implore you.'

Psyche rose, and stood up on the floor. Her face was very white and resolute. No staggering or indecision now. She groped her way like a blind woman to the wardrobe in the corner, and took out her jacket and hat by feeling for them.

'Where are you going, my child?' her father asked in blank surprise.

'To Biskra,' Psyche answered, gazing back at him intently from her sightless orbs. 'To Biskra—to look for him.'

'My darling, my darling, it's quite impossible!'

'Papa,' Psyche said, groping blindly towards the door, 'I must go. I feel I've got to. I can't wait here for all those days in this terror and uncertainty.'

Sirena seized her two hands in hers. 'Psyche,' she cried, with tears falling fast, 'you can't go. You're not half strong enough. It'd kill you to travel all the way to the desert as weak as you are now. But you shan't wait one minute longer than necessary, if we can help it, in this state of suspense. Cyrus and I will go to Biskra right away, and wire news to you, who it is, at the earliest opportunity.'

Psyche shook her head with infinite sadness. 'That won't do,' she murmured. 'I can't stop still. I must do something. I want to be moving. I want to be in action, or else I shall die. And besides, if it's really and truly He, I want to be there on the spot to welcome him.'

Her eyes as she spoke were dry and tearless. The contrast between her words and her impassive

face was terrible to behold. Sirena forced her gently back into an easy-chair. 'Cry, darling,' she exclaimed imploringly. 'Cry, cry, and that'll relieve you. I wanted to have you for my very own sister; but now I'd most give my very life up, if only I could make it be that other man come to take you away from Cyrus. He and I'll go to Biskra right away to find him, and never rest till we've news to tell you.'

As she spoke, with a sudden burst of emotion, the relief of tears came to Psyche. Sirena's sympathy had broken the spell. Her hand had opened the sealed fountain. The poor child flung herself back in the easy-chair and sobbed and moaned like one whose heart is broken. Hoping against hope, she could hardly believe it was really Linnell. She couldn't wait: she couldn't wait. The long delay would almost kill her. And disappointment at its end would kill her inevitably.

They reasoned with her long, but she wouldn't listen.—It was impossible in such a state as hers to go: the journey was long: her nerves were shattered.—But Psyche, a Dumaresq born that she was, remained like adamant. To one thing alone she returned at each assault. She must and would go to Biskra.

At last Haviland Dumaresq, beside himself with remorse, almost gave way. Her earnestness was so great that he dared not refuse her. He consented against his better judgment: 'You may go, then, Psyche.' At that, Psyche rose once more from her chair. As she did so, she staggered and almost fell. She had used up her small remaining strength in the argument. A great horror seemed to come over her all at once. 'I can't,' she cried, flinging her arms up in a passion of despair. 'I'm too weak, too feeble. I can't even stand. Lay me on the bed—Papa—Sirena!'

They lifted her up and laid her on the bed. There she lay long, sobbing low and quietly. It was a relief to her even to be able to sob. After a great pause, she felt about with her pale white fingers for her father's hand. 'Papa,' she murmured once more, 'do you believe in presentiments?'

'Me, my child,' Haviland Dumaresq answered with a start. 'No, no, decidedly. No thought or feeling of any human being is worth anything at all as a matter of evidence, except it be the outcome of direct intimation received by the ordinary channels of sense in touch or sight or smell or hearing.'

'Papa,' Psyche went on, with unnatural calmness, never heeding his disclaimer, 'I think, in certain states of mind, one sees and feels internally somehow. I have a presentiment that it isn't Him. It's the other man, the cousin. And He's really dead. As I tried to rise from my chair that moment a flash came over me. I had a strange sense that I saw him lying dead on the sand—alone and bleeding—away in the desert.'

She said it so solemnly, in the full force of some strange internal conviction pressing itself upon her, as such convictions will at certain times, that for a few seconds nobody spoke. They were overawed by the profound and unearthly certainty of her calm tone. Her sightless eyes were straining into space. She seemed

like one who can penetrate the secrets of space to the remotest distance.

But Haviland Dumaresq, philosopher to the core, knew it was all mere baseless illusion.

After a while she turned her white face towards them again. 'I feel he was murdered,' she said with solemn persistence—'murdered in the sands—by some other white man. Somebody who escaped with him away from Khartoum. Some cruel traitor who killed him, perhaps, to save himself. I see it somehow, clearly, in my own mind. It's borne in upon me now. I can read it like a picture.'

'My child,' her father cried, wringing his hands in his misery, 'don't trust these pictures. They're fancy, fancy. Your brain's overwrought, and it leads you astray. We'll send to Biskra: we'll send and find out all about him.'

'I'll go myself,' Sirena said with a choking voice, swallowing down her sobs. 'I'll go and speak to Cyrus this very minute. We'll set out from Algiers by the first train to-morrow.'

Psyche rose up on the bed where she lay and clutched her arm hard. 'Not you,' she cried, 'Sirena; I can't do without you. Send Corona and Mr Vanrenen, if you will; but *you* must stop. I can't let you go; you're so very dear to me. I want you: I want you.'

Sirena stooped down and kissed her white forehead. 'Thank you, my darling,' she said, profoundly touched. 'If you want me to stop on that account, why, Psyche, I'd give up even the pleasure of going to Biskra to serve you. Though if they *do* find him, I shall just envy them.'

'They won't find him,' Psyche answered with the same unnatural quiet as before in her tone. It frightened Sirena to hear her so calm. She feared such restraint must mean serious mischief in the long run.

'But if they do,' she said, 'they'll be able to tell him all about you, and that'll be so delightful. I just envy them.'

'If they do,' Psyche cried, with something like the old shrinking reserve coming over her with a rush, 'they mustn't tell him anything, not even that I'm here at all. If he's alive, how do I know he even remembers me? All I want is to know he isn't dead. To me, he was, oh! so much, so much. But to him, perhaps, I was never really anything.'

She turned and moaned inarticulately on the bed. Shame and despair divided her soul. Then she felt once more for Sirena's hand. 'And if they don't,' she cried, grasping it convulsively, 'I shall want you here: I shall want you to help me bear the news: I shall want you to hold my head while I die: I shall want you to give me a last, last kiss, next to yours, father.'

The American girl stood and held her own bosom tight to keep it from bursting. Neither of them could answer her a single word. They felt what she said was only too true. They knew in their hearts evil news must kill her.

Sirena tried to disengage her hand. 'Where are you going?' Psyche asked with quick perception of her intended movement.

'To tell Cyrus,' her friend sobbed back.

'Not yet—not yet. Wait with me a little. Do you think he'll go? Do you think he'll do it for me?'

'Why, we'd any of us go to the ends of the earth or cut off our right hands to serve you, dear,' Sirena answered, bursting afresh into tears. 'We feel it's an honour, Psyche, to do anything for you, anyway.'

SEA ANEMONES.

ALTHOUGH naturalists have no difficulty in placing Sea Anemones and their neighbours—popularly known as zoophytes—in the Animal Kingdom, the flower or plant-like appearance is more persistent in this group than in the lower types as exhibited in the Sponges and Protozoa. Biology—the science which treats of living beings—having made great advances in modern times, it need scarcely be said that up till comparatively recent years, sea anemones and zoophytes were judged by their appearance, and even by the most learned, placed in the Plant Kingdom. The beautifully-arranged branching, and the fixed base of the Sertularians or sea-firs, appeal strongly to the untrained eye as having a plant affinity; just as, fully a century ago, the brightly-coloured tentacles of the branching corals satisfied the naturalists of the day that they were dealing with true marine flowers.

In the year 1729, Peyssonnel, a physician of Marseilles, in a paper read before the Academy of Sciences, Paris, ventured to affirm the animal nature of the zoophytes; but, as he expected, the communication was discredited and the light rejected. Twelve years later, Trembley of Geneva approached the question, and brought it to the stage of receiving a fair hearing, and demanding either complete refutation or further confirmation. While the dispute was being carried on by the scientists, the matter was quietly settled by the leisure-time studies of a London merchant named Ellis. This gentleman seemed to have been working away in complete ignorance of the excitement that was raging among the learned doctors and naturalists. This was in 1752; and while some opposition still came from high quarters, the truth gradually gained ground until, with improved apparatus and better methods of observation, the question was by-and-by placed far beyond the bounds of controversy.

Sea anemones differ from zoophytes proper in that they exist as single individuals, instead of in colonies, as obtains in the sea-firs and corals. British sea anemones are found from one-eighth of an inch to seven or eight inches in height, and their diameters vary to nearly the same extent according to the genera to which they belong. They abound in all British waters, and are most frequently found on rocky shores, rock-pools within high-water mark being a somewhat favourite resort on some coasts. The Devonshire coast yields a good many varieties to the diligent searcher; but the Menai Strait and neighbourhood is perhaps the locality where they abound in greatest profusion. In tropical seas, sea anemones attain to three or four times the dimensions of the largest found in British waters. Belonging to the sub-kingdom Cœlenterata (hollow-bodied), sea anemones and their neighbours are placed in the animal scale next above the Sponges. While their distinct digestive cavity is the main feature which distinguishes sea anemones from the still

lower orders, their symmetrical appearance at once enables an observer to place them on a higher level in the scale of life than the shapeless masses which characterise many of the Sponges and Protozoa.

A little column or sack with the mouth turned in upon itself until it approaches the bottom, a crown of tentacles planted on the turned-over part surrounding the opening, and the whole resting on a slightly-widened disc-foot, roughly represents the structure of a typical sea anemone. The opening in the centre is usually oval, as if crushed laterally, and is the mouth of the animal. The space under the mouth formed by the in-turned part of the sack is the digestive cavity or stomach; and the space between this and the outer wall is known as the body cavity. In the latter are a series of radiating vertical plates, which fulfil a function in connection with reproduction, and it is believed also secrete a digestive juice for the use of the stomach. The crown of tentacles is in some species a beautiful creamy white, and in others highly coloured, resembling the corolla of a flower, and have an important function to perform in the capturing of food. The adaptation of means to ends as exhibited in the operations of the tentacles forms a feature of special interest in the physiology of these lowly forms of life.

One of the distinctive attributes of Cœlenterate animals is the possession of what are known as stinging or thread cells. Swimmers who have had the misfortune to collide with a live jelly-fish will know something of the power of these cells. In tropical waters, the *Physalia* or Portuguese man-of-war—a slightly more distant relative of the anemone than the ordinary jelly-fish—has its stinging powers so well developed that it becomes a very serious matter for any one who may get entangled among its long streaming tentacles. The tentacles of the sea anemone are thickly studded with stinging cells, and under a sufficiently high power they are seen to contain very slender threads curled up like miniature hair-springs. Under very slight stimulus these threads are everted with considerable force, the outer end being armed with a barbed or roughened process, and further charged with an acrid or poisonous fluid. An object of prey coming within range of this living battery runs a grave risk of being first struck with the thread-arrows, then paralysed by the poison, and lastly by the motion of the tentacles passed down into the mouth, where its troubles are for ever ended. From the readiness with which the thread-cells burst under very slight irritation, and the extreme sensitiveness of the tentacles themselves, it is evident that the special sense of *touch* is well developed in the sea anemone. When observed in aquaria, they are found to incline towards sunlight, thus indicating their ability to discriminate between light and darkness.

In addition to the well-developed sense of touch and the very rudimentary sense of sight, Mr P. H. Gosse—perhaps the pleasantest writer and best authority on the habits of sea anemones—has shown that these organisms possess the sense of *taste*. This he accomplished by supplying his captive animals with various forms of food, and observing how some, after being taken into the mouth, were rejected with more or less

celerity—presumably according to their degree of unpalatableness—while other forms of food were swallowed and retained.

Although usually fixed to the rock or other anchorage by its disc-foot, the sea anemone has the power of detaching itself at will, and indulging in a somewhat restricted form of locomotion. This it manages either by the movements of its disc, or by turning itself upside down, and, so to speak, changing its tentacles into feet and walking on them.

Having obtained some general idea of the structure and functions of the sea anemone, the question might now be asked: How, after all, does it happen to be classed as an animal? It doubtless has the power of moving its parts as well as moving from place to place; it takes in organised food, digests, and assimilates; it is sensible to sunlight, has the power of stinging, and has the sense of touch well developed. But all these functions are performed in the plant world. The movement of parts in response to sunlight is one of the commonest features of healthy plants; moving from place to place is exhibited in the earlier stages of some land-plants, and is found abundantly in the algæ. Insectivorous plants are strongest when well fed with small flies, &c., which they digest and assimilate, rejecting the indigestible parts. Stinging is a well-known property of the Nettle family or *Urticaceæ*; and besides all that, the structure of many plants is more complicated than that of the sea anemone.

Seeing the sea anemone, then, does nothing but what has its analogue in plant-life, and seeing its general appearance is so much in favour of a plant classification, there must be some further reason for placing it among the animals. As a matter of fact, there is at the present moment no hard and fast definition whereby the plant kingdom can be divided from that of the animals. The drift of increasing knowledge, moreover, tends to render the discovery of such a definition more and more improbable.

In the more highly organised plants and animals, no difficulty is experienced in discriminating between the two kingdoms. In judging of the lower orders, where the difficulty is sometimes great, it is not so much what an organism actually is in itself, but by the direction in which it seems to point, that it is placed in the one great division or the other. Should an organism seem to point in the direction of an undoubted nervous system, it is classed as an animal; and if it points towards a fixed condition and destitute of any indication of nerves, then, generally speaking, it is classed as a plant.

In the forms of animal life lower than the Cœlenterate, sensation is believed to be conveyed through the medium of what is termed contractile protoplasm; but in the jelly-fishes, Mr Romanes has shown that a nervous system exists, though somewhat rudimentary, and it is considered to be the earliest system of the kind in the scale of creation. The sea anemone being somewhat closely related to the jelly-fish, is known to contain in its tissue certain cells which act as nerve-centres. These cells may or may not imply a nervous system; but they are sufficient under the rule just mentioned to warrant their being classed as animals.

While now admitted without question to a place in the animal kingdom, the sea anemone possesses some other features which point to the lowly position it occupies in that kingdom. Trembley discovered that if divided vertically without mutilation, the two parts mended up, and two distinct anemones were the result. The fresh-water hydra, a somewhat simpler Cœlenterate than the anemone, is known to suffer being turned outside in without any apparent inconvenience; and if divided into four, nothing more serious results than that four hydræ will in a short time be found where only one was before. The simpler the animal structure is, the more readily it can adapt itself to the ups and downs of life; and while the anemone may not possess the high degree of adaptability which is enjoyed by the hydra, it all the same has a very tenacious grip of life. 'Granny,' the famous anemone which died a few years ago in a private aquarium in Trinity, near Edinburgh, is known to have been over sixty years old at its death.

The gift of reason is by many authorities denied to the higher animals; and if withheld from them, how much more so from such organisms as sea anemones! Yet in the habits of some of these plant-like animals, qualities are exhibited which can with difficulty be explained unless it is conceded that even in its lowly position the anemone enjoys the light of some faint ray of common sense.

A little anemone, the '*Adamsia palliata*,' has long been known to have a predilection for attaching its disc-foot to the outside of a molluscan shell. The curious point, however, is that the *Adamsia* is almost invariably found attached to the dead shell in which, for self-protection, a hermit crab has taken up its abode. That this is no mere accident is proved by the fact vouched for by Mr Gosse, that when vacating its appropriated shell for more commodious quarters, the hermit is careful to remove with its claws the outside lodger, transfer it to the new shell, holding the disc-foot in position until it had taken hold. This curious arrangement between two animals so widely apart in the scale of life is usually put down as a case of commensalism or animal partnership. The hermit and the anemone are both known to be voracious feeders, and the former is supposed to benefit by the stinging cells of the latter paralysing the prey on which the hermit feeds. In turn, the anemone receives the benefit of the locomotive habits of the crab, and is ever being conveyed to fresh feeding-grounds. Probably it also enjoys some extra fare from the scraps which escape its partner's powerful mandibles.

Dr Herdman of Liverpool has described some specimens recently obtained by the Liverpool Biological Association in their dredging operations between Anglesey and the Isle of Man. These specimens appear to point to some unexplainable bond between the hermit crab and the *Adamsia*; and it is worthy of remark that Dr Herdman's observations only confirm what had been observed and described by Mr Gosse nearly forty years previously. In the specimens just alluded to, instead of the *Adamsia* remaining attached to the shell simply by its glutinous secretion, the disc had grown outwards and round the shell until the membrane had met

on the other side, thus encircling both hermit and shell. Not only had the disc grown round the shell, but the shell itself had become all but absorbed by the vital processes of the *Adamsia*, so that the claws and feelers of the hermit had all the appearance of protruding not from a whelk shell but from the body of a sea anemone. It was also noticed that the mouth of the anemone was right under that of the hermit, so that when the latter was feeding, some crumbs would be certain to come within reach of the waving tentacles of the former.

At first glance, the whole arrangement is apt to be looked upon as a 'dodge' of the wily crab to obtain a sort of 'jackal' or crab's provider. It must be remembered, however, that the anemone might either refuse to take up house with the crab or remove at its own sweet will. In the cases just described it is evident the partnership had existed for a very long period, and the fact of the anemone's mouth being exactly in the position where it would receive a liberal dietary, would tend to show that the anemone was not altogether passive in the arrangement. Indeed, while the crab may be credited with remembering Number One in securing the services of the anemone, it looks very like as if in the *Adamsia* world the securing of a well-doing hermit crab was one of the chances of life not to be despised.

Much pleasant reading on sea anemones will be found in Gosse's *Rambles on the Devonshire Coast*, and his *Aquarium*; while full information as to British species will be found in the manuals of Pennington and Landsborough.

THE HEIR OF ROTHWELL CHASE.

CHAPTER III.

'You will pardon the question, Sir Harry,' went on Dimwade presently—they were strolling up and down the shrubberies by this time—'but do you happen to know of any one who has a spite against you, or who would be likely to revenge himself, or herself, for any fancied wrong or slight, by making off with your grandson?'

'So far as I am aware, I have not an enemy in the world, and I say it with thankfulness.'

'I wish all of us could say the same,' answered the detective with a dry smile. 'Now, in case of anything serious happening to your grandson'—Sir Harry winced perceptibly—'who would be the next heir to the title and estates?'

'My nephew, sir,' he answered shortly.

'May I presume, sir, that you and your nephew are on friendly terms?'

'No, sir, you may not. Friendly terms, indeed!'—with a snort of disdain. 'Nothing of the kind.'

'Um.—And your nephew resides where, if I may ask?'

'In London. Clerk in ship-broker's office, or something of that kind.'

'You could not oblige me with his address, I suppose now, Sir Harry?' This very insinuatingly.

'No, sir; I could not. Don't want to know it. Never want to see his face again—an impudent jackanapes. If you want to find out about

him, ask the Dowager Lady Cosgrave. I have no doubt she can tell you what you want to know.'

It was evident to Dimwade that he had unwittingly touched Sir Harry on a sore place, but it quite answered his purpose to find that he had done so. 'The Dowager Lady Cosgrave,' he murmured to himself. 'Shan't forget.'

Suddenly, Sir Harry came to a halt and grasped Dimwade by the lapel of his coat. 'What's your object—what are you driving at,' he demanded brusquely, 'in asking me so many questions about my nephew?'

'I am simply prosecuting the inquiry, Sir Harry—always, of course, in your interests—in the way in which, according to my judgment of the case as it stands, it ought to be followed up,' replied the detective dryly. 'What we are now considering is the question of motive.'

'But you don't mean to infer that my nephew, the son of my only brother, could be such a consummate villain as to'— He broke off short and stared blankly at Dimwade.

'Not for one moment do I infer anything, Sir Harry. I am gathering information—nothing more.'

Sir Harry walked on, muttering half-aloud: 'What!—my own nephew. No, no! Bad he may be, but not bad enough for that. I'll not believe it.—And yet worse things come to light every day. And then the temptation! Only a child of three between him and the title. (Not but what I'm good for another dozen years yet.) No; it would be incredible.'

At this moment a footman came in search of Sir Harry. Lord Casterton and Mr Blount-Morris, anxious for news, had ridden over thus early to the Chase. Sir Harry hurried away. He would see Inspector Dimwade again a little later in the day.

'There's no call for you to stay longer,' said the London officer to Yardley when the two were left alone. 'Besides, there may be news waiting for you. Of course, the moment you hear anything of consequence, you will send word to the Chase as speedily as possible. Meanwhile, I'll have a quiet look round on my own account.'

As soon as his colleague had taken his departure, Dimwade drew from his pocket a list of the inmates of the Chase and everybody connected with it, either as indoor servant or outdoor, which he had himself drawn up from information supplied him by Sir Harry, and ran his eyes over it as if to refresh his memory. Then he lighted a cigar and strolled in the direction of the stables.

The day wore on without bringing a message of any kind from Superintendent Yardley, while Mr Dimwade went about his inquiries in his own quiet way. Early in the evening, finding there was nothing more for him to do at the Chase, he walked over to Berriefield with the view of ascertaining how matters were progressing there. He found that various telegrams had been received from different points, announcing the arrest of this or the other suspicious character, only to be followed up by other messages an hour or two later to the effect that the said suspicious characters, having been able to give a satisfactory account of themselves, had been duly set at liberty. Four-and-twenty hours

had now gone by since the disappearance of the heir of Rothwell Chase without bringing the faintest clue to the mystery. It may be that Inspector Dimwade was more puzzled than he cared to confess; but in any case he put a good face on the matter, even to his friend Yardley.

No news being forthcoming by next morning, Mr Dimwade travelled up to London by the forenoon train. In the course of the following day he carried out a certain inquiry on which he had set his mind—that is to say, he satisfied himself that Evan Marchmont had not been out of London, nor, indeed, away from his office duties, on the day of the abduction.

The only thing now left for him to do was to report to headquarters that, so far, he had nothing to report, which is not a pleasant statement for a zealous officer to have to put his name to. Of course, he would still continue to keep an eye on the case, while trusting that the active search which was being everywhere prosecuted would not fail in finding, ere long, some traces of the child, either living or dead.

Two days later, Sir Harry Marchmont, without consulting anybody, put forth the offer of a reward of two hundred and fifty pounds for the recovery of the missing heir, an offer which, after the lapse of a week, was doubled in amount.

During this time, Inspector Dimwade came and went more than once between London and the Chase; but all the laying together of heads, as between himself and Superintendent Yardley, seemed to bring the mystery no nearer a solution than it had been all along. Then presently Dimwade's services were requisitioned for the unravelling of a famous poisoning case, and he was seen no more at Berriefield or the Chase.

As day succeeded day without bringing any tidings of the lost child, the cloud which had settled over the Chase and its inmates deepened and darkened till the torch of hope, which had burnt so brightly at first, was all but quenched in utter gloom. All felt the influence, from highest to lowest. Sir Harry moped about the house, a disconsolate and forlorn old man, out of whose life nearly all its remaining spring and energy had faded in a few short days. Even the servants went about their duties with hushed voices and subdued demeanour, as though some one lay dead in the house.

Sir Harry had never realised till now, not merely how dear the lost boy was to him, but to what an extent his hopes and ambition were wrapped up in him. It seemed strange, but he had never cared for his son when a child as he cared for this younger Frank. Now that his own term of existence was drawing towards a close, the young life which in the natural order of things would 'take up the running' when for him the race should be over, had an attractive force such as had never drawn him towards the boy's father at a time when death—his own death—had seemed as yet nothing more than a pale phantom only dimly to be discerned through the long vista of the years to come.

Sir Harry, who himself opened the postbag and distributed the letters, had more than once in the course of the last twelve months felicitated himself in secret on the fact that he never

came across a letter to his ward addressed to her in a masculine hand, and had, in consequence, laid the flattering unction to his soul that, whatever might be the state of their feelings towards each other, the engagement between Edeline and his nephew had not so far developed that acute stage of the disorder which strives to console itself for the absence of the beloved object by frequent epistolary communications. But in so thinking, Sir Harry deceived himself, or, rather, was deceived by his 'scapegrace of a nephew.' Evan Marchmont's letters, of which Edeline received one each week without fail, were invariably addressed for him by the wife of the friend with whom he lodged, so that the baronet, who was aware that his ward still kept up a correspondence with some of her school-friends, after a casual glance at the address, passed his nephew's letters on to her in bland unconsciousness of the real contents of the envelope. Miss Fenton's conscience did not fail to prick her now and again, for although the ruse was a harmless one, it was a deception none the less. Yet, on the other hand, for her lover to have openly addressed his letters himself would in all probability have sufficed to rouse Sir Harry's irascible temper, and have ended by provoking a scene between herself and her guardian which would have been productive of no good result on either side. For this reason it was that Edeline continued to accord a tacit sanction to the scheme devised by her lover, in preference to risking a rupture between her guardian and herself.

In the establishment in which Evan Marchmont was employed the annual holidays had of necessity to be spread over a period of several months, so as to ensure that too many members of the staff should not be away at one time. As a result of the arrangement in question, it so happened this year that Evan's holidays had to be taken some three or four months earlier than was agreeable to him. As soon as the date had been fixed, he wrote to Edeline, informing her of the fact, as also that he should spend a certain portion of the time at Berriefield, it being quite out of the question that he could sustain existence any longer on no more satisfactory diet than a letter once in seven days.

Evan was not quite a stranger to the Chase or its neighbourhood. Three summers before, he had come down to Berriefield during the annual absence of the family, and, by dint of a little judicious bribery, had been allowed to see over the mansion and explore the grounds. The Chase had been the home of his ancestors for several generations, as also the birthplace of his father, and Evan had been actuated by a laudable desire to become acquainted with the old roofter, although, through no fault of his own, he had been compelled to do so surreptitiously or not at all.

It was in a certain natural glade, or clearing in the grounds, known as the Chestnut Walk, that Evan and Edeline had agreed to meet. The so-called Walk was in the heart of a thickly-planted belt of woodland, and could only be reached by a couple of narrow winding paths through the trees, one at either end. It was a most secluded spot, and the lovers felt that there, if anywhere, they would be safe from observation. Close to one end of the Walk was a long-dried-up

fountain, the massive masonry of which, now covered with moss and lichens of various kinds, was falling more completely into ruin year by year.

Our lovers had not met since Evan's stormy interview with his uncle, a year before, when the baronet had carried off his ward to the Chase, fully determined to do all that lay in his power to keep the young people asunder. That they had much to say to each other this afternoon which would in nowise interest any third person, may at once be assumed; therefore, we will discreetly allow them a quarter of an hour to themselves before venturing to intrude on their privacy.

As a matter of course, Evan had already heard all about the disappearance of his youthful cousin, both through the newspapers and by means of the ample particulars which Edeline had supplied him with from time to time. To-day, however, as they paced the Chestnut Walk arm in arm, he heard the story afresh from her lips, and thereby had the affair brought more vividly home to him than by either the printed or written details while he was at a distance.

'By the way, dear,' said Edeline, 'I think I understood you to say just now that you have taken up your quarters at the Black Swan Hotel. If so, you have Mr Romer Vodney for one of your fellow-guests.'

'And who may Mr Romer Vodney be?'

'A private inquiry agent—in other words, a private detective—who made his appearance at the Chase a few days after Inspector Dimwade's last visit, and asked your uncle's sanction, which it is scarcely needful to say he at once obtained, to his starting an independent investigation on his own account.'

'Of course, this Mr Vodney did not appear on the scene till after the offer of the five hundred pounds reward. Such fellows never do.—By the way, what kind of looking man is he?'

'Tall, very thin, and somewhat round shouldered; clean shaven, with sallow aquiline features; keen restless black eyes, and an unkempt mass of oily-looking black hair. In age about thirty.'

'A study from the life, and one which renders it impossible to mistake the fellow. He was in the billiard-room last evening when I strolled in, and there was something peculiar about him which caused me to wonder who and what he could be. In any case, he is decidedly clever with the cue, and contrived to pocket sundry half-crowns during the hour or so that I remained in the room.'

When at length the lovers contrived to tear themselves apart, it was with a mutual promise to meet at the same hour and place the following afternoon.

'I have been making a few quiet inquiries about Mr Vodney since I saw you yesterday,' said Evan. 'At the hotel, nobody seems to know his business or anything about him; not, perhaps, that that is to be wondered at, seeing he may not improbably have his own reasons for keeping his profession a secret. But what does seem singular is the fact that he never rises till close on mid-day, and that both his afternoons and evenings are invariably passed in the billiard-room. If he goes out at all, it is merely for half

an hour's stroll in the town with a cigar before dinner. Now, what I should like to know is, how a man who spends his time as Vodney spends his, can, as a matter of fact, be ferreting out and piecing together the details of a case which has admittedly baffled the efforts of two experienced and trained officials. That is a problem which I confess I am altogether at a loss to solve.'

'One of Mr Vodney's most significant remarks to your uncle,' replied Edeline, 'was to the effect that if the theory he had formed of the mystery were the right one, the clue to it must be sought not inside the Chase but outside it.'

'All which in no way tends to make his conduct seem less unaccountable. By the way, has he been to the Chase at all since the first occasion of seeing my uncle?'

'Yes; he was there only two days ago.'

'Ah! And what had he to say for himself?'

'What he said was, that he felt nearly sure he had hit upon a clue which in the course of a few days would put him on the right track, but that he would refrain from saying more just then.'

'Did he ask my uncle for any money in the way of an advance towards any expenses he might have been put to?'

'No; he did not even hint at such a thing.'

Evan tilted his hat an inch farther back on his head. 'All I can say is that I'm more mystified than ever,' was his remark. 'I wish I knew the fellow's London address—if he has one.'

'Then your wish can very easily be gratified. His address was printed on the card he sent in to your uncle the first time he called at the Chase. It is No. 5a Heathfield Gardens, W.C.'

Evan at once proceeded to take a note of the address in his pocket-book. That evening, after he got back to Berriefield, he telegraphed a certain question to one of his friends in London. By noon next day an answer came to the following purport: 'No such person as the one named in your message is known at the address given by you.'

This reply did not fail to deepen the feeling of distrust with which Evan had already begun to regard Mr Vodney and his pretensions. Yet, to suppose that the man was simply an impostor, who had been induced to take up the case by the hope of obtaining the reward, was scarcely a feasible assumption in view of the fact that the five hundred pounds would not be forthcoming except in return for some *bond-fide* information which would lead to the recovery of the boy. The more Evan considered the affair the more puzzled he became.

When he met Edeline again, which he did that afternoon in the Chestnut Walk, they could only wonder and surmise together, and put questions to each other which, till further enlightenment should come from some quarter, there was no possibility of their being able to answer. Between whiles they had their own personal matters to attend to—sweet confidences to exchange, vows of unalterable love to reiterate—not that any such iteration was needed on either side, but simply because it is so sweet to be told again and yet again by the lips most dear to us that we are beloved.

When Evan got back to Berriefield, he found, to his chagrin, that he had either lost or mislaid

a silver cigarette case by which he set great store. It had been the gift of a dear friend, since dead, and he valued it accordingly. At once he called to mind that he had had it last that afternoon in the Chestnut Walk. While waiting for Edie, he had sat down by the ruined fountain and lighted a cigarette; then, instead of putting the case back into his pocket, he must, in pure absent-mindedness, have laid it down on the stonework and there have left it. The question was, whether he should go back at once and search for it, or risk leaving it where it was till he met Edie there on the morrow? The place was a lonely one, and little likely to be intruded on meanwhile; still, he felt that he should not readily forgive himself if his dead friend's gift were lost through any remissness on his part. The evening was a fine one, he was tired of the hotel and its company, and he decided that he could not do better than go back and search for his missing property.

On this particular evening he found himself back at the fountain in due course. There, just as he had left it, was the cigarette case he had come in search of. The moon was rising by this time. It was not yet high enough in the heavens to overtop the loftier branches of the encircling trees, on which the tender buds of spring were here and there bursting into leaf; but its rays, filtering through them, made an intricate silvery network on the turf of the glade—fit ballroom for elves and fairies and other shy creatures of the night, whose revels the 'inward eye' of Phantasy alone is privileged to behold.

So still and beautiful at this hour was the spot, that Evan, heated somewhat by his walk, seated himself where he had sat in the afternoon, and proceeded, after the fashion of his age and kind, to conciliate the tutelary spirit of the place by a burnt-offering in the shape of tobacco. Then he fell to thinking about his lady-love, and what more delightful occupation could any young man have at such an hour and in such a place? His meerschaum had burnt itself out without his being aware of the fact, so immersed was he in the pleasant process of aerial castle-building, when something broke his reverie on a sudden and caused him to look up with startled eyes. From the footway which gave admittance to the glade at the point nearest the Chase, a dimly-outlined female figure had glided into view, and after advancing a little way over the checkered floor of silver bar and shadow, now stood motionless as in the act of listening. Evan's first thought was that it was Edie, whom some strange chance or magnetic attraction had brought there again at the very time he was thinking about her; but a longer and steadier look convinced him that he was mistaken. So far as he could make out, the woman was a stranger to him. Where he sat he was in deep shadow, being hidden in part by the broken masonry of the fountain, and in part by the low-spreading branches of an ancient yew which grew close by. Actuated by one of those instincts which work in us without consciously bringing into play any portion of our reasoning faculties, he moved slowly and noiselessly back into a space of still deeper shadow, where it would be impossible for any one to discern him from a greater distance than three or four yards, but whence the entire space of moonlit

glade was clearly visible to him. Scarcely had Evan accomplished this before a man came quickly into the glade from the end opposite that by which the woman had arrived, and passing within half-a-dozen yards of the fountain, went directly up to her, while she on her part advanced to meet him, and putting one arm about her, drew her to him and kissed her three or four times.

In the man, to his intense astonishment, Evan at once recognised Mr Romer Vodney. But who was the woman?

WITH THE BLIND OF SWITZERLAND.

ON the outskirts of that most delightful of lake-towns, Lausanne, stands a modest mansion, whose unpretending exterior gives no clue to the grand work going on within. Indeed, so little does it draw attention to itself, that but for friendly guidance, we should have been puzzled to find the building. As it is, we have not chosen a visiting hour, and the white-capped *conciierge* is doubtful whether M. le Directeur is at liberty. But an intimation that the welfare of the blind is of special interest to the English visitor proves a passport, and we are speedily ushered into the private sitting-room of the head of the establishment. Keen-eyed, business-like, and yet kindly, is our host, and by no means afraid to emphasise the absorbing interest he takes in his work. He has but recently returned from a visiting tour through the principal countries of Europe, and is full of information as to the various methods pursued in blind institutions of other lands; indeed, it has seldom been our experience to meet with any one so entirely given up, heart and soul, to any special interest; and it is not surprising to learn from other sources that this 'Asile des Aveugles' owes much of its success to the zeal and energy of its Directeurs.

The very ponderous volumes on the shelves with which the room is lined suggest inquiry as to the state of blind-literature, and we are speedily initiated into the mysteries of the various forms of embossed type in use. According to our enthusiastic host, there can be no question as to the superiority of the 'Braille' alphabet both as regards size and simplicity. How important is the first consideration will be seen in the fact that the complete 'Bible for the Blind' is composed of thirty-two folio volumes, weighing about one hundred and twenty pounds, and costing over one hundred and fifty francs!

'Do you get your books from Paris?' we inquire.

'At present we do. Most of our music comes from there, and a good many school-books; but, unfortunately, the type is the ordinary Roman; and so we can only look upon them as a *pis aller*, until we get our own printing-works into order again.'

'Has the institution done much printing in the past?'

'Yes; a good deal. For instance, when the Asile was founded in 1844, the only portion of the Bible [French] printed in relief was the gospel of Mark, and this in Roman lettering. But by the end of 1867 the institution had printed eight thousand six hundred and twenty-five volumes, including the completed Braille

Bible, a collection of Hymns with tunes, a History of Switzerland, a Geography Primer, and a volume of Poetry and Fables.'

'But here, in Switzerland, you must need German books as well as French?'

'Unfortunately, that is an addition to our library troubles. But the bulk of our teaching is in French, and we find our stock of a portion of the Bible, a hymn-book, and three reading-books, enough for German needs.'

'But at best you could have only a limited selection of lesson-books. Do you rely on them as the chief method of instruction?'

'Oh no. Most of our work is done by means of oral teaching.—But you will see in here'—leading the way to the schoolroom—'we have a good many aids apart from books.—Marie, mon enfant'—to a bright child of eight—'come and show our visitors where is "la belle Suisse."'

And in a minute the little hands pass with delicate touch over the elevations and depressions of an embossed map and light in triumph on the mountainous district that tells of 'La Patrie.' The less interesting land of the visitors is also quickly found; and we are assured that broad geographical outlines are as easily taught to the blind as to the seeing.

Our little show-woman is one of the born blind to whom the deprivation comes very much as a matter of course, at least in childhood; and her face bears every mark of lively intelligence in spite of its blank sightless eyes. But Marie is perhaps exceptionally bright, and certainly enters into her work with far more zest than her companion Louise, who is decidedly inclined to pout over her writing lesson. The slate on which she is learning to form letters is an ingenious contrivance, by means of which no greater difficulty meets the blind pupil than besets the path of the seeing child who attempts the mysteries of lines and pothooks. But Louise does not share our admiration of her copy-book; and as we praise it, she lifts up an indignant face, lighted by eyes so wide open and clear, that it is indeed difficult to believe that she is doomed to a life of darkness.

But apart from learning, which she hates, Louise is cheerful enough to be a contrast to the next pupil, who attracts our attention in the classroom which we now enter. Such a woful face turns instinctively towards the opening door, and the hopelessly injured eyes tell their own tale of sudden overwhelming calamity! A working lad of sixteen, the victim of an explosion, he is now slowly and painfully trying to begin life afresh under sadly altered conditions. The alphabet is his task at present; but the heavy fingers have as yet no special delicacy of touch, and it needs all his teacher's kind encouragement to induce him to persevere.

'Pauvre garçon,' says the Directeur as he closes the door behind us. 'But he will get more hopeful as time goes on.—Ah, Hermann'—as we come across a well-grown lad of fourteen—'we will return with thee to the little schoolroom, and thou shalt show us how thou canst read.—Now, go to the bookcase and take down the first book that comes to hand.'

Hermann goes across the room unhesitatingly, and returns with a ponderous volume, from which he proceeds to read with admirable fluency,

his German accent alone betraying the fact that he is not dealing with his mother-tongue. The sorrowful face of the poor young labourer has been eagerly turned towards the reader; and putting a fatherly hand on his shoulder, the Directeur says heartily: 'Courage, mon ami.—Hermann was in just thy condition a year ago; and now, see! he can not only read, but can find his way about as easily as you both did before your sorrows.'

A faint smile comes over Henri's face as Hermann asks if he may take his companion out of doors for a walk and talk.

'By all means,' says the Directeur; then explains to us: 'You see, this is not regular school-time; all the classes are held in the morning; and in the afternoon, those who are not advanced enough to learn from books, receive individual attention at our teachers' convenience.'

'And how far do your pupils go in general knowledge?'

'Well! we have three classes into which the school is divided. In the lowest, they take reading, recitation, arithmetic, singing, and sacred history, in addition to object lessons and manual work. The next grade goes on to grammar, spelling, history, geography, elementary physics, writing, and the theory of music; and in the highest class, composition and analysis are added. Then the boys do a good deal of gymnastics; and those girls or boys with special musical taste receive instruction on piano or organ.'

'Is it true that the blind are particularly fond of music?'

'Yes; I think, broadly speaking, it is so. There is certainly no doubt of their appreciating our fortnightly musical evenings, when various ladies and gentlemen give them the treat of vocal and instrumental music. But as regards turning the taste to practical account, I cannot say it provides a living for more than one or two occasionally.—'This,' leading the way to the *atelier*, 'is our best hope as regards the future of the majority.'

The *atelier* is divided into various departments, in each of which are workers of every grade, from the beginner, who is proudly feeling over his first production, a rough *hotte* for vineyard use, to the high-class workman who is putting the finishing touches to an elaborate flower-stand.

Every variety of cane and wicker work is undertaken in this hive of industry, and it is curious to note the possibilities of what would seem but a limited trade. Baskets of every size, shape, pattern, and colour, are arranged in tempting order; there is an almost endless selection for paper, linen, work, and flowers; whilst on the utilitarian side are marketing baskets to meet the needs of any sized families; and receptacles for bread, grocery, fruit, and bottles, keep company with fancy kennels for household pets. There is also a choice of garden furniture—some distinguished as *forme anglaise*!—and a specialty in travelling dress-baskets strikes us as particularly good. The very best quality and largest size is marked ten francs fifty centimes—a price that would not compare unfavourably with those of London or Paris.

Of course, the inevitable chair-caning is one of the Asile industries; and there is also a show

of Swiss wood-carving. One worker is particularly proud of his *bonbonnières*, and is anxious to show how admirably they fit into the waist-coat pocket. But we blush to remember how far behind the age is the average Englishman, who does not consider his lozenge box as an essential make-weight for his tobacco-pouch!

In the women's department are also very creditable specimens of handiwork at strictly moderate prices; but it is satisfactory to learn that all is sold at a fair profit, and that every material used is thoroughly good of its kind. A good many of the employees are of considerable age: one, we are told, entered the institution at forty-five, being the father of five children; and four others are between the ages of twenty-five and fifty. Of course, in such cases, loss of sight is the result of illness or injury, and learning is a much slower process than with those who possess naturally the marvellous sensitiveness of the born blind. At the same time, they have of course the stimulus of experience, which prompts them to 'make hay while the sun shines;' and not a few exhibit heroic patience in the struggle to make a fresh start.

In addition to such adult apprentices, there are always a certain number of boys and girls from the school under *atelier* instruction.

'And what becomes of them when they leave?'

We inquire. 'Well! we have one training to be a piano-tuner; another is an organist, and plays at evening parties; and a good many carry on basket-work at home with at least sufficient success to prevent their being a burden on friends. Some of course do much more than this; but we reckon that with average intelligence and perseverance, no pupil after passing through our course need be a trouble to himself or others.'

'And suppose the health fails or the home is broken up, have you any fund for helping such?'

'Oh yes; we have a *caisse de secours*, which provides small pensions for several former pupils, besides supplying temporary help for many.' And the Directeur goes on to give many interesting details, which space—or lack of it—prevents our quoting. But an interruption comes in the shape of a tall, well-made, young fellow who ventures to attract our entertainer's attention, with many apologies for the fact that he will only just have time to catch the train for Geneva, where, we gather, he has secured a situation as clerk. He is introduced to us as a wonderful case of recovery. Coming into the Asylum totally blind, in spite of a series of operations, the doctor of the institution ventured on still more radical treatment, with so happy a result that 'Edouard' is once more able to take his place on the ordinary level of life.

And this brings us to the most marked feature of this Swiss Asile—its ophthalmic hospital, where diseases of the eye are treated by an accomplished specialist.

In the first ward we enter, a baby of eighteen months is sending forth a pitiful wail, so suggestive of suffering that we naturally inquire as to the severity of its ailment. But the Directeur shakes his head, and explains that a first lesson in obedience is the origin of lamentation.

'Have you much difficulty in that way?' we ask.

'Yes, indeed; it is our greatest trouble, and much harder to deal with very often than the ophthalmia. You see, in their own houses the mothers think it will not do to let the eyes be hurt by crying, and the tempers get so spoilt, it is a matter of great difficulty to get a fair chance for treatment.—Look yonder,' he adds, pointing to a working-woman walking up and down another ward with a heavy boy of two in her arms. 'See what a burden that poor soul has made for herself! That child no more needs hushing-up than you or I; but his mother has made herself such a slave, she is not only unable to go out to work, but her tyrant will not even allow her to sit down when he is awake.'

'And are you obliged to take her in as well as the child?'

'For a few days, until the first novelty has worn off. But as soon as the boy is accustomed to the place and people, she will have to leave him; and I can assure you, in a week's time he will be as good as little Fritz over there.'

Fritz, also hardly out of babyhood, is amusing himself in perfect content, although his bandaged eyes really do give him a good bit of pain, and he is, moreover, troubled with an irritating skin affection. The latter, the Directeur explains, is the direct result of lack of cleanliness, also an important element in the production of infantile ophthalmia.

'But,' he adds, 'I must confess that there is very decided improvement in this respect on the whole, and indeed the proportion of cures amongst the young continues to steadily increase.'

'And do you think Fritz will recover?' asks my friend.

'Oh yes. Monsieur le Docteur is quite sure he will be able to see in time; but it will be a question of patience. Very different from a case I will show you in the next ward.—Ah, Adèle, is it light now?'—addressing a trim young woman who wears a shade over both eyes.

'Mais, oui, Monsieur,' is the joyful response. 'And to think I shall be able to see all their faces again when I go back!'

'Were you quite blind?' we inquire.

'Yes, indeed, quite, quite. I had lived in the terrible dark for months that seemed years; and I could not believe Monsieur le Docteur when he told me I should see again if I would let him cut my eyes.' As she speaks, an amused smile flits over the face of a patient in bed close by, and the Directeur inquires what is tickling her fancy.

'Ah, Monsieur,' she replies, 'I was only thinking how I told the doctor who said the same to me, that I would rather be blind than be operated on.'

'But you changed your mind?'

'Yes, indeed. When my poor mother became ill and my sister had to stay at home to nurse her, I could no longer refrain from anything that might make me able to help them both.'

'And did you find the operation so very bad?' we ask.

'No, no; indeed, it was partly that made me smile. They just put me to sleep; and when I woke up, it was all over. Yesterday, the doctors took my bandages off for a minute; and oh, Monsieur, I could see!'

The exultant joy of the last words could hardly

be surpassed, and led naturally to the question: 'Are most of the operations successful?'

'Of that particular class, yes, as a rule. But of course a good many patients apply where no treatment, medical or surgical, can be of the slightest good.'

'And as a broad rule, is there much suffering in the generality of cases?'

'On the whole, I think not so much as people imagine. The young man leaning his head on his arms, in the first male ward, has suffered agonies from neuralgia of the optic nerve, and sometimes there is a great deal of pain outwardly; but I should say that in the majority of cases diseases of the eye and operations are less painful than popular fancy pictures them. Indeed, it is not in its suffering, but in its isolation and helplessness, that blindness falls so heavily on the working-classes; and in countries where the labour market is already overstocked, the man who cannot see is at a terrible disadvantage.'

Whilst talking thus, we have made the tour of the premises; and as we return to the entrance hall we catch sight through an open door of a cosy little room fitted up for one inmate.

'Is this a room for private patients?' we inquire.

'It used to be one of four reserved for those able to pay more than the cost of board; but the system was found liable to abuse; and indeed we need all our forty-five beds for the really poor.'

'And do they pay the cost of board?'

'Yes; there is a fixed charge: one franc fifty centimes a day for adults, one franc for children under fifteen; and this is only reduced when the applicant is furnished with an *acte d'indigence* from the municipality.'

'Is a subscriber's letter needed?'

'Oh no; that is not our way. The hospital is open to all who need—and "need" is the only passport.'

'Are its benefits for Swiss only?' we ask.

'Mainly, of course. But we do not shut our doors upon strangers; and'—with a smile and bow—'we have even had the pleasure of an occasional English patient!'

Certainly, considering the size and population of Switzerland, her blind are provided for on a scale that would well bear comparison with larger countries; and no one interested in the afflicted could fail to be pleased with the completeness of the work accomplished in this *Asile des Aveugles de Lausanne*.

A MARRIAGE MADE IN HEAVEN.

CHAPTER II.—CONCLUSION.

THE schoolmaster proceeded to think over the matter—that is to say, he proceeded to muse over it; by which process he did not face the facts as they were—did not become better acquainted with the real Miss Blakely, who, although an estimable woman in her own way, with something of a good heart at bottom, was not an attractive personage, or one at all fitted to make him happier by reigning over his domicile. In his musing, however, he did make a sort of progress in another way, for he conjured up an ideal Miss Blakely, gentle and good,

cheerful, with intellectual tastes like his own, a person who, like himself, had not fared happily in the world until now, and for whom his love and protection would make a paradise of the remaining years of her life, as her gentle sympathy would make of his. It did occur to him, occasionally, that the picture he was drawing might not be quite correct, and at those times he would emerge from his sitting-room to go into the kitchen, where, except in the evening, Mrs Sims held her court, and would ask a few questions of this oracle by way of adjusting his own ideas to the truth. Poor Mrs Sims, between her extreme honesty and her desire to see the schoolmaster, whom she really loved, assured of future comfort before she left the place, had much ado to be 'tactful' and say the right thing. She naturally, however, regarded comfort as pertaining solely to the outer man, and fully believed that this marriage was the best step he could take; so her answers, when they could not be satisfactory, were vague. The schoolmaster's questions were certainly not always just what might have been expected under the circumstances, and some of them were more easy to answer than others. After a premonitory query or two, one day he stood thoughtfully stroking his beard beside the kitchen dresser, quite regardless of all that was going on in the way of dinner around him.

'Ah—you said, I think, Mrs Sims—or perhaps I only imagined it—but perhaps I am not altogether wrong in supposing that Miss Blakely had a mother?'

'Oh yes, sir, that she had,' said the widow without hesitation.

'Ah, I am glad of that,' he said with a sigh of relief, thinking of the love and loss which had been the romance and tragedy of his own life. 'And she died, I suppose?'

'I suppose so,' said Mrs Sims, 'for she's not living.'

At that moment the schoolmaster was almost persuaded to think well of the scheme proposed to him, and to write the letter; but before this was accomplished he began to doubt again, and went through quite a prolonged period of indecision, of despondency as to his own chances of acceptance, and hesitation as to the advisability of the arrangement altogether.

During this time Mrs Sims was at great pains to dispel his fears. 'How can you doubt, sir, that you'll be much happier with a wife to cook your meals regular, and no more bother about changements all your life? I'm sure if I were you, sir, I wouldn't hesitate between the joys of matrimony and single life.'

'Perhaps not, Mrs Sims; but I, being I, do hesitate. It is a very important step to take, just because, as you say, there will be no more change.'

'And it's just you that have been telling me that the very thing you dislike most in this world is change. And there are other advantages, too, in having kith and kin, for it's lonesome without when you're old; and just think how beautiful for a wife to weep over you when you're a-dying—and she'll do all that, Miss Blakely will, sir; I'm sure, as her friend, I can answer for it.'

'The wills above be done,' murmured the

schoolmaster, 'but I would fain die a dry death.'

However, as his housekeeper said, time pressed, and, perhaps as much by natural reaction of cheerful feeling as by the force of her arguments, in the course of a few days the schoolmaster was again disposed to take a more favourable view of the plan. Still he procrastinated; and the very evening before the widow's departure had arrived, and yet nothing was done. Then it happened, as is frequently the case when the mind is balancing between two opinions, that a very small circumstance determined him to write the all-important note. The circumstance was none other than his having a convenient opportunity of sending it; for to him, as to many other unpractical minds, the small difficulties in the way of any action had as great a deterring power as more important considerations. Miss Blakely happened to live on the other side of the town, and though the master walked much farther than that himself every day, he felt that in this case it would hardly be dignified to be his own messenger.

It was early in the evening, and the master's window was open to the soft spring air that came in full of the freshness of young leaves and flowers and the joyous splash of the flooded river. He observed two of his school-boys loitering under the window, evidently wishing to speak to him, yet too bashful; so he got up, and went and sat on the window-sill, and smiled at them, and they smiled back. They had a tale to tell; but, as it was of a somewhat delicate nature and hard to explain, he had to listen very patiently. They had a dollar—a brown and green paper dollar—which they gave him with an air of solemn importance. They said that they and some of their comrades had been a long way from home gathering saxifrage, and that they had met one of the young ladies of the town. She had her arms full of flowers, and her pocket quite full of moss, so full that she had had to take her purse and handkerchief out and hold them in her hand with the flowers because the moss was wet. When she came upon them, they were trying to get some saxifrage that was on a ledge of rock; they could only climb half-way up the rock, and were none of them tall enough to reach it; so she put down all her flowers and things and climbed up and got it for them; but in the meantime one of them opened the purse and took out the dollar. She never found it out, and went away.

'Not either of you?' said the schoolmaster.

'No, sir; one of the other fellows did it. But he's sorry, and wants to give it back; so we said that we would tell you, and perhaps you would give it to her.'

'Why couldn't you go and give it to her, just as you have given it to me?'

'Because we knew you'd b'lieve us that it was just the way we said; and her folks, you know, might think we'd done it when we said we hadn't. Or, mother said, if you didn't want to be troubled, perhaps you'd just kindly write a line to say how it was, and we'll go and leave it at the house after dark and come away quick.'

The master had no objection to this; so he

brought the boys in and got out his best note-paper—for he was fastidious about some things—and he wrote a note beginning 'Dear Madam,' telling in a few lines that the money had been stolen and restored.

'What is the lady's name?' he asked, taking up the envelope.

'It was Eelen Reid, sir; Mr Reid's daughter that keeps the shop.'

So the schoolmaster wrote 'Miss Eelen Reid' in a fair round hand and then he paused for a moment. He was making up his mind to the all-decisive action.

'Perhaps you can wait for another note and take that for me at the same time,' he said. He gave them some picture papers to look at. Then he wrote the note of such moment to himself, beginning, as before, 'Dear Madam,' and doing his best to follow the many instructions which the faithful Mrs Sims had given him. It was a curious specimen of literature, in which a truly elegant mind and warm heart were veiled, but not hidden, by an embarrassed attempt at conventional phrases—a letter that most women would laugh at, and that the best women would reverence. Then he addressed that envelope too, and sealed the notes and sent away the boys.

There was no sleep for the schoolmaster that night. With folded arms he paced his room in restless misery. Now that the die was once cast, the ideal Miss Blakely faded from his mind; he felt instinctively that she was mythical. He saw clearly that he had made a terrible mistake, that he had forfeited the best possibilities of life for the sake of temporary convenience, that he had sold his birthright for a mess of pottage.

The long night passed at length, as all nights pass. The sun rose over the purple hills to glow upon the spring-stirred forest and to send his shafts deep down into the clear heart of lake and stream. The fallen beauty of past woodland summers had tinged the water till it glowed like nut-brown wine; so brown it was that the pools of the river, where it swirled and rushed past the school-house bend, seemed to greet the sun with the soft dark glances of fawn-eyed water-sprites. The glorious sky, the tender colours of the budding wood, the very dandelions on the untrimmed bank, seemed to contrive their hues to accord and rejoice with the laughing water, and the birds swelled out its song. In the rapture of spring and of morning there was no echo of grief; for the unswerving law of nature, moving through the years, had set each thing in its right home. It is only the perplexed soul that is forced to choose its own way and suffer from the choice, and the song of our life is but set to the accompaniment of a sad creed if we may not trust that, above our human wills, there is a Power able to over-rule the mistakes of true hearts, to lead the blind by unseen paths, and save the simple from their own simplicity.

Very early in the morning the schoolmaster, haggard and worn, slipped out of his own door to refresh himself in the sunlight that gleamed down upon his bit of green through the budding willow-trees that grew by the river-side. He stood awhile under the bending boughs, watching the full stream as it tossed its spray into the lap of the flower-fringed shore. He looked, as he stood there, like a ghost of the preceding

night, caught against his will and embraced by the joyous morning. Just then he had a vision.

A girl came towards him across the grass and stood a few paces distant. The slender twigs, with their hanging catkins and tiny golden leaves, made a sort of veil between them. She was very beautiful, this girl, at least so the schoolmaster thought; perhaps she was the personification of the morning, perhaps she was a wood-nymph—it did not matter much; he felt, in his excitement and exhaustion, that her beauty and grace were not real, but only an hallucination of moving sun and shade. She took the swaying willow-twigs in her pretty hands and looked through them at him and stroked the downy flowers.

'Why did you send me that letter?' she said at last, with a touch of severity in her voice.

'I didn't,' he said, without pausing to think what she could mean.

'Yes, you did,' she replied seriously, looking at him with large, earnest eyes.

He remembered now, with a sort of dull return of consciousness, that he *was* guilty of having sent a letter—terribly guilty in his own estimation—but it was sent to Miss Blakely, and this was not Miss Blakely; he had taken the precaution to know her by sight at least before he took the final step. And that one letter had so completely absorbed all his mind that he had quite forgotten any others that he might have written in the course of his life.

'You certainly did write it,' she repeated, with a slight tone of indignation in her voice; 'and if you had any reason for writing it, I don't see why you should deny it now.'

'Do not be angry with me,' he said imploringly. He had but one idea, that was, to keep this radiant dream of beauty with him as long as possible.

'I'm not angry,' she replied, becoming gentle at the first tone of entreaty on his part; 'indeed, I am not angry at all—indeed'—and here she looked down at the twigs in her hand and began pulling the young leaves rather roughly—'I am not sure but what I am rather pleased. I have so often met you out walking, you know; only I didn't know that you had ever noticed me.'

'I never did,' said the schoolmaster; but happily his nervous lips gave but indistinct utterance to the words, and his tone was pathetic. She thought he had only made some further pleading.

'I—I—I like you very much,' she said. 'I suppose, of course, everybody will be very much surprised, and mother may not be pleased, you know, just at first; but she's good and dear at heart, mother is, in spite of what she says; and father will be glad about anything that pleases me.'

He did not understand what she said; but he felt distressed at the moment to notice that she was twisting the tender willow leaves, albeit he saw that she only did so because, in her embarrassment, her fingers worked unconsciously. He came forward and took her hands gently, to disentangle them from the twigs. She let them lie in his, and looked up in his face and smiled.

'I really will be a very good wife to you, and manage all the common things, and not tease you to be like other men, if you will sometimes

read your books to me and explain to me what life means, and why it is so beautiful, and why things are as they are.'

'I'm afraid I don't understand these matters myself very well,' he said; 'but we can talk about them together.'

'So we will,' she said contentedly; and then she put her arms round him and gave him a kiss.

No one had kissed him since his mother died, and the great joy that took possession of his heart brought, by its stimulus, a sudden illumination to his dazed mind. In a marvellously tender way, for a man who could not go a-courting, he put his hand under the pretty chin and looked down wonderingly, reverently, at the serious, upturned face. 'And this is Eelen Reid?'

Then Eelen, thinking that he was teasing her gently for being so easily won when she had gained the reputation of being so proud, cast down her eyes and blushed.

So they were married, and lived happily, very happily, although they had their sorrows, as others have. The schoolmaster never told any one of his blunder except his wife, and she found in it a boundless source of comfort, for, in her simple faith, she took it as a proof that God himself had sent his angel, whom the earth calls Chance, to teach them the glad lore of love.

As for Miss Blakely, she never quite understood who had stolen the dollar, or when, or where; but she was glad to get it back, especially as she had a serious disappointment about the same time. She found it hard to forgive Mrs Sims for having managed her trust so ill, although the widow declared, with tears in her eyes, that she had done her best.

'He would have taken in the knowingest person, he would indeed, Ann Blakely; and, to my notion, a straightforward woman like you is well quit of a man who, while he looked so innocent, could act so deep.'

THE SOUTH-WEST MONSOON.

THIS is the name of one of the periodic winds that sweep over the southern part of the continent of Asia, and especially over India and Burma; and which is the cause of the well-marked rainy season in the latter countries. The coming of the monsoon is looked forward to by both the European and native communities of India with great interest, as it brings about a very agreeable change of climate, and also it brings the rain, without which the land would be very nearly barren. Unless one has been in India, it is difficult to realise the great change that takes place in the appearance of the country when the rains have set in from what it had been before. Gradually, from the end of March the heat has been increasing, and not a vestige of cloud has been seen; and as April advances, a hot westerly wind has begun to blow, and the air gets drier and drier, until all vegetation seems parched and dead. Fortunately, the hot wind generally ceases at sun-

set, and some relief is obtained, but not much; for the soil, the roads, and buildings give out the heat they have absorbed during the day, so that the air is still being heated, although to a less extent; and the thermometer in the shade may sink from one hundred and upwards to ninety-five degrees or thereabouts.

This condition of things lasts all through May and on to near the end of June, when the rains set in, and all is changed. The wind now blows from the east or south-east, and strings of clouds come with it; the temperature falls ten or fifteen degrees at least, and the air is perceptibly moist. This may last for a week or two, and the rain so much longed for holds off in the most tantalising way. At last a shower does fall, but at first it hardly suffices to moisten the thirsty land. Soon, however, the rain-bearing current gains strength, and the showers become more frequent and heavier, and water begins to flow in the drains and river-courses. The leaves of the trees get washed and look greener; and the grass begins to grow, so that the fields of baked earth become verdant and fresh. The first creatures of the animal kingdom that show renewed life are the frogs, and the ditches and ponds which were silent before are now resounding with their croaking.

The frogs are not the only creatures which the rains wake up into life. All kinds of insects make their appearance. Moths and beetles of all kinds and sizes begin to creep or fly about. At night the atmosphere seems full of insects, and the tops of some trees are rendered brilliant by the swarms of fireflies. Many of the insects are attracted by the lamps in the houses, and the table on which the lamp stands gets covered with their half-singed bodies. An insect which appears often after the first shower is the 'imago' form of the white ant. It is also much attracted towards a light, and being a four-winged insect, and the wings having a very slight attachment to the body, they readily come off, and bestrew the place underneath a lamp, while the soft greasy body of the ant creeps over the table-cover in a very helpless way. This manifestation of insect life is a very unwelcome visitant to the houses in the rainy season of India.

The rains last from the later part of June to the middle or end of September. Sometimes the showers last for three or four hours, sometimes for as many days. The writer of this paper has known the rain to fall continuously for three whole days, a great flood over a wide extent of country being the result. These floods are usually very destructive to railways, roads, buildings, as well as to trees and crops. Sometimes no rain falls for a week or ten days, giving rise to a disagreeable break, in which the clouds clear away, and the sun comes out; evaporation goes on apace with the increased temperature, so that the air is almost saturated with vapour. The climate then is very trying, and is far worse to bear than

the previous period of dry air, although then the air might be ten or fifteen degrees warmer. In fact, it is only when the showers are falling that the rainy season is enjoyable.

From a scientific point of view, the south-west monsoon and the rain it brings are easily accounted for. It is nothing else than an altered trade-wind. As is well known, the trade-winds blow from the north and south towards the equator, forming a belt of calm where they meet. On account of the rotation of the earth from west to east, these north and south currents get an easterly cast the nearer they approach the equator, so that the wind on the north becomes north-east, and that on the south becomes south-east. If the equatorial belt were always directly under the sun, these winds would remain unaltered in direction, and possibly in force also; but the earth in its circuit round the sun brings different parts of its surface directly under its rays. The extent of this ever-varying surface is measured by the northern and the southern tropic. From the 21st of March to the 21st of June it may be said that the sun is marching northwards, and with it goes the zone of greatest heat, and towards this zone the air is impelled. On June 21st the sun has reached its northern turning-point or tropic, and this tropic is nearly the latitude of Calcutta, so that the whole peninsular portion of India is now a very highly heated area, towards which the indraught from the south comes. This current in its journey sweeps over the Indian Ocean, and thus acquires much moisture. Moreover, it travels from a low to a higher latitude, and therefore from a belt of swifter to one of slower terrestrial motion. In this motion the air partakes, and with the earth it moves from west to east, so that between the two impulses it blows over India, Burma, and China, as a south-west wind. Such a wind needs only to be cooled in order to make it part with much of its moisture. A cooling agency exists in the great mountain barrier, the Himalayas, against which the wind blows. By the mountains it is tilted upwards, and so being cooled, large heavy clouds are formed, from which the rain descends with what is called tropical violence.

Strictly speaking, the monsoon is only a south-west wind along the western coasts of India and Burma. In the interior, its direction is changed by the mountain chains, and especially by the eastern part of the Himalayas, known as the Khasia Hills, by which it is made to turn almost at a right angle and blow up the valley of the Ganges and over much of continental India as a south-east wind.

At the very place where this air-current is changed in its direction, the fall of rain is possibly the greatest in the world. On the southern slope of these Eastern Himalayas is Cherapoonjee, the rainfall of which has been known to exceed six hundred inches, and it is almost always over four hundred inches. (The annual rainfall in Great Britain is on the west coast from thirty to forty-five inches, and on the east coast twenty to twenty-eight. In westerly places near high

hills it may run as much as from eighty to one hundred and fifty inches.) And this great down-pour occurs in about seven months; while in the other part of the year only a few showers fall.

From the part which the mountains play in causing the discharge of the moisture from the monsoon current, it will be readily understood that on these high hills and in their vicinity the highest rainfalls of India take place. The following figures, giving the annual falls of rain in places in Northern India, illustrate this well. Dehra has a fall of 85 to 95; Roorkee, 40 to 42; Meerut, 32 to 35; Agra, 22 to 24 inches. These four places lie almost directly north and south of each other, Dehra being close up to the Himalayas; while Agra is about one hundred miles in a straight line to the south of them. The rainfall also diminishes in a north-westerly direction, so that places in the Western Punjab have a very small rainfall: Mooltan has only about five inches; and Sind, which lies to the south of that, is very nearly rainless, and is a great sandy desert in consequence.

LOST ATLANTIS.

LOST Atlantis sleeping lies
Far away 'mid sunny skies,
And the sea is ever blue;
Naught is old, and naught is new;
All is as it wont to be
In the ages past. But we,
We have lost the path which leads
To these flower-strewn, grassy meads.
Yet at times there comes a breeze,
Spicy wind from southern seas,
Where we sailed in days of yore—
Youthful days that are no more;
And while still those breezes sigh,
Past and present, drawing nigh,
Hand in hand together stand,
And before us that lost land
Lies, as long ago it lay,
In the days when life was May.
Naught is changed, and all is there;
Voices fill the silent air.
All the friends of days gone by—
We can see them drawing nigh,
All the hopes, the joys, the fears,
Through the snows of long-past years.
We are back again once more,
With the days that went before.

But the breeze has passed away,
And no longer it is May;
Vanished all, and hushed each voice,
But our inmost hearts rejoice,
For although Atlantis lies
Hidden ever from our eyes,
Yet some day, when all is done,
And night comes, the setting sun
Will uplift the mists, and we
That old pathway then shall see—
No more Atlantis lost will be.

THE 'EISTEDDFOD.'

Their Lord they shall praise;
Their Language they shall keep;
Their land they shall lose,
Except wild Wales.

TALIESIN, A.D. 540.

WHAT the Isthmian Games were to the ancient Greek, such is the Eisteddfod to the modern Welshman. The word Eisteddfod means a sitting or a session, and it refers to the national gathering held annually in the Principality, when prizes are given to the successful competitors in poetry, music, painting, &c. It is the goal of a Cymro's ambition to carry off a prize at this institution; and the winner of the chair for the chief bardic competition is looked upon by his fellow-countrymen as very little lower, if any, than a Senior Wrangler or a Senior Classic.

Time was when the English press found in the Eisteddfod only a subject for ridicule, and sneered at Taffy's enthusiasm over this old-fashioned institution; but times are changed, and opinions altered for the better. Now the Eisteddfod receives a fair meed of praise even from the London dailies; and the illustrated weeklies do not think it derogatory on their part to give it more than a passing notice, both by pen and pencil.

It is difficult to over-estimate what Wales owes to this time-honoured institution, especially in the past, when the Welshman's opportunities of obtaining knowledge were but few, and when Universities, Grammar and Elementary Schools, were either not known, or very rarely met with in the Principality. Then the Eisteddfod was the foster-mother of literature and the nurse of the fine arts. We may well call it a Perambulating University, at which many a promising youth graduated. Many who afterwards became noted scholars and eminent in the pulpit and at the bar, would have been otherwise lost to their country simply from lack of opportunity of awakening and afterwards nourishing the genius lying dormant; in many an instance the Eisteddfod brought the flower to the sun, and placed

it in a soil where it could flourish. Listen to an authority upon this subject: 'The Eisteddfod has been the means of bringing into public notice almost all the poets, literary men, and musicians of Wales, and has been of great service in furthering native talent and fostering the latent genius of the Welsh people.'

This institution serves another useful purpose. It is a common platform on which Churchman and Nonconformist, Conservative and Liberal, can meet on equal and friendly terms to discuss those measures and subjects which are of equal interest to all classes. This binds heart to heart, by reminding the Welshman that the points on which he and his fellow-men differ are after all fewer in number than those upon which they agree.

Again, the Welsh love their Queen, seeing that she is deserving of their love, and more especially on account of her being a descendant of a Welsh Prince, Owen Tudor. If Welshmen were to be deprived of their language—and it is one of the duties of the Eisteddfod to prevent this—then one principle of their loyalty would be done away with.

As already stated, the national Eisteddfod is held annually. North and South Wales claim it alternately. Twice it has been allowed to migrate over the borders—once to Liverpool, a city which has been well called the capital of Wales, from the great number of Welsh people living there; and once to London, in the year of Her Majesty's Jubilee. There is evinced annually a healthy rivalry between the towns for the honour of having the Eisteddfod for the following year. Now, this is very praiseworthy; for to the locality in which it is held, it means much labour, and no mean expenditure of time and money, to bring it to a successful issue. The Eisteddfod is solemnly proclaimed twelve months beforehand, when a Gorsedd is held—that is, a Congress of Bards around a stone circle, and the following prayer, in the vernacular, is offered to the Deity:

God, impart Thy strength;
And in that strength, reason;

And in reason, knowledge;
 And in knowledge, justice;
 And in justice, the love of it;
 And in that love, the love of everything;
 And in the love of everything, the love of God!
 O Jesu, repress injustice!

The time of meeting is in the autumn, and the festival lasts four days. When the long-expected time has come, the collier, quarryman, and labourer deck themselves in their gayest and best, and, accompanied by sweethearts and wives, betake themselves to the 'Steddfof. An enormous marquee, embellished with patriotic mottoes, and capable of containing several thousands, served for a meeting-place; but of late years a weather-proof structure, built with due regard to comfort and acoustic properties, has come into fashion. The Carnarvon Committee erected a permanent Hall, which is used for concerts, lectures, and political meetings. Before proceeding to the pavilion, a muster of Committee, Bards, and spectators takes place, when the following proclamation in Welsh is read by the Archdruid:

THE TRUTH AGAINST THE WORLD.

In the year —, the sun approaching the autumnal equinox, at the hour of noon, on the —th day of —, after a due proclamation of a year and a day, this Gorsedd is opened in the town of —, with an invitation to all who may come, where no weapon is naked against them, and judgment will be given upon all works of Cymric genius submitted for adjudication, in the eye of the sun and in the face of the light.

Each day has its chairman and conductor. The former has little to do; but much depends upon the latter. He must be endowed with ready wit and ability to keep up the interest of the vast audience through a four or five hours' sitting. The late Mynyddog was renowned as a conductor; he was always pressed into the service, and never failed to keep the audience in good spirits from first to last. Estyn and Glanffrw were also great favourites. Of living conductors, Pedr Mostyn is deservedly popular.

The Bards are to the fore, conspicuous by the medals with which they are adorned—trophies of former victories. Each poet, when he graduates, adopts a *nom-de-plume*, by which he is ever afterwards known. This name has generally some reference to his birthplace or his then abiding-place, as Tudno and Mwrog (the Loyal Welsh Poet), from the patron saints of Llandudno and Llanfwrog respectively; or to some characteristic of his person, as Bardd Coch, the Red Bard. One young man rejoiced in the name of Echrysguthrawgollwch! The meeting always begins with poetical addresses by the Bards.

One very curious and unique custom which still prevails is the ancient manner of singing 'Pennillion' with the harp. The 'Pennillion' or epigrammatical stanzas may be counted by hundreds in the Welsh language; and a skilful singer has his memory well stored with them, and has acquired the art of singing irregular verses of different metres and length to the same tune. The harpist plays over the tune, and the vocalist sings as suits his fancy; beginning with the third, fourth, fifth, or even with the last bar of the tune; and while the harpist gives way to his imagination in different forms of variation of the tune, the singer takes care to keep in correct harmony, and ends exactly with the last

note of the melody. This is the crowning point, and all ears are open to discover a trip or a flaw in this particular.

The two great features of the Eisteddfod which are most anxiously awaited are the Choral Singing Competition on the second day, and the Bardic Competition for the Chair on the third. A substantial prize is offered for the Choral Singing, generally two hundred pounds and a gold medal for the leader. The Penrhyn Choir, under the baton of Dr Rogers, organist of Bangor Cathedral, carried off the prize two years in succession; and the third year it divided the honour with a Huddersfield choir.

The climax, however, is reached on the third, or, as it is called, the Chair Day. Every available seat is occupied; the vast assembly showing the keenest interest in the proceedings; and great are the speculations as to the successful competitor. The prize consists of an elaborately carved oak chair, a gold medal, and a substantial sum of money. The subjects for competition are taken from various sources—biblical, historical, metaphysical, &c. The following have been given: The Creation, the Flood, Belshazzar's Feast, the Resurrection, Landing of the Romans in Britain, Battle of Bosworth Field, Victoria, Charity, and Providence. The composition takes the form of an Awl or ode, which is the most elaborate form of Welsh poetry. It is composed of twenty-four different metres, and about a thousand lines in length. Three veteran bards are chosen to sit in judgment upon the compositions. Now the stillness of death prevails, for one of the three adjudicators has risen to deliver the verdict. The criticism is most thorough; every blemish is pointed out. False quantities, hackneyed expressions, second-hand versifications, obsolete terms, metrical imperfections, and impropriety of terms, are unsparingly exposed. On the other hand, the beauties and perfections are held up for public admiration, and generally the adjudication closes with a peroration such as the following: 'The glowing softness of expression, the graphic elegance of language, the flowing smoothness of versification, the exquisite train of living imagery, and the refined delicacy of taste, displayed in this Awl, combine, in our humble but honest opinion, to claim for the Author the distinguished honour of sitting in the Bardic Chair.'

The successful competitor is then invited by the conductor to come upon the platform. Now expectation is on tiptoe; and after a few minutes of intense silence, a solitary figure rises from among the vast concourse and makes his way towards the platform. He is instantly recognised; and the assembly gives vent to its pent-up feelings in bursts of loud applause. The victor is met by the Bards, and conducted towards the chair amid the strains of *See the conquering Hero comes*; the sword is unsheathed, and thrice is asked the question, 'Is there peace?' and when an affirmative answer has been given, the sword is again sheathed, and the hero is installed in the seat of honour amidst the poetical congratulations of his peers. This seat he occupies during the remainder of the meeting.

It not unfrequently happens that the judges withhold the prize for lack of merit in the compositions. A very melancholy incident happened at the Wrexham Eisteddfod in 1876. When the

successful competitor's name was called out, it was found that the poor fellow had died several weeks previously, and the chair was immediately draped in black.

During the day, subsidiary meetings are held for examining candidates for the degrees of Ovates and Bards, and for discussing matters affecting Cambria's weal or woe, as Intermediate Education, and the Utilisation of the Welsh Language in Elementary Schools. The evening meeting takes the form of a grand concert.

The Prince of Wales honoured with his presence the Eisteddfod held in the Albert Hall, London, 1887; and Her Majesty the Queen, then Princess Victoria, was present at Beaumaris Eisteddfod in 1832.

We have endeavoured to describe the Welshman's holiday *par excellence*, and we venture to think that, in point of morality, it will bear favourable comparison with the Italian's Carnival, the Spaniard's bull-fight, and the Englishman's Derby Day.

DUMARESQ'S DAUGHTER.

CHAPTER XXXVII.—FROM CINCINNATI.

MEANWHILE, Cyrus and Geraldine Maitland were sitting out with half-a-dozen others around the tennis court in the valley, all unconscious of the tragedy that was taking place within, so close to where they sat, in Psyche's bedroom. They had played a sett on the ground themselves, and fearing to monopolise the court too long, were now looking on and criticising their four successors, or indulging in the cheap recreation, so popular at health-resorts, of grumbling freely at all their friends and acquaintances. Presently, the talk turned, as it was apt to do, upon poor Psyche and her chances of recovery. 'Do you think she'll ever get well?' Geraldine asked anxiously, for the fiftieth time during the last fortnight.

'Oh, she's all right,' Cyrus answered offhand, with the easy and unthinking optimism of his countrymen. 'Give her time, and she'll come round right so: in my opinion, it's quite a circumstance. I presume she'll worry over it for a month or two more—women do feel bad about such things, I know—but then she'll get better. In our country, we see a lot of these nervous women, and we don't trouble much about 'em, even when they're high-toned. They often seem real sick for a time; but they hang on to life in the long run, by the skin of their teeth, more than the most of folks.'

'I wonder if *she* will,' Geraldine sighed reflectively. 'I hardly believe it. It makes me awfully depressed at times to see her so miserable. Do you know, Mr Vanrenen, I'd do a great deal, if only I could, to help her.'

'Why, so'd I, you bet,' Cyrus responded, open-eyed, with naïve surprise that anybody should think such a truism worth uttering. 'I'd be real pleased, you may put your money on it, if I could do anything to be any sort of use to her. But drug stores ain't much good for a case like hers. Time's the only Soothing Syrup that'll suit her malady. And I guess it'll bring her round all right in the end. You see, she's

one of these high-toned girls that take things to heart a good deal just at first more than most other folks.'

'I don't believe anything'll ever do *her* any good, unless that Mr Linnell of hers were to turn up again,' Geraldine answered suddenly. 'She never thinks of anything else, I'm sure. She fancies she sent him off to his death; and it preys upon her spirits, and she won't be comforted.'

'Do you think he ever *will* turn up?' Cyrus asked, describing a circle on the ground with his light cane. 'I don't. Sirena told me all about it that day when we came along up from the city with Miss Dumaresq. She told me all you said to her on the subject. And I wouldn't like to lay ten dollars myself on the gentleman's life. They were all cut off, you know—or almost all—by the Mahdi's niggers.'

'I can't make my mind up,' Geraldine replied slowly, looking down at the path. 'Sometimes I think there's a chance of it still—you see, he knew Arabic so awfully well—and sometimes I think the wish alone was father to the thought, Mr Vanrenen. But I hope even now; and so I'm pretty sure does Psyche.'

But poor Psyche was that very moment absorbed in her own room by that despairing vision of Linnell lying dead in a pool of his blood on the sands of the desert.

'If he does,' Cyrus remarked with a quiet sigh, 'it'll be pretty awkward for me, that's just about all. I'd better go back, right away, to Amurrica.'

'Are you so *very* much in love with her?' Geraldine asked, with a frankness equalling his own—that you must go back to *Amurrica* if she won't have you?'

'I guess so,' the young Westerner answered without a moment's hesitation. 'I always do like these high-toned English girls, you know, Miss Maitland. I liked you first, because you were so high-toned; I was death on *you*, as long as I thought I'd got a ghost of a chance; and when you wouldn't as much as look at me, and I saw it was no use fooling around any longer—why, by Sirena's advice, I caught on elsewhere, and transferred my affections, intact, to Miss Dumaresq. She's a girl any man might be real proud to marry, that one. And then, you see, her father's quite a prominent author.'

'Well, which did you like best?' Geraldine asked with a dash, turning round upon him so quickly with that strange question that he almost jumped away from her. Could she be piqued at his 'transferring' his affections, he wondered?

'Why,' he answered deliberately after a moment's pause, for he was a truthful and honest, if somewhat inept young man, 'that's not a question I feel prepared to meet in either direction right away, Miss Maitland. I don't seem to hook on to it as quick as I might. It kind of beats me. One way, I don't believe in a man crying for the moon; but then, if I was offered the moon at a gift, and no mistake, I might perhaps be inclined to reopen the subject. However, what I say now is, without any comparisons (which are always odious, the copy-book tells us), she's a fine high-toned girl, this Miss Dumaresq, and I do admire at her.'

As they spoke, a little French telegraph boy appeared at the gate, and was walking up to the house in a leisurely way with a blue scrap of the well-known flimsy official paper carelessly dangled between his thumb and finger. Cyrus looked up and beckoned the lad to come over. 'It's a cablegram for me, I guess,' he said with languid interest. 'Things in Cincinnati ain't been going as smooth as papier-mâché wheels on steel rails lately. *Tenez, mon ami.* Just you hand that telegram right over to me, here, will you? "Vanrenen, Orangers;" that's me, I reckon. *C'est pour moi, monsieur.*—Excuse my looking at it right away, Miss Maitland.'

He tore the envelope open, and read it with a stare. His face grew pale. Then he whistled to himself a long low whistle. 'Well,' he said, looking hard at it and pulling himself together with an evident effort, 'that's plain enough, anyhow. No fooling around after phrases there. This won't be cured inside of four weeks, I guess. It'll take a year or two to pile that small lot up again.'

He spoke to himself, meditatively and absorbedly; but Geraldine gathered, from his sudden paleness and his vacant gaze at the flimsy blue paper he held before him, that some real calamity had fallen upon him all unawares. 'Nothing wrong in *Amurrica*, I hope?' she interposed interrogatively.

'Well, it ain't exactly right, anyway,' Cyrus answered with a quaint reserve in his measured tone. Your American rarely admits himself beaten. 'It's a little askew, I admit: gone wrong somewhere.—Just you read that, Miss Maitland. You'll see what it indicates. It's from my partner in Cincinnati, in charge of our business.'

Geraldine took the telegram in her own hands, and read in a bewildered half-conscious way: 'Fifth National Bank suspended payment yesterday. Pork Trust burst up. Firm stone broke. Will cable particulars as soon as I know extent of our losses. Am meeting creditors to-day for first arrangement. Assets nil.—ESELSTEIN.'

'What does it mean?' the English girl asked, with a vague sense of chilly apprehension stealing over her suddenly, though the words in which the message was couched were pure Greek to her.

'Well, it means—ruin,' the American answered with quick returning cheerfulness, continuing to draw circles with his stick on the gravel carelessly.

'Ruin!' Geraldine echoed, drawing back with a start.

'Yes, there or thereabouts,' Cyrus replied with something like a smile of amusement at her incredulous stare. 'R-U-I-N, I've always been given to understand, spells Ruin. That's how I read it. Vanrenen and Eselstein's the name of our firm. We went it blind on the Fifth National Bank, which was largely interested in the Cincinnati Pork Trust. Now the trust's burst, and the firm's ruined. Fact is, we put on our bottom dollar. I'm real sorry, and no mistake, for it's an awkward event. It don't so much matter for me, of course; or even for the girls. I can go back, and begin fresh; and a year or two'll pile up that lot again, I reckon. But it's rough on Eselstein, I don't deny. He's an elderly citizen,

Eselstein, and he's got a rising family of his own to look after. His eldest son's just graduated at Columbia College, and was going into pork on his own account next fall, if this awkward affair hadn't intervened to stop him.'

'But you haven't lost *everything*!' Geraldine cried, astonished.

'I guess that's just about the name of it,' Cyrus answered coolly, completing his pattern on the gravel path. 'Perhaps things mayn't be as bad as the old man thinks; and perhaps they may: but if they are, why, we've got to face 'em, like all the others. I'm not the only man, by a long shot, stone broke to-day in Cincinnati, anyway.'

They paused for a moment; and Cyrus, a little more discomposed now, crumpled the telegram nervously in his trembling fingers. Then he said with a jerk: 'It's lucky, as it happens, Miss Dumaresq hadn't—acceded to my wishes before this thing turned up. I'm glad for her sake it had gone no further. It might have made her father feel quite uncomfortable if she'd accepted a man who, as it turns out, wasn't worth the paper he was written on.'

Geraldine looked up at him with undisguised admiration. 'Very few men,' she said, with a burst of spontaneity, 'would have thought of that at such a moment, Mr Vanrenen.'

'No, wouldn't they, though?' the Westerner answered with a naive surprise. 'Well, now, it just seemed to me about the most natural idee a man could hit upon.'

'There is an answer, monsieur?' the French boy asked, standing by all this time, bareheaded and expectant.

'Well, no,' Cyrus replied in English, putting his hand inquiringly into his waistcoat pocket. 'There ain't no answer possible, thank you, mister, as far as I'm aware—but there's a franc for you.'

At that moment, Sirena, white with awe from the scene she had just been witnessing in Psyche's room, rushed out to join them. 'Cyrus,' she cried, in a fever of excitement, 'that poor girl's in a terrible state of mind. Corona and you have got to go right away this minute to Biskra.'

'Biskra!' Cyrus answered in blank surprise. 'Biskra! Why, what's the trouble? That's away off in the desert, isn't it?'

'I know it is,' Sirena answered hastily. 'But, desert or no desert, you've got to go there. Just look at this paper!' And then in brief and very hurried words she told them the story of poor Psyche's shock and her present condition.

Cyrus's face was all aglow in a moment with horror and sympathy. He forgot his own troubles at once in listening to Psyche's. Geraldine couldn't help noticing that this strain on somebody else's hopes and affections seemed to strike the simple-hearted fellow far more profoundly than the crushing news of his own altered fortunes. He listened with evident distress and alarm. Then he said quickly: 'When does the morning train for Constantine start to-morrow?'

'I've looked it up,' Sirena answered, all aglow with the crisis. 'It starts early—quite a Western hour—five-thirty A.M. But you've got to catch it.'

'Will Corona hook on?' Cyrus asked without a single second's hesitation.

'Yes. She wants to help all she can in this terrible business.'

'Very well,' Cyrus answered, moving towards the house. 'I'm ready to start. I can go right off. We've got to see this thing straight through to the bitter end, and the sooner we set about it now, the better.'

'And suppose you find him?' Geraldine suggested with a whitening cheek.

'Well, suppose we find him,' Cyrus said decisively, 'I reckon this girl's got to marry him, Miss Maitland.'

'I hope you will,' Geraldine cried with fervour.

'I hope so too—for her sake.—Oh, say, Sirena; here's a telegram the old man's sent me from Cincinnati. Make your mind up for bad news from home, my dear. It ain't a pleasant one.'

Sirena took it and glanced over it rapidly. 'Well, I presume,' she said with perfect soberness after she'd chewed and digested the whole contents, 'this means we must go back, first mail, to Ohio?'

'It does so,' her brother answered with dogged good-humour. 'It means we've got to begin life over again, and you won't get your portrait done at all now with Vesuvius in the background.'

'I don't care a red cent about Vesuvius,' Sirena replied, flushing, as she tore up the telegram into a hundred shreds, and scattered its fragments on the breeze among the aloes and cactuses. 'But what I *do* feel is this—I would like to stop along and help Psyche.'

'So you can,' Cyrus answered with promptitude, reckoning up internally. 'I guess I can raise enough for that, anyway.—But all this is neither here nor there just now. The business before the meeting at the present moment is to get started off straight ahead to Biskra.'

Sirena nodded. 'That's so,' she said, and walked back slowly and soberly toward the house.

Cyrus turned and raised his hat respectfully to Geraldine. 'Good-bye, Miss Maitland,' he said with a pleasant smile. 'Excuse my going off to get my baggage ready.'

Geraldine looked after him with a regretful look. 'Mr Vanrenen,' she cried in a tone of deep conviction, 'this is positively nothing short of heroic.'

The young American turned towards her a puzzled face. 'Which?' he asked, gazing around in a vague inquiring fashion for the invisible hero.

'Why, the way you all take this blow,' Geraldine answered, quite fervid, growing flushed in the face herself at her own audacity, but seizing both his hands in hers as she spoke; 'and the way you all think so little of yourselves, and so much about this terrible misfortune of poor Psyche's. You're dear good people, every one of you, I declare. I love you all for it. I never saw people behave so in my life before. As long as I live, I promise you, Mr Vanrenen, I'll never, never, never make fun of you again, you dear good souls, for saying *Amurrica*.'

'No? Won't you, though?' Cyrus cried, holding her hand in his for a second with a faint pressure.

'No, I won't,' Geraldine answered very decisively. 'I like you so much! I think it's so

grand of you! I call you a brick! And I hope you'll find this lover of Psyche's!'

Cyrus raised his hat once more, one schoolboy blush from chin to forehead, and strolled away to the door, a ruined man, reflecting to himself as he went—that Geraldine Maitland was really after all a most extremely high-toned young lady.

GLASS IN ANCIENT EGYPT.

It was customary at one time to aver that the ancient Egyptians were, at all events until a very late date in their history, ignorant of glass and its uses. This statement—based upon ignorance of their social condition, an ignorance quite universal until the researches of Rosellini, Wilkinson, and others at Thebes and elsewhere, threw a welcome flood of light upon the question—has now been completely disproved; for the researches referred to have shown that glass and porcelain, of a quality equal to that of modern times, were manufactured and used extensively in Egypt under the fifth dynasty, or nearly four thousand years B.C.

The glass-blowers of Thebes were as great proficient in their art as, possibly greater than, we are after the lapse of nearly forty centuries of progress and retrogression. They possessed the art of staining glass, and they produced this commodity in the utmost profusion. Rosellini gives an illustration of a piece of stained glass of considerable taste of design and beauty of colour, in which the colour is struck through the whole vitrified structure; and there are instances of the design being equally struck through pieces of glass half an inch thick, perfectly incorporated with the structure, and appearing the same on both the obverse and the reverse side.

The priests of P'tah at Memphis were great glass-makers, and, says one authority, 'not only had factories for common glass, but, profiting by their discovery of the property of oxides of metals, which they got from India, of vitrifying different colours, conceived the project of imitating all the precious stones which commerce brought them from that country.'

They were favoured by nature, moreover, in having at hand an unlimited supply of pure sand and kali; and their glass derived its good quality as well from these substances as from the further fact that in its preparation they utilised the ashes of a peculiar genus of kelp that grew in abundance by the Lake Mareotis and the Red Sea. They imitated amethysts and other precious stones with wonderful dexterity; and besides the art of staining glass, they must have been aware of the use of the diamond in cutting it and engraving it. For in the British Museum there is a piece of exquisitely stained glass, of the time of Thothmos III. (*circa* 1500 B.C.), skilfully engraved with that monarch's emblazonment by the hand of a master.

The priests were to the people of early Egypt

pretty much what monks like Roger Bacon were to the early middle ages—they were the great scholars and exemplars of the learning of their day, and held the keys of all the arts then known. But they differed from the monks in this, that whereas the latter imparted their knowledge only to a few, the others taught it broadcast and let the people benefit by it. How they discovered the art is a matter concerning which nothing can be gathered, probably because the discovery went too far back in the national history. They themselves averred that the great god Ptah, whose servants they were, and who invented the universe, had taught them the art; but this is only tradition, and in conformity with a habit men have of ascribing simple luxuries to the direct mediation of the gods.

Pliny's tale about the Phœnician merchants returning from Egypt to Syria with *natron* or soda, and accidentally discovering its properties when cooking on the sandy beach near Mount Carmel, is also a tradition; and even if it has a basis in fact, it is more probable, as Sir H. Rawlinson suggests, that such an accident would occur in Egypt, in many parts of which the soil contains abundance of *natron* as well as of sand. However they learned the art—whether by their own unaided efforts or through the Phœnicians—they quickly adopted it, and improved upon the rough beginning. They had great glass factories at the very gates of the lakes of nitre, in the midst of the desert, where their ruins are yet to be seen. It is probable that the treasures discovered in the tombs at Memphis came from these factories; certainly, these were what we may call the national establishments, the profits of which went to the reigning king; and on the south side of the *mastaba* of Tih, dating from the fifth dynasty, the whole process of the manufacture is set forth unmistakably in pictorial and sculptured representations, side by side with the whole art of carpentry, masonry, chair-making, &c.

'That the Egyptians were acquainted with the art of making vitreous glaze even before this,' says Mr Dunlop, 'is proved by the convex pieces of glazed green pottery inlaid with stucco in a kind of mosaic in two chambers at the Step Pyramid of Sakkara,' which dates from the first or second dynasty. That glass was turned out of the factories in large quantities is easily proved. Fragments of granite have been found which are covered with a coating of stained glass, and through which the hieroglyphics of the stone appear; and we know from examples unearthed, and from the very useful tableaux alluded to, that it was employed for every-day purposes. The costly stained varieties were also produced 'in the greatest profusion.' They have been found in every part of the land, and numerous specimens are to be seen in every museum of Europe. Among these are false emeralds, in which they seem to have succeeded best.

There is little doubt, also, that many of the

large emerald basins used in the early Christian churches were of their manufacture. Diodorus Siculus says the coffins were commonly made of the same substance in Ethiopia; and another good proof of its prevalence may be found in Pliny's statement that in the temple of Jupiter Ammon there was an obelisk of emerald—that is, of glass in imitation of emerald—sixty feet in height. The green hue, we may state, appears to have been imparted by oxide of copper; and the red used in imitation of rubies, or in staining plate-glass, was minium.

Glass bottles nearly similar to our wine bottles in colour and measure, though in shape resembling the wide-mouthed kinds used in preserving fruit, may be seen in the British Museum, and are found in abundance in other public and private European cabinets. Apropos of bottles, we may mention a curious fact illustrative of the tenacity of ancient custom, especially in 'the changeless East.' The Florence oil-flasks, and the turpentine carboys from Cyprus and the adjacent shores, are exactly the same in size and shape as these bottles of the ancient Egyptians. The likeness holds even to the matting used for the protection of both.

Sir J. G. Wilkinson, whose *Manners and Customs of the Ancient Egyptians* is so invaluable to the student, although his obligations to Rosellini are great, thinks that glass lanterns were used by soldiers, and gives a specimen of a group of Egyptian sentinels carrying a lantern upon a curved pole. It is not improbable, again, that a hieroglyphic on the Rosetta Stone, used for *manifestation*, and resembling a magic lantern with a handle, from which rays of light are seen issuing, was also made with glass; and on the other hand, it is probable that the lamps employed for yearly illumination at the Saïte festival were of this transparent material. That it was used for windows there is no saying: the temperature of the country during the whole twelve months is extraordinarily mild, and the necessity for keeping out the cold does not therefore exist. In nearly all other daily concerns, however, it was undoubtedly employed.

The mode of manufacture was then much as it is now; the blowpipe, shod with iron, and heated red-hot, was inserted into the melted glass. In the pictures of the ancient manufactories men are to be seen bringing the 'fret' (a combination of kali, from the ashes of the *Dalsola communis*, or kelp, and a particular kind of fine sand) in baskets for the purpose of vitrification.

As for the chemical knowledge displayed, it is remarkable. Take a single instance—a piece of stained glass found at Thebes, and now in the British Museum. The design is tasteful, consisting of a quadruple star with foliage in the angles. Blue, green, and yellow colours are introduced, and they are struck through the glass. To produce this effect of glass-staining, oxides of cobalt, or of calcined copper and zinc, must have been used for blue, oxide of silver for yellow, and oxide of copper for green. Some of the

fictional gems they made of glass exhibit the ruby colour which we have lost the means of making; and that scarce and rich purple tint which can only be given by oxide of gold.

THE HEIR OF ROTHWELL CHASE.

CHAPTER IV.

PRESENTLY, Vodney drew the woman's arm within his own, and together they began to pace the farther end of the glade. Taking one thing with another, the affair seemed to Evan so strange and suspicious that he would have felt no scruple about listening to their conversation had he been near enough to do so. As it was, beyond a word now and again, he could make out nothing of what they said to each other, the only thing evident to him being that their conversation was carried on in French. So full and clear was the moonlight by this time, that any attempt on his part to lessen the distance between himself and them would have been to court inevitable discovery. All he could do was to bide where he was and watch the progress of events.

At the end of ten minutes or so, during which the talk between the two had not ceased for a moment, Vodney again embraced the woman, after which they at once parted, he returning by the way he had come and again passing close to the fountain, and she disappearing in the opposite direction. After this there was nothing left for Evan save to make his way back to Berriefield at his leisure. It need scarcely be said with what eagerness he looked forward to his next meeting with Edeline.

'From what you tell me, the woman you saw can have been no other than Therese Cobran, Mrs Marchmont's maid, who is, I believe, a Swiss by birth.' So spoke Edeline next afternoon after her lover had described to her the singular interview of which he had been an involuntary witness. 'And, besides, the time coincides exactly with that which Therese is allowed to devote to her own purposes. Our dinner-hour is half-past six; and after Therese has attended to her mistress's toilet, she has a clear hour to herself, which she can spend either indoors or out, as may suit her best. But with what object she should meet Mr Vodney by appointment in the Chestnut Walk, and how it happens that they should be on such excellent terms with each other, as, according to your account, they seem to be, is as much a puzzle to me as to yourself.'

'A puzzle to which there must be a solution somewhere,' said Evan, 'if one only knew how and where to set about looking for it.'

When, later on, Evan came to turn the affair over in his mind, he quickly decided that he would use his best endeavours to be present at the next interview between Vodney and Therese, which would be nearly sure to take place, as before, in the Chestnut Walk, when chance or opportunity might put into his hands some clue,

which, if carefully followed up, might lead him onward no one could foretell whither.

Therese was not at liberty till half-past six, Edie had told him; and at that hour to the minute Evan took up his position by the fountain on the following evening. After waiting till eight o'clock without the solitude of the Walk having been broken by voice or footstep, he went his way, having gained nothing but a lesson in patience for his pains. A similar result awaited him next evening; but on the third evening his perseverance was rewarded.

In the meantime, Edeline had informed him that Vodney had again been up to the Chase, and had for the second time assured Sir Harry that he held in his hands a clue, as to the nature of which he was not at liberty to say more just then, but which, in the course of three or four days at the most, would enable him to lay his hand on the child at an hour's notice. That the child was alive and well he was in a position to assure Sir Harry; it was, however, essential to the success of his scheme that no precipitate steps should be taken in the matter, but that it should be left entirely for him, Vodney, to work out in his own way.

What he was thus told merely served to deepen Evan's bewilderment, seeing that nearly the whole of Vodney's spare hours were still given over to billiards. More than once he said to himself: 'Can it be possible that Vodney has by some means discovered that Therese is privy to the abduction, and that, under the pretence of making love to her, he is endeavouring to worm out of her the secret of the child's whereabouts?' If such were the case, it would serve to explain Vodney's apparent inaction in the affair: till he should have succeeded in making himself master of Therese's secret there was nothing for him to do. It was a theory which would serve to account for much; but it afforded no answer to the question, For what purpose had Vodney imposed upon Sir Harry with a false address—an address, too, which had not merely been written, but printed on the card sent in to the baronet?

Such were some of the perplexing problems which Evan kept revolving in his mind as he stood waiting this evening by the fountain. Not many minutes had he been there, before, as on the previous occasion, he saw the figure of a woman emerge from the trees at the farther end of the glade and advance a little way into the moonlight. Evan's heart began to pulsate at express speed as he recognised the woman for Therese. The wish which possessed him most at that moment was, that after Vodney should have joined her, as he doubtless would in the course of a few minutes, in their pacing together to and fro they might come sufficiently near his hiding-place to allow of his overhearing a portion at least of the conversation between them.

Therese, still keeping to the lower end of the glade, began to walk slowly up and down, turning and retracing her steps every dozen yards or so. It seemed to Evan that he could detect an air of expectancy in her attitude, and moment

by moment he looked to see Vodney come brushing through the trees into the moon-lighted Walk. His nerves pricked and tingled; all other senses seemed merged in those of seeing and hearing.

Ah! here was Vodney at last. But this time he entered the glade at the other end, by the same path which had brought Therese. As before, the first thing he did was to embrace her. Then, with his right arm passed round her waist and her left hand held in his, they came slowly in the direction of the fountain, talking earnestly meanwhile. Evan drew back a pace or two and, scarcely breathing, waited.

But what was this which all but forced an exclamation from his lips? The man who had just kissed Therese and was now walking by her side in most affectionate guise, was not Vodney, but a stranger! Hardly could Evan believe that his eyes were not playing him false. He stared as he might have done had an apparition suddenly appeared before him. But any lingering doubts he might have had were dispelled a moment later when the stranger's voice fell on his ears. It was a voice of an altogether different *timbre* from that of Vodney, provincial in some of its accents, and with a slight lisp, evidently not affected, but natural.

But hush! What was it he was saying to Therese?

'I tell you again, dearie, as I've told you before, that I can't keep the old man quiet much longer. He growls like a bear with a sore head—wants to know when the affair's coming to an end, and says that if the twenty pounds, as promised, isn't paid within'—

'You shall have the money to-morrow without fail,' broke in Therese. 'And as for the rest, he must have patience for a few more days—only a few more days, tell him.'

'All right, darling. The twenty pounds will stop his mouth for a while, never fear. He's an awfully mean old cuss, and would sell his soul for gold, if he could get anybody to buy it. But not a word more about him! Let us talk about ourselves and our plans.'

After coming nearly as far as the fountain, they had turned, and were now going back; and from this point they passed out of earshot of Evan, their voices reaching him merely as inarticulate murmurs.

A few minutes later brought the interview to a close. They parted on the same affectionate terms as they had met. Therese went first. As soon as she was gone, the man struck a match and lighted his pipe; and then, after smoking for some minutes with his hands in his pockets and his back resting against a tree, he, too, took his departure and by the same way.

Then Evan emerged into the moonlight and drew a deep breath.

That Therese, for some purpose of her own, was playing a double game could not be doubted. She was allowing two men to make love to her, and it was scarcely conceivable that either of them was doing so with the knowledge or connivance of the other. But then came the question: Who was this other man? Was he Therese's real lover, and was he being hoodwinked by her? Or was he playing knowingly into her hands? And then again: Who was the 'old man' of whom

he had made mention, and for what purpose was it essential that Therese should find the sum of twenty pounds? Was the outcome of the plot, of which there was little doubt that Therese was the leading spirit, to be sought in this fresh direction rather than through the medium of Vodney, who, it might be, was being quietly fooled and led on by Therese, while in reality she was working out her ends in her own way and without the slightest reference to him at all?

It was with even more than his usual longing for the time to pass quickly that Evan awaited his next day's interview with Edeline. His hope was that she would be able to enlighten him as to the personality of Therese's sweetheart number two. Nor was he disappointed.

'The person as you describe him,' said Edeline, 'with his slight lisp and his velveteen shooting-coat and low-crowned hat, can be none other than Tom Abrey, your uncle's favourite groom. But to think that he should be making love to Therese!—and oh, to think of Therese allowing herself to be made love to by *two* men, and she so quiet and unassuming, never mixing with the other servants, but keeping herself to herself! It's—it's positively dreadful.'

'What do you know of this Tom Abrey?' asked Evan, for whom an analysis of Therese's moral qualities had no interest.

'Very little, although it is he who attends me when I go out riding. He is always very respectful, and never presumes in any way.' Then, with a demure smile, she added: 'I believe he is considered to be rather good-looking, if that is a matter of any consequence to you.'

'Of not the slightest consequence,' responded Evan dryly. 'It might be more to the purpose if I knew something about his antecedents and where my uncle contrived to pick him up.'

'Oh, my dear, he's a native of these parts. His grandfather, Sampson Abrey, who is said to have been one of the most notorious poachers in the county years ago, lives at Marshmallow Cottage, between two and three miles away; but whether Tom was brought up there I am unable to say. He entered your uncle's service when a youth, and while I was still at school.'

Could the grandfather in question be the 'old man' to whom the twenty pounds was to be paid, and of whom Abrey had spoken to Therese in such uncomplimentary terms? Assuming such to be the case, and bearing in mind the various items of information so strangely gleaned by him, what ought his, Evan Marchmont's, next step to be? for it was quite clear to him that there were too many suspicious features in connection with the affair to allow of his letting it rest without endeavouring to probe it to the uttermost.

After a few minutes given to silent cogitation, he said: 'As to this Marshmallow Cottage, in what direction does it lie from here?'

'It lies about half a mile inland, between the Chase and the sea, and on the high-road which runs from Wakenham to Fallowfield.—But why do you want to know about it?'

'Because in the course of to-morrow I purpose taking a stroll in the direction of it; and there are so many cross-roads in this part of the country that without proper instructions I might

easily miss finding it.—Do you happen to know anything of the family—that is, how many persons it comprises in addition to old Abrey?

'Yes; I can tell you all about them, for I make a point of calling at the cottage at least once a fortnight.' Then noting her lover's look of surprise, she added: 'The matter is very easily explained. One day when I was out riding, about a year ago, Zenobia cast a shoe, and she is so very tender-footed that I was rather put about. Abrey, who was in attendance, suggested that I should wait at his grandfather's cottage, which was close by, while he took the mare to a forge and had her re-shod. After a little demur, I agreed to his suggestion; and thus it was that I came to make the acquaintance of the inmates of Marshmallow Cottage. First, there is old Mr Abrey, whom very few people, I imagine, could persuade themselves into liking. Of him I need not say more. Then, there is his eldest daughter, a woman of forty and a widow, Mrs Rudd by name, together with her daughter Elsie, an impish girl of fifteen. Last of all there is Ann Abrey, the sister of Sampson, a woman of sixty, for whom it is impossible to help feeling a profound pity. Years ago, she had a seizure which deprived her of the faculty of speech, and at the same time took away the use of her left side. It is her whom I go to see once a fortnight, and my visits are so evidently a pleasure to her, that I cannot find in my heart to give them up, although I am quite aware that the other inmates of the cottage would prefer my room to my company. Ann sits the day through by the chimney corner in a chair which I had made specially for her. Now and then I either take or send her a few grapes or other fruit, with an occasional delicacy from the kitchen, such as I think may tempt her appetite; and when the illustrated papers are done with at the Chase, they are put aside for her. The pictures amuse her, poor dear, and help her to while away many an otherwise weary hour.'

'And when did you call at Marshmallow Cottage last?' Evan presently asked.

'Five days ago.'

'And you observed nothing out of the ordinary—everything seemed to be going on as usual?'

'Just as usual.—Oh, by the way, while I was there the postman brought a letter for Mrs Rudd. It was from her sister-in-law in London, announcing that she was dangerously ill, and begging the widow to go and stay with her till she should be better.'

'Do you happen to know whether Mrs Rudd decided to go to London?'

'I heard her tell her father that she intended to catch an early train at Berriefield on the following day.'

As Edie had said, Marshmallow Cottage stood inland about half a mile from the sea-shore. It was a low, strongly-built, two-storied house, containing six rooms in all. Its out-buildings consisted, on the one hand, of a two-stall stable and lock-up—for 'Samp' Abrey prided himself on always keeping a fast-trotting mare with a light trap to drive it in; and, on the other, of a 'fodder-shed,' as it was termed, a small, rudely-built, one-story edifice, having a signboard facing the road, on which was announced that hay and

corn were sold there. Mr Abrey dealt in a small way in those commodities, his customers being chiefly among the country carriers, 'one-horse hawkers,' and such-like, who knew that they could always get a truss of hay a penny or two-pence cheaper at the cottage than at any chandler's shop either in Berriefield or Wakenham. The cottage stood a little way aside from the high-road, backing so close up to a cliff of yellow sandstone as almost to touch it. This cliff, by the foot of which, for a distance of three miles or more, ran the road between Wakenham and Fallowfield, unlike most other cliffs, which, as a rule, show a frontage to the sea, swept gradually up from the shore till it reached its highest point half a mile inland, where it ceased abruptly with a sheer fall some fifty or sixty feet in depth. From the summit, the eye, sweeping inland, took in a wide expanse of flat country, known as the finest grazing-ground for cattle anywhere about. Geologists would tell you that this low green level—which Mr Vodney would probably have likened to an immense billiard-table—had in ages long ago been a tidal lake, communicating with the sea, but that, in the course of time, its channel had silted up, and that the slow but sure processes of Nature had gradually transformed it into what we see it to-day.

At the point where Marshmallow Cottage was built, the cliff fell back somewhat from the nearly straight line which it kept for a considerable distance on both sides, forming a small semi-circular gap in the frontage, or bay, as it would have been called had the cliff faced the sea. At the door of the cottage, about three o'clock in the afternoon of the day following that of his last interview with Edie, knocked Evan Marchmont. He was clad in a suit of rough homespun, and he looked dusty and tired. It was Samp Abrey in person who responded to his knock.

'Can you tell me how far I am from Berriefield?' asked the young man as he raised his hat for a moment, 'and which road I must take in order to get there?'

A man between sixty-five and seventy years of age, muscular and broadly built, but not tall; with a massive head, a tangle of grizzled hair, keen steel-gray eyes set about with an intricate network of wrinkles, and a rugged but powerful face, in which force and craft seemed combined in equal proportions—such was he who now confronted Evan, and after eyeing him from head to foot, gave him, in a couple of curt sentences, the information he had asked for but was not really in want of. Scarcely had Evan time to get out a word of thanks before the door was coolly shut in his face, while so effectually had the old man's burly figure blocked up the doorway, that he had been unable to obtain even a glimpse of the interior.

Leaving the cottage behind him, Evan kept on in the direction of Wakenham for upwards of a mile, till, in fact, he came to a break in the escarpment of the cliff, caused by a landslip in years gone by, up which he contrived to scramble, and so land himself on the summit. That done, he doubled back in the direction of the cottage.

He had noticed that that portion of the cliff which so closely overlooked the tiny demesne of Sampson Abrey was fringed with patches of dwarf brushwood, with a thick undergrowth of

bracken and tall weeds of various kinds, and it had struck him that here was a natural hiding-place from which, himself unseen, he could observe every one who might come or go, and all the outdoor proceedings of those below.

A short half-hour's walk along the grassy down which spread itself between the sea and the cliff, and on which the only living things beside himself were a few scattered sheep, brought Evan back to the hollow in the encircling arms of which Marshmallow Cottage was built. Stretching himself at full length on the turf, he dragged himself along, parting last year's dead bracken and undergrowth as he did so, till he found himself close to the edge of the cliff, where all he had to do was to push aside a screen of still leafless brushwood and look down. Patiently he waited without stirring for more than an hour before any sign of life beyond a thin curl of smoke from the chimney was discernible below. Then a carrier's cart crept into sight in the distance, and crawling slowly along the high-road, arrived in about ten minutes' time opposite the cottage.

'Yo-ho! House! house!' called the carrier as his horse came to a stand; and next minute Samp Abrey emerged from the cottage and proceeded to exchange greetings with the man, who was evidently an old acquaintance.

What the carrier wanted was a couple of trusses of hay, which Abrey proceeded to fetch from the forage-shed. The hay having been packed in at the back of the cart, the carrier paid Abrey for it, and the two having bidden each other good-day, the former cracked his whip, called 'Gee-up' to his horse, and went whistling on his way; while the latter, after a look up the road and down the road, went back indoors. Evan was once more left to the company of his own thoughts.

He was still lying there, debating within himself what his next move ought to be, considering first one plan and then another, but failing so far to see his way to a decision, when he was suddenly startled by hearing a low faint strain of music, but whence proceeding he was utterly at a loss to conceive. His first thought was that it must come from the interior of the cottage; but after listening breathlessly for a few seconds, he convinced himself that such was not the case. Drawing back a little way from the edge of the cliff, he half raised himself from his recumbent position and stared around in every direction; but no human being was anywhere visible. Still the strain went on—low, sweet, mysterious, while yet being compounded of only a few simple chords, as it might be an air sung in church by unskilled village folk; but all the same the question remained, how and whence did it emanate? Involuntarily, Evan cast his eyes upward, as though half expectant of being able to trace it back to some source in mid-air, only to tell himself next moment that it was no aerial strain to which he was listening, but that rather did it seem to reach him out of the bowels of the earth. And then all at once an astounding possibility flashed across his mind. Stretching himself again at full length and stopping one ear with the palm of his hand, he laid his other ear close to the ground and listened. When he lifted his head a couple of minutes later, a brightly exultant

look shone in his eyes. 'Eureka!' he cried aloud as he sprang to his feet. 'It must be so! In no other way can it be explained. To-morrow I will put it to the proof.'

AMONG THE CORFIOTES.

It is yet early in the afternoon, and since the mid-day meal the island of Corfu has been indulging in its afternoon doze, and we of the European contingent at the *Grand Hôtel de Tous les Ambassadeurs* are also lazily inclined, for a very few days have sufficed to make us slip into the lotus-eating habits of the islanders. The very air seems asleep; not a breath rustles the parched leaves of the trees that border the esplanade; and the sun has for hours been pouring down its almost vertical rays with a fierce heat like the glow from an open furnace door.

I am sitting in the closely-shaded room of a young Russian Secretary of Legation, who has lately arrived at Corfu on leave, in the hope of prolonging his life through the winter. Poor fellow! he is far gone in a consumption, and lies full length in a long chair, pale and listless, but charming and well-mannered, as the Russians of the better class know how to be when they think it well to assume their veneer of company-manners.

The room is almost dark, for the awnings are over the windows, and the Venetian blinds are lowered more than half-way down; but as I lie back lazily in my wicker armchair, I command a view of the whole of the esplanade beneath the citadel, on which our soldiers used to exercise during the British occupation. At present it is unoccupied, not even a dog venturing to cross that dry and sunburnt stretch of gravel. But gradually, as we sit and chat, the sun slopes towards the western sea, and the town of Corfu wakes up for its afternoon crawl on the parade, and for its little glass of vermouth, with which it endeavours to create an appetite for supper, beneath the awnings of its favourite cafés. Not to be outdone by the natives, we rise and join the crowd now gathering on the parade, the invalid putting on his fur coat; for, hot as it is now, the evening breeze will rise in a short time, and my poor friend fears even its pleasant and refreshing coolness. A very little walking suffices to weary him; so we join one of the groups on the chairs in front of a café, and watch the inhabitants as they walk up and down. Every one of any importance in his own eyes, or in those of other people, is here, unless he is ill or out of the island; for every tongue both male and female would at once be set wagging to account for the mysterious absence of the unhappy man, who would in five minutes lose every shred of character he had managed to retain.

They are not much to look at, these good Corfiotes, and a very little experience shows that their character is on a level with their appearance. There is one horrible little man who inspires

both the Russian and myself with a speechless disgust. He is a very short man ; so, to add to his height, he wears boots with tremendous heels, and an extremely high and narrow top hat, which renders him very conspicuous in a crowd of billy-cock wearers. For fear of concealing what legs he has, he wears a cut-away jacket ; and thus attired, he stalks along with a melodramatic scowl on his face, three paces to the right, and slightly in front of his womenkind—his mother, his wife, his sister, and sometimes his small daughter—who all accompany him with a meek and crushed air, which gives some support to the rumour that the little ruffian is in the habit of thrashing them unmercifully.

Our soldiers in the old days regarded the Corfiotes with the most sovereign contempt, and dubbed them individually and collectively, Spiros ; San Spiridione being their patron saint, and giving his name to a large proportion of the children born on the island. But the fishermen, who much resemble the Neapolitans, and the peasants from the country villages, are fine-looking fellows, though most of them have thoroughly studied the art of doing nothing gracefully, a pursuit which has been brought to perfection by the peoples of Southern Europe. At first, it is rather astonishing to hear a sunburnt, ragged, and down-at-heel ruffian addressing a brother tatterdemalion as Epaninondas, and being hailed in return as Themistocles or Pericles ; but everything must be classical nowadays in modern Greece, and the people are actually unlearning their own tongue to return to that of Xenophon, with the consequence that the old men and the young can hardly understand one another.

The two most important consulates in the island are those of England and France, though Italy and Turkey also keep consuls here, and nearly every nation under the sun that has any Mediterranean trade possesses a vice-consul. The smaller nations have appointed merchants of the town as their representatives ; and as the Greek is as fond as a Frenchman of a uniform and a bit of ribbon in his button-hole, there is a good deal of competition for these honorary appointments. That stout little man going by, who seems so well pleased with himself, is a well-to-do merchant who has somehow got appointed the consular representative of two or three insignificant South American republics which have not the slightest trade or interest in the Mediterranean beyond enabling their agent to buy himself a smart uniform at his own expense, and to inscribe on his card, 'M. OUTINIDES, Consul de Diverses Puissances.' He distributes these cards on the slightest possible provocation ; but as he is an amiable little person, few people grudge him his harmless mania.

Standing judiciously in the shade, a little apart from the stream of promenaders, is a stout and amiable gentleman in a long black clerical frock-coat, with a fez pushed rather to the back of his head, and a string of magnificent amber beads, which he runs mechanically through his fingers,

behind his back. He is the Turkish consul ; and as he is probably quite as little of a Turk, or rather quite as much of a Levantine, as any of the people around him, he has a very comfortable berth in the island. Not that the position of Turkish consul is always a bed of roses in Corfu, especially when there is some little difficulty with Turkey ; the natives are too easily excited for that.

When an outbreak of hostilities was threatened between Turkey and Greece after the late war, the unfortunate Turkish consul was placed in a very awkward predicament. Technically, he was in a friendly country, but actually he was besieged in his house by a howling mob of the worst ruffians in Corfu, among whom it was said that some of the hot-headed young bloods of the island were not ashamed to be seen. It was arranged that the consul should leave the city, as his presence only served as an excuse for mob violence ; but the poor man dared not face the crowd, and remained shut up in his house in a state of abject terror. A way out of this dead-lock was found by the English consul, who went to the Ottoman consul and persuaded that excellent but timid official to accept his escort down to the quay. The streets were crowded with ruffians ready for any crime that could be committed with impunity ; but the English consul had a contempt for the Corfiote mob, due to his many years' knowledge of it ; and so, preceded by his servant, and supporting himself on one side with his stick, and on the other by the arm of his trembling colleague, he conducted the Bey in safety to the quay, undaunted by the threats and curses levelled at him by the cowardly mob. He was an old man and infirm ; but his reputation for courage was so well known, and the name of England so powerful, that his mere presence did what a hundred policemen could hardly have done, and ensured the safe departure of the Turkish consul.

But those times have passed away, and by-gones are by-gones. Even those gallant heroes who, after joining in the attack on the Turkish consul, expatriated themselves when the government looked so far like declaring war as to call out the reserves, have obtained pardon, and returned home to their lamenting families. Here is one of them coming along dressed in the height of fashion as understood at Corfu. He has had a smattering of education in Europe, and gives himself airs accordingly ; and it is difficult to believe that, in order to avoid the discomforts of a campaign against those very Turks whose valour he is always decrying, he was once smuggled on board an Austrian Lloyd steamer in a barrel. The two young men he has just met made the same journey to Trieste inside bales of cotton. Near them is a hero who was not so fortunate ; he attempted to leave the island disguised as a British Milord in a pair of red Dundreary whiskers, loud check trousers, and a Glen-garry cap. In spite of this being the accepted costume of English noblemen abroad, the guards somehow suspected him, and the would-be refugee was ignominiously turned back and sent to join his regiment. However, these little matters are seldom referred to now ; and it is tacitly assumed that all these valorous men were defending the

frontiers of their fatherland during their absence from Corfu.

In the distance, on the seaward side of the parade-ground, are two figures walking with such energy, when compared with the lounging Corfiotes, that most people would imagine them to be mad English. They are, however, the French consul and his chancellor, a most charming little Corsican. Their duties are not very overwhelming, and every afternoon they take a walk separately or together. The consul's chief joy is gumming pictures into scrap-books; and the gem of his collection is a bulky volume into which he has stuck several thousands of those little pictures which adorn the covers of French and Italian boxes of wax matches. They lie in serried ranks across the pages, of every sort and kind, from the coarsely vulgar to the daintily graceful, the former as a rule predominating. The most acceptable offering you can make the consul is a match-box that he has not seen before; and two or three such will secure you his friendship. And, moreover, his friendship is worth having, for he is a most courteous and polished old gentleman, who has travelled much and read much, and who has presumably seen the vanity of all things, since he has given himself up to pasting scraps into albums.

But a fresh breeze is springing up, making my Russian friend shiver, and warning us that it is time for him to go in, and for me to cross over to Vido Island for lawn-tennis. I therefore leave him at the door of the hotel, and going down to the King's Steps, join several English residents and visitors, who, armed with rackets and shoes, are just about to step into the man-o'-war's boat lying off the quay. We dash rapidly across the placid bay to the little island of Vido, where the officers of the English ship on the Corfu station have had an asphalt tennis-court laid down. We scramble up the rocky shore, and over the melancholy ruins of what was once the strongest fortress in the Mediterranean, down to the level on which the court has been built. In happier days, it was evidently a sort of barrack square, for the doorways of some of the buildings are still standing; and it needs all the pleasant surroundings of lawn-tennis, and the joyous vitality of the man-o'-war's men who field the balls, to overcome the grim desolation of the scene. A million sterling was blown into the air when Greece took over the Ionian Islands. It is a capital place for lawn-tennis, and remote from the Corfiote loafer, which is not the least of its advantages; but at last the shadows of the huge and rugged blocks of torn and shattered masonry creep across the level ground beneath them, and soon it gets too dark to see the balls any longer.

The voyage across the bay is even more fascinating than before. The water gleams as it swirls off the blades of the oars, and now and then black hulls start silent and ghost-like out of the haze around us. Along the sea-wall the lights of the town begin to twinkle, while high above all the lighthouse on the Citadel keeps watch over town and bay and narrow strait. All too soon the boat grates against the King's Steps, up which we mount to find the broad street between them and the hotel almost entirely deserted. The evening has fallen upon a long hot day, but—always supposing that the ice-machine has not

broken down—the reward of lawn-tennis and virtue is at hand, and another quarter of an hour will see us at the *table-d'hôte* of *Tous les Ambassadeurs*.

J U D G E D E N T.

A STUDY.

Blow, blow, thou winter wind;
Thou art not so unkind
As man's ingratitude.

It was a pleasant day, late in summer, in the city of Albany, New York. Seated in a dingy but spacious upper room abutting on the principal thoroughfare was a young man. He was by no means a handsome young man; indeed, there was nothing at all attractive about him; and yet, although he reclined lazily in a tilted chair, while he rested his rather extensive feet upon the window-sill, it must have been plain to the most casual reader of human nature that he was energetic and wilful to a more than ordinary degree. As a matter of fact, the lad—he was little more, having but a few weeks since arrived at years of legal manhood—was exceedingly clever, and had just been admitted to the Bar of New York, at the head of his law class; and the while he sat in the window he ruminated regarding his future both immediate and more distant.

Just then the door of the office—the room was the headquarters of the attorney with whom the young man had studied law—opened to admit the postman, who threw upon a worn and ink-besmeared desk a letter, for which he called upon our friend to sign. The registered package bore a British postage stamp and a strangely cramped superscription, whose partly printed and partly written characters showed it to be the work of an illiterate person. The address was intended to read as follows: 'FREDERICK DENT, Esq., Attorney-at-Law, 3350 Broadway, Albany, New York, U.S.A.'

The caligraphy of the communication covered by the wrapper was still more difficult to decipher, but young Dent managed to translate it into fair English. Briefly, it said:

DEAR FRED—I am proud to know you have passed your examination. You will be a great lawyer some day. Perhaps you will be a judge. I owe grudges to more than one judge, but if you are ever one, I will forgive them all. Now, Fred, you know that you are all that I have in the world. I want you to go right on and climb to the top. I want nothing to hinder you, not even your father. You can go some place where you will never hear of me and never see me. Some time when you are a judge, I will take a look at you on the quiet. Meantime, you can forget that you have an ignorant old parent with a dirty record. You cannot change your name, so I will change mine if I ever cross the 'pond' to take a look at you. I enclose a draft on the 79th National Bank of New York City for four hundred pounds. I came by it squarely, and saved it for you. I hope you will make good use of it.—Good-bye, my son.—From your father,

JOHN DENT.

As it was past banking hours, the young man could not cash the draft immediately. He looked at it curiously, then thrust it into his pocket-book, which he buried in his hip-pocket, and reseated himself. Not a thought did he bestow upon the old man who had given him his education, besides ample spending-money and this last handsome draft. He only thought of himself and of his future, now illumined by the golden rays from some two thousand dollars which the draft would yield him. When he began to get hungry, he arose to go to supper, and before leaving the room dashed off a line to the old man :

DEAR FATHER—The letter and money are safely to hand. I think I will go West. Probably will let you know where I settle. You had better stay in England until you hear from me.

FRED.

That was all he wrote, and the note was characteristic of the writer—unsympathetic, business-like, and economical of his own efforts. He went down to the Delavan House and ate a very hearty supper.

John Dent was an old man, with but one redeeming feature. His pride in his boy amounted almost to a passion. All the affection of which the man was capable was lavished upon his son, and all his hopes for the world that now is and that which is to come were centred in the lad. For the greater part of his life, John Dent had been an ornament—or otherwise—to the very lowest strata of society. He had started out as a street vagabond, and long before middle age had become a consummate scoundrel. He had gambled and had operated gambling hells; he had been drunk many times, and had also kept beer-houses in the worst districts of London and Liverpool; he had served more than one term for larceny and burglary, and later in life had been a notorious receiver of stolen property.

During all this time, Dent had maintained his wife and boy in comfort at a quiet and pretty home in Bedfordshire. But the woman died when young Fred was about ten years old, and then the outlaw took the boy to reside with him. Just then John Dent was engineering a pot-house—that was closely watched by the police—near the river in Rotherhithe; and there young Fred grew up for about five years. One day he surprised his father by taking exception to Dent's style of living and methods of gaining a livelihood. Not that the boy took any high moral stand—dear, no! He cared nothing for what the possible result might be to his father, here or hereafter, if he should continue to fill men with beer and whisky that he might relieve them of their money and valuables. Fred only looked at his own side of the question. In a way, the boy was ambitious, and he merely wanted his father to live so that his son might incur no risk of unpleasant reflections upon himself.

'I will soon be through school now,' he said; 'and after that I'm going to begin right away to study law. I shall go to America as soon as I can; but until I go you'll have to be respectable, father. That's all I've got to say. If you won't be—why, I'll disown you, and go away to some

other town, which I certainly will do if you don't get out of this hole.'

The threat was quite sufficient: John Dent moved out Barnet-way and bought a little stock-farm, out of which he managed to make a very fair living. At anyrate, he did not engage in any wickedness more serious than an occasional 'toot;' and if the police of several cities had not been so unkind as to request the chief constable of Hertfordshire to 'keep his eye on Dent, of Rotherhithe,' Fred Dent's father might have become an 'honoured citizen' of the community in which he had settled. But it was, alas! a case of giving a dog a bad name; and it was John Dent's appreciation of this fact which prompted him, years after the Rotherhithe den had been relinquished, and when Fred was a full-fledged American citizen, to write the letter that his son so curtly acknowledged.

If Fred Dent had put into his terse note a little filial sentiment, it might have encouraged his father in the latter's desire to continue a life of comparative respectability. But the old man read between the lines, and understood, more than he ever had before, the cold-blooded nature of the writer of those few and thankless words. The result was immediate and dire; for John Dent, on the very day that he received his son's note, started on a career of drunkenness, in which he never paused until, ten years later, he learned by the merest accident that Fred was a judge of the Common Pleas Court in a county of southern Kansas, and was a candidate to represent his district in the Congress of the United States. John Dent in his dull and brutish fashion loved his boy; but it is doubtful if that boy possessed a single spark of genuine affection for his father. If Fred Dent did love anybody or anything besides himself, it was the law: its study and practice. He saw a fine point quicker and understood it better than half the learned gentlemen who adorned the bench of the State of New York; and young as he was, he could plead as well as the most eloquent counsel in the country.

He would have liked to remain in Albany; but the dread thought of his disreputable parent some day appearing and claiming his filial acknowledgment, like a spectre, for ever overshadowed any such arrangement. He would not even locate in any of the Eastern States, for fear that his father, by means of the newspapers, might become cognisant of his whereabouts and 'look him up.' Fred Dent was blind to the good that was in his father, and it never occurred to him that he might largely aid in developing that little good into something better yet. Fred Dent was eminently selfish and narrow; true, he saw many 'chances' in the world, but they were all chances which only, so far as he could see, might be made available for the aggrandisement of Frederick Dent—provided he could divorce himself from all relationship to his bugbear—John Dent, ex-burglar and saloon-keeper.

Twenty-four hours after penning the note to his father, Fred, armed with all the necessary introductions and credentials, was on his way West to 'grow up with the country.'

Exactly ten years had passed since that afternoon when the postman delivered the registered

package to the young law graduate at Albany, and Judge Dent sat in his private room in the Courthouse at the frontier town of Raleigh, Kansas. Apparently he was by no means contented, for there was a dissatisfied look underneath his knit brow, and evidently his thoughts were not of the pleasantest variety. Strangely enough, the judge was worried about money matters; and, prominent man though he was, he would have been deeply grateful had the postman or any one else walked in at that moment with a draft for four hundred pounds. Judge Frederick Dent was financially embarrassed. His balance at the bank was considerably overdrawn, and his credit in other directions was well-nigh exhausted. Frederick Dent had accepted the judgeship of the Common Pleas Court for the honour attached to the position, and as a stepping-stone to more valuable political prizes. To do so, he gave up a lucrative legal practice, but, with his income reduced at least fifty per cent., continued to live extravagantly. Worst of all, he caught the speculative fever and lost heavily.

He was now, to use a common expression, 'dead broke,' and that when he badly needed ready cash. Ambitious as ever, he aspired to the congressional seat that was about to become vacant, and his chances for obtaining the nomination from his party were exceedingly good. But to secure the nomination, he knew that he must have or control funds; and to successfully conduct his campaign against the other party's candidate, he knew that he must have still more funds.

The longer the judge sat in his office with the frown upon his face, the stronger grew his desire to represent the people at Washington. Before the twilight merged into darkness he was a desperate man.

At eight o'clock he took the Union Pacific train for Kansas City, where he arrived very early in the morning. As soon as he could, he went to a drug-store and made some purchases, and was back at Raleigh to supper.

As Judge Dent left the train, a shabby, gray-haired old tramp with dissipated features entered Raleigh by the wagon-road from the south-east, and at midnight the judge and the tramp met.

Judge Dent kept 'bachelor's hall' in a pleasant residence on the outskirts of the straggling town of Raleigh. At twelve o'clock his coloured man, who was cook and housekeeper, was soundly sleeping, and the judge quietly left his house. It was then that he first met the tramp, who was lounging half asleep outside his gateway; but though the tramp knew the judge at once, the recognition was not mutual, and the judge passed hastily on. He went quickly but quietly down the road for more than a mile until he reached a one-story frame-house by the roadside where dwelt an eccentric old fellow who had been one of Dent's clients. It was a warm night, and the window of this old man's sleeping apartment was half open. Judge Dent took from his coat-pocket a sponge, which he saturated with chloroform, and then tossed through the open window on to the bed where his ex-client lay sleeping. Then he carefully closed the window. Ten minutes later the judge re-opened the window and deftly leaped into the room.

All this time he made not the slightest noise, not even when he left the house, which he did by a door in the rear, and then sauntered homeward 'across lots.' So quietly did he steal away, that not even the old tramp who had followed him down the road and curiously watched him enter the window, knew that he was outside again.

The tramp was more than interested. He was anxious; and as the minutes changed to half an hour and then to an hour, he decided to climb through the window himself and investigate. He got both his feet into the bedroom just as the eccentric citizen, who slept with his valuables under his pillow, recovered from the effects of the chloroform and awoke. Two minutes later the besotted tramp was the robbed man's prisoner.

The next morning there was entered upon the register of the Raleigh police station the name of 'John Smith, vagrant,' charged with burglary; and at ten o'clock, the prisoner pleading guilty, the police justice duly committed him to take his trial for grand larceny.

Judge Dent encountered no more financial difficulty in the path of his political advancement; indeed, he encountered no trouble of any kind; for when, in November, a new congressman was elected, there immediately followed an election for a judge of the Common Pleas Court to fill the place of the Honourable Frederick Dent, resigned. Judge Dent's resignation was to take effect on the 31st of December. On the 30th, he occupied the bench for the last time, to clear the calendar, by trying the case of John Smith, the tramp, committed from the police court on a charge of grand larceny.

Now, the judge had not seen the tramp since he met him outside the gate of his own residence on the night of the burglary, and then he had paid no particular attention to the old man. Indeed, there was no reason why the judge should suppose that the tramp he had then seen and the tramp who had been captured in old Jake Busenbark's bedroom were identical; and most decidedly the judge had not deemed it necessary to mention that chance meeting to any of his friends or to the officers of the law.

The jurymen and the court officers were all in their places when Judge Dent, the pride of his party in southern Kansas, entered the room and took his seat. Then the prisoner was brought in, and the judge recognised him immediately. It was a supreme moment for both the old man and his son; but neither showed by so much as the movement of a single muscle that they were other than utter strangers. If either was the better actor, it was the young man, because he was totally unprepared for the discovery of his disreputable father in the vagrant whom he was to try for his own crime.

The trial did not occupy thirty minutes. The prisoner made no defence, and the jury were in retirement but a few moments when they brought in a unanimous verdict of 'Guilty.'

'John Smith, stand up,' said the Court. The conscienceless judge and unnatural son looked his poor old father full in the face, and never flinched or faltered as he pronounced sentence.

'Prisoner at the bar, your appearance and

bearing prove you to have become entirely lost to all sense of decency. It will be better for yourself and for society at large that you be placed where you can do yourself and society the least harm. The crime of which you have been found guilty is a heinous one, and the Court has no hesitation in pronouncing the severest penalty which the law permits. You will be taken to the State Penitentiary, and there placed in solitary confinement for the term of ten years.' These were the last words that Frederick Dent ever addressed to his own father.

As the prisoner, doggedly determined at all costs to shield the son of whom he was still proud, was about to be led away by his jailers, he said in a strange tone: 'Good-bye, judge.' And they were the last words of the old man to his son.

Judge Dent went to Washington, and made a record as a shrewd politician and great orator; but before his first term was half over, Convict No. 202—née John Dent, alias John Smith—died of a broken heart in the State Penitentiary of Kansas.

ON THE STAIRCASE.

It has been conceded, by those who know, that under some circumstances, such as in large gatherings in large houses, the Staircase affords as pleasant opportunities for interesting tête-à-têtes as the conservatory. It is not, however, from a social point of view only that we are about to look at this important feature. In the construction of a dwelling, great or small, so much depends upon the treatment of the staircase, its general commodiousness, and the particular fitness of its situation, quite apart from its use as a field for private conversations, that it should have a wider consideration.

Our most ancient staircase is perhaps an external one adjoining the remains of the monastic buildings connected with Canterbury Cathedral. This was constructed in the days of the Norman kings, and is still strong. Three large semicircular-headed openings give access from three directions to the low and easy steps, which ascend between two lengths of side-walling finished above with an arcading on small columns. This arcading diminishes in height as the steps ascend, so as to get a level for the roof, which extends over the steps and approaches alike. The large open semicircular-headed archways, and the small arcading of the boundary-walls, admit light freely; and the roof keeps the steps dry and affords ample shelter to those who use them. This is the only example of the kind we have. Similar staircases were called into requisition in situations where halls were built on upper floors; and several exist in France in the old châteaux; but they are of a somewhat later date. This one saw the awe-stricken groups that discussed the death of Thomas à Becket in the cathedral; the commotion when William de Sens fell from the scaffolding, and could continue his task of extending and improving the fabric no longer; the readjustment of things

when William the Englishman took up his work and carried it on; as well as the solemn procession that brought the body of the Black Prince to the cathedral for burial; the grateful content of the French Protestants when they were allowed, in Elizabeth's days, to pursue their calling in the undercroft, and thousands of other circumstances that go to make up the history of our country; and, as mentioned, it is still sound and strong.

There are, however, a few staircases on the Continent with claims to great antiquity. Foremost among them is that under the portico on the north side of the basilica of St John Lateran, in Rome. This is composed of twenty-eight marble steps, affirmed by tradition to have belonged to the house of Pontius Pilate, and to have been rendered sacred by the footsteps of the Saviour. It is placed between two others, by which those pilgrims and penitents descend who ascend the first-mentioned, which they are only permitted to do on their knees. Among the many impressive sights in the Eternal City, it is not the least curious one to see devout persons slowly progressing from step to step up this Scala Santa on their bended knees. Antiquaries allow that when the basilica was destroyed by fire in some bygone century, this staircase, with the chapel at the top of it, escaped the flames, and that it really is a veritable relic of high antiquity. As there is another staircase, in a church at Bonn, which likewise claims to have been formerly owned by Pontius Pilate, this opinion is of more than archaeological value. A second example of considerable antiquity and interest in Rome leads to the roof of the Pantheon. Unlike others made for the same purpose in pagan temples, which are generally spiral, this is constructed on a triangular plan. It has been noticed that the ancients generally chose an odd number of steps, to the end that those who ascended them would have the right foot ready to put foremost into the temple. As a rule, all ancient staircases were narrow and not well lighted. Even those in the Vatican, which are upwards of two hundred in number, were of no great dimensions till Bernini accomplished the grand staircase that still bears his name, and which, with its marble columns, pilasters, and stucco and other ornamentation, adds so much to the majestic aspect of the interior of that stupendous art-palace.

The chief points in an internal staircase are its form, approach, ease of ascent, lighting, and the readiness of access afforded by it to the floors with which it communicates. We have examples that are circular, square, oval, and oblong, and, as mentioned, at least one that is triangular. Those we call winding-stairs, that are made with steps that are narrow at one end, nearest to the newel, and wide at the other, were also sometimes used for straight flights in old times, in fortresses, when the steps were placed alternately, so that the narrow end of one rested on the wide end of another, zigzag fashion, with the intention that those who used them should step on the wide part of each one in ascending or descending. But for the most part the length of a man's foot has been the standard of measurement for the width of a step throughout. Inigo Jones (Iniquity Jones, the Earl of Pembroke called him, after a

quarrel) made so much of the staircase in his designs that he is considered to have shorn other portions of some of his edifices of their due proportions by devoting to it the lion's share of the space at his command. An example of his skill, however, in one of the prebendal houses attached to the collegiate church at Westminster occupies a space that does not exceed twenty-four feet by twenty-three, and yet is considered fit for a palace; and was so admired by Sir John Soane as a triumph of masterly construction, that he had a set of drawings made of it to illustrate one of his lectures at the Royal Academy. The state staircase in Windsor Castle occupies a space measuring about fifty feet by thirty-six feet. The steps of the grand staircase in Buckingham Palace, it may be mentioned, are of white marble, like the range of double columns in the hall out of which it rises. Generally, however, the steps of the grandest examples are made of hard white stone. Those of the principal staircase in Alnwick Castle measure twelve feet in length, and the landing-stage is composed of one stone twelve feet square. A frequent arrangement consists of a commencement with a central wide flight of steps, which, at the first landing-stage, divides and departs in two opposite directions. The new Opera-house in Paris has a staircase of this kind. To make the steps of one of the grand staircases in the Louvre, it has been asserted Charles V. brought ancient tombs from the church of Saint Innocent's, because the Paris stone did not furnish blocks of the necessary dimensions in sufficient numbers.

Perhaps the first winding stair of which we have any account is that built by Solomon in the Temple at Jerusalem. In the first Book of Kings we learn that the core of the temple was a building composed of three tiers of chambers surrounding a central inner courtyard, and access was afforded to the upper rooms by a winding stair. We read, 'the door for the middle chamber was in the right side of the house, and they went up with winding stairs into the middle chamber, and out of the middle into the third.' From those days to these the winding stair has been in general use. There is one, dark and steep, leading to Queen Mary's boudoir in Holyrood Palace; another in Ford Castle, where James IV. slept the night before the battle of Flodden; another in Rochester Castle, not so dark, but still steeper, winding higher and higher; and countless others in many a noble pile and proud tower. Up and down these difficult communications, winding round and round, came the strong man-at-arms, the mail-clad knight, the dame of high degree, her maids, her children, and the numerous servitors required in days when the absence of all the conveniences we now possess, such as water-supplies, postal service, public modes of transit and conveyance of goods, called for a large retinue. In ancient mansions in which the old peel-towers of former generations are incorporated, these winding stairs still in use bring vividly before us some of the details of mediæval life, and with them some disenchantment. They also prosaically illuminate such legends as that of the forlorn lady, turned out of doors by a cruel baron, who took refuge in a tower, and carried a pet calf up-stairs every night, and continued that feat for a long time

after it became a cow; and of horses that have made the same wonderful ascents.

In Hexham Abbey Church there is a stone staircase open to the south transept, very gray and solemn-looking, which is the same that was used by the monks in former times when they came from their dormitory and descended into the sacred building for their periodical services. As they came down step by step they would see the shrine of Robertus Ogle, the Saxon friar, the effigies of Wilfred, Acca, and other saints, the shrine or oratory of Prior Richard, the great screen painted with Death's Dance, and the sculptured altar, not dimmed and darkened as we see them, but nearer to the condition in which they left the hands of the artists who embodied their thoughts in them. It still affords a pleasant coign of vantage, whence the noble proportions of this fine work of our forefathers can be conveniently surveyed. There are but few ecclesiastical edifices that have preserved the staircases that communicated with the dormitories in this manner.

In our own time, grand staircases in buildings in which state ceremonies are held or state visits paid afford spectacles of surpassing interest on account of the passing to and fro of the company in ascending and descending. The sheen of rich clothing, the flash of jewels, the hues of uniforms, the plumes, flowers, plants, the general evidence of wealth, health, and beauty, produce kaleidoscopic effects not met with elsewhere. They have, however, their occasional tragedies, as witnessed in the terrible disaster that took place in the Victoria Hall at Sunderland a few years ago.

A QUERY.

You saucy blackbird, singing to your mate among the cherries,

Will you cease awhile your liting and give me an answer, please?

Did you see a maid pass lately, with lips redder than the berries

That so temptingly are swaying in the pleasant morning breeze?

Her eyes are like the blue speedwell, her hair has sunlight in it,

Her voice is like the sighing of the south wind 'mid the flowers;

And I love her very dearly; then, blackbird, stop a minute,

And tell me where she's wandering through the long sunshiny hours.

Tell me, is she in the woodlands where the violets are dreaming?

Did she take the meadow pathway that leads to the river-side?

For the noonday sun to-morrow shall behold our good ship steaming

Far away, and I would ask her if she'll one day be my bride.

AFTER THE HAY WAS IN.

WHEN they said to me, 'Of course *you* are going to the bean-bake with us?' I responded in the affirmative with much alacrity. During the twenty-four hours which had elapsed since my arrival at my cousin's house I had heard much talk about this bean-bake, and was not a little curious as to its nature. From the eager way in which the three boys discussed it I surmised that it was some sort of rural festivity hitherto unknown to me. I believe a bean-bake to be as much of an 'institution' in and peculiar to the state of Maine as the clam-bake is to its sister Rhode Island.

One beautiful moonlight night, late in August, when the hay was all in, and the farmers could consequently take a brief holiday, a dozen or so of people, men and women, but mostly the latter, went to a pine-grove on the borders of the broad Penobscot river and camped out. They had two roomy tents, in one of which the weaker sex slept, while the other was occupied by the men-folks. Early in the evening a pit was dug in the ground, about two feet wide and deep, and four or five feet long; the bottom was covered with stones, and on them a fire was kindled. In the course of an hour this impromptu oven was ready for the beans. Two large three-footed iron kettles with close-fitting iron covers were now brought into requisition. Each was filled about two-thirds full with white beans which had been previously picked over, well washed, and then allowed to stand in tepid water while the pit was being heated. These beans must always, to be at their best, be chosen from last year's crop. When the pit was ready, the water was poured from the beans, and they were transferred to the kettles with the addition of a tablespoonful of molasses and a piece of salt pork as large as a man's two fists, for each kettle. The lids were put on, weighted for safety with a couple of large stones, and then the kettles were set in the pit. From that time—about ten o'clock at night—until the next day at noon the fire was kept up, the

men taking turns in watching and replenishing it.

Soon after our simple breakfast—we were saving our appetites for the beans!—the various invited guests began to arrive: some in a buggy which held but two; some in 'carryalls' in which five or six thin people could be packed; and one party, the largest, in a large coach with four horses. This came up from Bangor, and held nine grown people, six children, five or six heavy baskets, and a huge water-melon, which had arrived from Georgia just in time to be sacrificed at the bean-bake. For beans are not the only comestible on such an occasion; nothing eatable or drinkable comes amiss. Although the giver of the entertainment provides the backbone of the feast, it is after all a sort of 'Dutch treat,' as every guest is permitted—not expected—to contribute something. For instance, the Bangor coach brought several bottles of ginger ale and raspberry shrub, a large veal loaf, two fruit-cakes, several pounds of sweet biscuit—'crackers' they are called here—and six mince pies.

The table was spread under two of the tallest pine-trees. It consisted of long planks supported by trestles; but it was covered by the whitest of table-cloths, and spread with nice china, glass, and silver. Its adornments were very suitable. In the centre was a large celery glass full of tall spikes of pink hardhack blossoms set off by feathery twigs of juniper; here and there were tumblers filled with young ferns, fragile bluets, wild asters, and golden rod, and set in plates of moss dotted with bunches of the brilliant scarlet partridge berry. Overhead was a brilliant blue sky, across which fleecy clouds sailed now and then, and genial sunbeams peeped down upon us through interlacing branches of tall old trees. Beneath our feet was a thick, soft, dry carpet of pine needles; and for footstools we could use the many projecting roots. In the distance, faintly visible, was the swift-flowing Penobscot, as blue as the sky above it. Occasionally an Indian—clad in our costume, however, for the Indians

here are civilised and educated—would flit along in his graceful birch canoe; but he paid no heed to us nor we to him; we knew he had no evil intent.

The Indians in this vicinity make large numbers of baskets, boxes, toy chairs, cradles, canoes, &c., out of pliant willow and sweet grass. The latter retains its delicate perfume for years. By the laws of Maine the Indians are permitted to cut willow twigs wherever and whenever they find them. In the summer they take their wares to various fashionable resorts, where they sell 'like hot cakes,' and at a good round price too.

But it is past noon, and the beans are ready; so, too, are the lemonade—the water from a cool spring close at hand—the hot coffee, the brown bread, which is the spouse of baked beans, and the 'baked Injun'—not a roasted aborigine, however, as a stranger might suppose, but a rich pudding made of Indian-corn meal, cream, spices galore, plenty of rich butter, and molasses. We gather around our host's 'board,' one of the guests—a minister—from Bangor says grace, and then what a clatter of tongues! what a rattle of spoons and knives and forks!

There is no restraint, for we are all in some way, more or less distant, related to our host and his wife; all of us, that is, except the minister and his wife. To be sure, some of the relationship is a little puzzling; for instance, two whom I call cousins are daughters of my grandmother's youngest half-brother. We present a range of ages—from our host, well up in the sixties, to his little grandniece, just past her sixth birthday—and a variety of conditions in life.

We sit long at table, enjoying our viands and one another's society. When we do rise, the 'clearing-up' is an easy matter, for helping hands are many. The men stroll off to smoke and to look after the horses, which have been unharnessed and led to a shady grassy spot near by. The boys go to the river to fish; of course they catch nothing, but, strange to relate, not one of them gets a ducking. They have been strictly forbidden to go in swimming or bathing, because the current is swift and the water deep; but when they appear at supper-time their heads are suspiciously sleek. The tents are a nice place for the older folk to utilise; they take their siesta undisturbed by flies, sun, heat, or noise.

Supper is a formality, except for the omnivorous boys. As the sun seeks the horizon, the horses are harnessed, empty dishes are returned to their hampers, and we disperse in various directions.

The weather is so very fine, that, two days later, some one suggests that one of these moonlight nights is just the thing for a corn-roast. This is also an unheard-of festivity to some of us; so our host has no trouble in marshalling about twenty who have health and courage to brave the night-air. Green corn is now in an eatable condition. Great piles of it are cut, each milk-white ear is stripped of its layers of green husks, each layer becoming more delicate, until those next the tender milky kernels are as soft as satin. The long strands of silk are carefully removed, and then the ear is ready

for cooking. For use at table, green corn is boiled and generally served entire.

To-night, a brave bonfire is built on a clearing about half a mile from my host's house; great logs are thrown on it as soon as the preparatory blaze of dry brush is thoroughly alight and—oh, what heat arises! It was chilly that night, now that the sun had been gone an hour, and at first we sat around the blaze and said: 'How nice and warm! How cheerful!' But when the great logs began to glow, we were glad to withdraw to a respectful distance.

While this fine bed of glowing coals was preparing, the men had cut long slender boughs from neighbouring trees and sharpened one end of each. Then they impaled an ear of corn on the stick and thrust it into the embers, where a visit of a very few moments was enough to entirely change its character and appearance. Good? Yes, indeed! Part of it, that is; for the extreme ends of each ear were apt to be blackened by the smoke, so that it required dexterity to enjoy the well-cooked centre without having your nose and both cheeks pretty well blackened.

This is one of the occasions when you must remember the old adage, 'Fingers were made before forks.' You must take the ear in both hands and gnaw the sweet juicy kernels from the cob. There is no other way to eat roast corn, and no other way to really enjoy boiled corn. Quite often the half-cooked ear will fall from the stick into the fire; then it is gone. It is therefore fun to look out for the safety of your own ear and at the same time try to jostle your stick against that of some unwary neighbour. The fire is so hot that your impromptu toasting-fork has to be at least twelve feet long. It is customary at such times for the men to do the cooking, as their cuticles are usually less injured by heat than those of the fairer sex, while the women sit by and entertain them, perhaps tease those who lose their corn, and then eat the corn as it is passed to them.

DUMARESQ'S DAUGHTER.

CHAPTER XXXVIII.—ACROSS THE DESERT.

It was an endless journey, that journey across the Algerian mountains to Biskra. Cyrus Vanreuen had ample time on the way to reflect about the fate of the Cincinnati Pork Trust, and the Fifth National Bank failure. More than once on the road, indeed, weary with delays of the true Oriental pattern, he said to himself with a sigh that for any one less high-toned than Psyche Dumaresq he wouldn't have undertaken such a wildgoose chase. Which, to say the truth, was doing himself an injustice; for that honest soul would have done as much, any day, for any one else so unhappy and so lovable.

Still, the trip was undoubtedly a trial of patience. The line, in those days, went no farther than Constantine, whose beetling crags Cyrus and Corona reached, tired out, at eleven at night, after a weary day's ride in a dusty, dirty, slow African railway carriage. They had no time, however, to look at the wonderful old town, perched like a robber fortress on its isolated crags, nor at the

river running deep in its riven gorge a thousand feet below; for the diligence for Biskra left by five in the morning; and after a short night's rest, they found themselves at that hour in the chilly gray dawn crossing the antique Devil's Bridge that spans the profound ravine, and 'lighting out,' as Cyrus graphically expressed it, for the desert.

It was their first experience of desert travelling. And they didn't like it.

For four long days they jolted on in suspense, across the mountains and the sand-flats, ever up and up, towards the oasis at Biskra. The road was indeed a wild and weird one, winding steadily upward, between arid hills of white powdery limestone, towards the high plateau of the Great Sahara. Few trees or flowers diversified the way; and those few were dwarfed and scrubby and dusty in hue, as if developed on purpose to match the grim gray high-road. Dust and rock, indeed, formed the staples of the scenery. They halted for lunch at a grimy *auberge* by two desolate salt lakes; and then, up into the grimy diligence once more, and across the arid hills again, full pelt for Batna.

They were well into the heart of Africa now. Black Arab tents dotted the hillsides, and caravans of camels, in long weary strings, stepping slow and faint, passed them, ever going seaward. Trot, trot, trot, at a dreary jog, they rattled along all day; and late in the evening, they pulled up short, with uncomfortable brusqueness, in front of a dismal green-blinded hotel, in a fifth-rate Frenchified colonial village of barracks and cafés. And this was Batna.

Next morning, the same routine began over again. Day after day they rolled on and on, through sand, and dust, and rock, and sun, in the same aimless, hopeless, forlorn fashion. At dawn, they started among bare sunburnt hills; at night bare sunburnt hills stretched still for ever in long perspective before them. They seemed to go all the time from nowhere to nowhere. Only, as they went, the desert grew drearier and ever drearier, and Corona's heart sank deeper and deeper. By the third day, the abomination of desolation spread everywhere around them. The soil gaped in great valleys of sand. Deep in the fissures below, they could see the dry beds of prehistoric streams that drained into seas now dead and forgotten. The caravans here passed more and more frequently. But Cyrus and Corona cared little to observe the tall gray sheikhs in their white burnouses, or the women with their faces picturesquely tattooed, and their arms and throats heavily laden with barbaric jewellery. Not even the little children, playing naked in the sand with their bronzed limbs, could tempt them to look out any longer from those dusty windows. They had fallen into the lethargy of desert travel, and cared only to hurry on at such full speed as weary horses could effect, to Biskra. Their one wish was to relieve Psyche from that terrible strain of suspense and agony.

At last, the very road itself failed them. The diligence began to thread its way by some strange instinct across a trackless sandy plain, covered with naked brush, and strewn here and there with monstrous rounded boulders. On, and on, and ever on, starting in the morning from the middle of Nowhere, and pulling up at night in

the self-same spot, to all appearances, they trudged through that monotonous sea of sand till the fourth day was fairly over. The fourth night came on, but still the sea of sand spread everywhere limitless around them. Corona leaned back in her place and dozed. How long, she knew not. She woke with a start. What was this? A jolt, a jerk, a stoppage! She jumped up, half expecting to find they were upset in the desert. Had Bedouins come to demand their money or their life? But no. Strange change! They were rattling along a broad paved street. Around, were lights, noises, human habitations. Cyrus put out his head at the door. Yes—no mistake this time. It was really Biskra. The diligence drew up with a sudden pull at the door of an hotel, simple but European-looking. The transition was marvellous. They had crossed for four days the outskirts of the desert, and they woke up now to find themselves still within touch of civilisation on the tiled vestibule of the Hotel du Sahara.

All the way along, as they dashed and jolted over the desert plain, one thought alone had been uppermost in their minds—would they find Linnell when they got to Biskra? And now, as they descended, weary and dusty, from that rumbling stagecoach into the cool white corridor, the first question that rose instinctively to Cyrus's lips, in very imperfect French, as the landlord advanced, bowing and scraping, to meet them, was the gasped-out phrase, delivered with the utmost anxiety and emphasis, 'Y a-t-il un M. Linnell à la maison?'

The landlord smiled and bowed and retreated. 'This way, messieurs et dames—this way to the salle-à-manger. Table-d'hôte is over, but the restaurant à la carte is still open.—No, monsieur, we have no gentleman of that name at present at Biskra.—What will monsieur and mademoiselle require for supper after their long journey?'

Eating and drinking were nothing now to Cyrus. He waved the man aside with his hand impatiently. 'No gentleman of that name!' he cried in his despair. 'Perhaps, though, he's staying at some other hotel. I'll go out and search for him.'

'Monsieur,' the landlord replied, with offended dignity and a profound bow, 'there is no other hotel at Biskra. *Cabarets*, if you will, *estaminets*, *cafés—fonduks* where Arabs and camels herd together—but no hotel: no other house where a gentleman of the distinction of monsieur and his friends is at all likely for one moment to establish himself.—Will monsieur come this way to see his rooms? The hour is late. To-morrow, the administration will willingly charge itself with the duty of making all possible inquiries for the friend of monsieur.'

'Stop!' Cyrus cried, unable to rest till he had cleared up this uncertainty. 'Haven't you heard whether an Englishman, a refugee from Khartoum, is crossing the desert in a caravan from Ideles and Ouargla?'

'Monsieur,' the landlord said, still polite and impressive, but growing impatient, 'do I not assure you that to-morrow we will make all possible inquiries? Monsieur your friend is not in the town. Accept my assurances. But as soon as we can, we will discover his whereabouts.'

That closed the matter for the moment. It was

no use arguing. The landlord, good man, was bland but imperative. Cyrus was compelled in the end to retire, vanquished, to his own bedroom.

Supper, to their surprise, was clean, neat, and simple. The hotel, though rough, seemed pleasantly cool and quiet; and they found the beds soft, fresh, and excellent. French civilisation stood clearly on its mettle, resolved to create a miniature Paris in the oases of Sahara. But Cyrus hardly slept a wink that night for all that. He seemed to have come the whole way in vain, and to be as far from the object of his search as ever.

Towards morning he dozed, and awoke with a start—to find at last it was broad daylight. The desert sun was pouring in at the window in one fierce blaze of light. He rose and looked out. The beauty of the scene fairly took his breath away. It was a paradise of palm-trees. Great graceful stems rose by thousands on every side, waving their long lithe arms in the air to their own slow music. He dressed in haste, swallowed down a cup of morning coffee, and sallied forth alone into the one long street of Biskra. There, he made his way straight to the Mairie of the Commune, and proceeded to ask for such information as he could gain about the rumoured English traveller.

His heart gave a jump when the courteous official, who received his request with a smile, motioned him into a chair, and proceeded to overhaul with the usual deliberation a well-worn bundle of green-tape-bound letters. Nothing in France or any French colony without abundant green-tape. Cyrus waited and listened eagerly.

At last the courteous official, after much hunting, found the particular docket of which he was in search. 'Monsieur,' he answered, consulting it, with his most consequential air, 'we learn in effect that on the 20th of this month a caravan from the desert did really arrive, much distressed, at Ouargla. In that caravan, as our agents advise us, was a person, supposed to be a European, and giving his name as Linn or Linnell, whom we conjecture to be an English refugee from Khartoum: but on this subject, mark well, our government has as yet no official information. This person Linnell—as we believe him to be named—is now seriously ill with fever at Ouargla. He will proceed by caravan to this station, as soon as our agents consider him in a fit condition for desert travelling.'

'Ouargla!' Cyrus cried. 'Where's that? Can I wire along? Is there any telegraph there?'

The official smiled once more, a provoking smile. 'Monsieur,' he answered blandly, 'here the world ends. Civilisation stops dead short at Biskra. Ouargla is merely a frontier post. No mails: no telegraph.'

'Well, but how did you get this news then?' Cyrus asked in despair.

'There are missionary brothers at Ouargla village,' the official responded in the same bland voice. 'They took charge of the invalid, and forwarded the news to us.'

'How can I get there?' Cyrus asked, determined at once to go on and meet his man, in the midst of the desert. 'Is there any diligence?'

The official smiled still more broadly than before. 'You can go on foot,' he answered.

'Or you can go on a camel. But there are no roads, no vehicles. For myself, I advise you to await your compatriot here in Biskra.'

In a moment, Cyrus's mind was made up. The Western American does not debate: he acts instinctively. Off without a second's delay he rushed to the telegraph office, and sent a despatch to Sirena at the Orangers: 'Man supposed to be one of the Linnells lies dangerously ill at a place called Ouargla. Am crossing the desert on a camel to find him. Mean to reach him, dead or alive. Shall wire again when I have anything to communicate.'

Three hours later, Corona and he were making their trial trip on the ship of the desert, outward bound, with a rolling sea, from Biskra to Ouargla.

Camel-riding is by no means an easy art for a stranger, and they were both beginning to get terribly tired of the pitching and tossing under that burning sun, when, some miles from Biskra, they descried in front of them a long line of patient beasts threading their way with slow and stately tread to meet them over the desert. Cyrus's heart came up into his mouth as he pointed towards the distant line eagerly, and exclaimed in French, with a gulp of surprise: 'What do we see over yonder? A caravan from Ouargla?'

The Arab by his side caught at the words quickly, and summoning up all his French, replied at once, with many shakes and nods: 'Oui, oui: caravan: du côté d'Ouargla.'

There's something inexpressibly solemn about the stillness and silence of the great desert. Even Cyrus's Western American mind felt awed for a moment at sight of that long string of gaunt-limbed beasts silhouetted in black against the pale sky-line of that gray desolation. He looked and wondered. The caravan advanced to meet them very slowly. Its camels, Corona could see for herself, as she clung to the projecting pommels of her own saddle, were weary and footsore with their long tramp across the burning sand from their distant station. Most of them were laden with heavy bales, and led by drivers, who walked by their sides with the free bold step of the untamed Bedouin. Their humps were shrunk away to mere bags of skin that lopped over and fell on their bare sides—the sure sign of a long and tedious journey. But what attracted Cyrus's attention more than anything else was a sort of litter or palanquin, that occupied the midst, borne by four bare-legged M'zabite bearers, and apparently containing some stranger of importance. His heart beat quicker for a moment at the sight. That litter must surely contain—the mysterious Englishman.

'Halt here!' he cried aloud to his Arab driver; and the Arab, accepting the tone for what it meant, with a sudden jerk brought the camel to a walk and then by slow degrees to an unwilling standstill.

'Does any one of you speak French?' Cyrus called out in the nearest approach he could make to that language from his uncertain perch on the animal's back.

The foremost Arab of the caravan bowed politely in answer. 'Monsieur,' he answered, in what even Cyrus recognised at once for the pure Parisian of an educated gentleman, 'I am

a Frenchman myself. What can I do for monsieur?

'You a Frenchman!' Cyrus cried, surprised, scanning his Arab dress from head to foot attentively.

'Yes, monsieur. We missionary priests of Our Lady of Africa dress always thus in Arab costume,' the stranger answered quietly. 'For that, they call us the White Brothers. We have come from Ouargla in charge of an English refugee from Khartoum. We are taking him for a European doctor to see at Biskra.'

In his eagerness and anxiety Cyrus scrambled down boldly from his seat on the camel, and approached the missionary with a perfect torrent of inquiries.

'Do you know his name?' he cried. 'Is he ill? Do you think he'll recover?'

'Monsieur, we do not know his name, because he is far too ill to be questioned yet; but the name on a paper he carried in his pocket is Linnell, we notice.'

Cyrus could hardly restrain himself from crying out aloud in his delight and surprise. But which Linnell? That was now the question. 'I have come in search of him,' he cried, all eagerness: 'I came from Algiers on purpose to look for him. Is he in the litter here? Can I see him, monsieur?'

The missionary beckoned to the M'zabites by the litter, who had halted to observe the upshot of this curious rencontre. One of them, obedient to the unspoken command, lifted up with his big black hand the corner of the curtains that concealed the patient. There, on a mattress, with closed eyes and bloodless cheeks, lay stretched, half dead, a man with a long dark beard, the growth of a year spent in the tropical African interior. The man, who had once been tall and handsome, and who still bore on his face something of the type of the English aristocrat, was evidently very ill indeed. He never opened his eyes even when they halted, nor gave the faintest sign of life or motion. To Cyrus, this suspense was terrible indeed. To think he had found the very man Linnell, whoever he might be, and yet could not solve that last awful question—for Psyche's sake—whether it was the artist himself or his soldier cousin!

The man looked like a soldier. And yet there was something of the artist, too, in the cut of the features, so Cyrus fancied.

'How did he get to Ouargla?' the young American asked again with profound interest.

Corona leaned over from her saddle in breathless anxiety to hear the answer.

'There's some mystery about it,' the missionary replied, letting drop the flap of the litter once more. 'All we know is this, from what we can gather—there were two of them at first, but one was murdered. So much he managed to tell us in brief when he tottered, more dead than alive, into Ouargla. They seem to have struggled across the desert with a passing caravan; but some difficulty arose, we don't know what; and they got separated from their party, we imagine, some way from Ideles, though we know nothing yet for certain. Then there was a fight—a fight or a pursuit. At anyrate, this poor fellow staggered in at last, to a friendly caravan, alone and wounded, his burnous stained and clotted with

blood, and a couple of flesh-cuts on his shoulder unhealed; and all the account he could give of himself was merely what I tell you—that he had lost his camel two days before, and had come on on foot, for many kilometres, in the direction of Ouargla.'

'He was wounded!' Cyrus exclaimed, aghast.

'Yes, seriously wounded. And from what he mumbles now and again in his delirium—for he's very delirious—one of our brothers, who understands a little English, believes there was some fight either with Arabs on the way, or with a fellow-Englishman.'

'Corona,' Cyrus cried, 'this is our man, of course. We must go back to Biskra, and telegraph to Miss Dumaresq.—Will he ever get any better, Father? If possible, before he dies, I must manage to have a few words at least with him.'

The missionary shook his head slowly. 'He may,' he said, 'or he may not. Who knows? Le bon Dieu disposes it. But in any case I think it would be dangerous to question him.'

Cyrus mounted his camel in silence once more. It was painful to remain in such suspense so long; but there was no help for it. They rode back solemnly with the caravan to the hotel at Biskra. There, the invalid was lifted with care from his litter, and laid in comfort on a European bed—the first he had slept upon since he left Khartoum in fear and trembling a twelvemonth earlier.

Late that night, as Cyrus sat in the bare small salon, endeavouring to spell out with much difficulty a very dog-eared paper-covered novel in a foreign tongue by a person bearing the name of Daudet, the White Brother came in with an anxious face, and laid his hand authoritatively on the young man's shoulder. 'Come, mon fils,' he said: 'the Englishman is conscious. He would like to speak with you for a few short minutes. He seems to be in a very critical state, and would perhaps wish before he dies to unburden his soul—to make some statement or entrust some commissions to the ear of a compatriot.'

Cyrus rose and followed the priest eagerly into the sick-room. He would now at least learn which of the two it was. In five minutes more poor Psyche's fate would be sealed for ever. He would learn if it was the artist, or his soldier cousin.

(To be continued.)

REPAIRING TELEGRAPH CABLES AT SEA.

PROBABLY most people suppose that a submarine electric telegraph cable when once laid remains always practically efficient, and, recalling the history of the laying of the first Atlantic cables, imagine that the chief difficulties of telegraphing beneath the sea arise from the danger of the cable parting or giving way during the actual process of laying. But a cable when once laid is by no means secure, and is likely to be broken or injured in many ways. In the early days of submarine telegraphy it is true that cables were often broken during the process of laying, either from imperfect paying-out machinery or

from hitches in the coiling on board the ship ; but paying-out gear is now so perfect, and cables are so carefully coiled in the tanks of the ships, which are often built for this special work, that failures in laying a cable are not nearly so numerous as they used to be. After a cable is down in its place, however, it is exposed to many dangers ; and if it is once injured, it can only be repaired by being brought to the surface, in order that the injured portion may be cut out and a new piece inserted. Cables may be injured in many ways. The shore end, which is laid in shallow water, may be either cut by the dragging of ships' anchors across it, or frayed by the motion of the sea continually rolling it on the bottom. A cable in that position may, however, usually be very easily raised by under-running it from the shore ; but when sand or mud has accumulated above it, it is sometimes difficult to raise it from its bed, and in such cases strong supports which carry stout tackle have to be set up where a boat would not afford sufficient purchase. In deep water a cable may be injured by chemical action eating into it, or by the inequalities of the bottom causing a strain which results in a fracture. Such inequalities often occur where coral reefs are found.

It is repairs to cables of this description which require the most care in their management, and such cables have frequently to be raised from a depth of over two thousand fathoms. Telegraph companies accordingly keep repairing-ships specially fitted, and some of them specially built, for the purpose, such as the *Mirror* and the *Magnetic*—the latter of which is supposed to have foundered with all hands, and both of which were in the employment of the 'Eastern Telegraph Company.' The *Scotia*, once the favourite ship of the Cunard line, is now also fitted up for and employed by the 'Telegraph Construction and Maintenance Company.' The English postal service likewise possesses a ship, the *Monarch*, to keep in repair the government cables running round our coasts. Telegraph repairing-ships carry, in addition to the usual complement of a ship's company, a large staff of extra hands, some of whom are skilled workmen, and an electrician, who, by means of scientific testing instruments, can determine with considerable accuracy the distance along the cable where a fault or break has occurred.

When a cable breaks down, the electrician is sent for ; and he first determines from the station ashore, by means of his instruments, the whereabouts of the fault. The line of the cable has been carefully marked on the chart when it was first laid down ; so, when the place of injury has been determined, the ship proceeds the required distance, allowance being made for the slack, usually from ten to fifteen per cent., according to the known depth of the water. And now the real work commences. If the fault is near the land, the position is further determined by bearings ; but if the ship is out of sight of land, the usual observations have to be made by the sun or stars, and have in this case to be made with great accuracy. A sounding is then taken to measure the depth, and a mark-buoy is put down in the following manner. A mushroom anchor is lowered, to which are attached a short piece of chain, and a stout rope constructed of hemp and wire of the required length. At the end of the rope is fixed

a large buoy, surmounted by a flagstaff, on which is fixed a flag or wicker-work cone, which can be seen in clear weather and smooth water at a distance of from four to five miles. The ship then goes to the right or left of the line of cable and proceeds to grapple.

Various classes of grapnels are used, according to the depth of water and the state of the bottom. If the depth is very great, a grapnel has sometimes to be used which grips and cuts the cable at the same time, so that only half the weight of it has to be raised. On rocky bottoms, a 'centipede' grapnel is used, which is a sort of long iron bar set with short prongs from four to ten in number ; but on a muddy bottom an ordinary grapnel with long prongs can be used. Grappling may be described as fishing on a large scale, the fishing-line being a strong rope of wire and hemp capable of bearing a weight of several tons. When the grapnel is down, the ship steams slowly across the line of cable, the officer in charge either sitting on the rope or feeling it with his hands until he gets a bite. These bites vary in quality ; but an experienced hand will soon know whether he has touched the cable, or only hooked a rock or some other obstruction. A hold on a large rock will, however, sometimes pitch the man in charge from his post, unless he is on the alert. There is an instrument called a 'dynamometer,' through which is passed the rope to which the grapnel hangs. The instrument records the amount of strain, on a dial ; and if a severe strain is indicated, more rope is at once paid out, to prevent a break. The best indication of a true bite is a gradual and increasing strain.

Of course grappling can only be carried on in fine weather, and even then the ship may cross and recross the line of the cable for days and even weeks before a successful hook is made. This important preliminary having been accomplished, the next thing is to raise the cable to the surface. This is done in the following way : The picking-up gear, which is of course worked by steam, is set in motion, and the ship is, as far as possible, kept in such a position that the grapnel rope hangs down in a perpendicular direction. All the time that the process of picking-up is going on, the dynamometer is carefully watched, and if too great a strain is indicated, the machinery must be stopped. It sometimes takes three or four hours to raise the cable to the surface, and there is even then sometimes the bitter disappointment of the cable parting just before it can be got safely on board.

The picking-up gear must be described. It consists of a large iron pulley or sheave fixed at the end of a frame which projects from the bow of the ship. The grapnel rope is passed over this sheave, and led along a long trough till it passes under the wheel of the dynamometer, which is lifted up and down on a figured scale by the varying strain. From the dynamometer the rope is passed round a big drum worked by steam. When the cable appears above the surface of the water, two men are lowered from the bows on a sort of seat, called a boatswain's chair, and firmly secure the cable with chains on each side of the grapnel. The cable itself is then cut at the grapnel with an axe or file, and one end of it is hove on board and tested by the electrician. If the end is found to be sound, it is fixed to a

buoy, which varies in size according to the depth of water and the weight of cable to be carried, and carefully lowered overboard. If, however, a 'fault' is discovered, the electrician by his instruments determines its position, and consults with the captain or the cable-engineer as to the advisability of picking up to the fault or of making a splice and grappling afresh. The other end is then treated in a similar manner. Should it be decided to pick up to the fault, the cable is passed over the sheave and attached to the drum, which is set in motion, the ship's engines also being worked if required, to prevent too great a strain on the cable. The cable as it comes in is carefully coiled away in one of the tanks, if it is worth preserving.

When the fault is at last reached, if it should prove to be only a bruise or some defect of that sort, the faulty piece is cut out and a new piece is spliced in; but if, as is more usually the case, it results from a fracture, the position when the end comes up is carefully observed, and a mark-buoy is lowered. The other lost end is then grappled for as before; and when it has been got on board, the two ends are spliced together, and the cable is fit for its work again. Sometimes several faults are discovered, and the processes which we have described have to be repeated many times, so that a period of several weeks often occurs before an injured cable can be again made fit for use. Before describing the method of splicing, it will be necessary to describe a telegraphic cable.

Telegraphic cables are constructed with a centre or core of seven copper wires, which are encased in a coating of gutta-percha. This core is enclosed in a wrapping of flax, which is in turn covered by strands of steel wire, the size and quality of which depend on the required strength of the cable. Lastly, the cable is protected by a covering of well-tarred hemp, calculated to resist the action of the water. The first thing in splicing is to join the two pieces of core carefully together, and this is usually done by a skilled workman called a 'joiner.' He brazes the copper wires together, and encloses them in their coating of gutta-percha, and the outer coverings are then carefully put on so as not in any way to injure the interior core. The splice being completed, an operation which takes about an hour and a half to accomplish, the cable is paid-out again. If it is only a short piece which has to be relaid, this is done from the sheave at the bows; but if there are several miles of cable, it is passed aft, and paid-out over a similar sheave at the stern, and the ship's course is laid towards the other end of the cable, which, it will be remembered, has been left buoyed at the surface, and the two ends are connected by another splice. The final operation is 'slipping the bight;' this means a very careful lowering over the bows, which is effected by means of ropes attached to the cable.

In all these operations great care is required in working the ship that no undue strain may be made on the cable, which is often on board for some hours; consequently, the duties of officers and men are beyond those of ordinary seaman-ship. On the other hand, there are a good many spells of rest for the ship's company when the ship is lying in port waiting until her services are required; and these periods in some way make

up for the unceasing attention and care which are necessary when the ship is at work. Deep-sea cable-repairing is one of the many ways in which a sailor's duties have been developed by the requirements of modern inventions and modern enterprise.

THE HEIR OF ROTHWELL CHASE.

CHAPTER V.—CONCLUSION.

AFTER an early breakfast on the morning of the day following that of his visit to the cottage, Evan Marchmont booked himself by train to Whitcastle, a town about a dozen miles away, whence he at once despatched the following telegram:

'From Squire Baynard, Oak Dene, Whitcastle, to Sampson Abrey, Marshmallow Cottage, by Wakenham.—Call upon me here at four o'clock this afternoon, without fail. Want to see you about purchase of fodder.'

The effect of this message, as Evan calculated, would be to take Abrey from home for two or three hours at the least, for not till he should reach Oak Dene would there be any possibility of his discovering that the message was a fictitious one. Than Squire Baynard, there was no man better known in those parts.

At a quarter past three the same afternoon Evan drove out of the yard of the Black Swan in a dogcart which he had hired for the occasion. By the time he should reach Marshmallow Cottage, Abrey, assuming him to have carried out the instructions conveyed in the telegram, ought to be well on his way to Whitcastle.

On arriving at the cottage, Evan pulled up in front of it and called out 'House! house!' as he had heard the carrier do the day before. There was more delay to-day than there had been then in answering the summons, and it was not till after he had repeated it, and had then waited while stock was being taken of him through the window, that the door was opened by a tall thin girl with very bright black eyes and a crafty but somewhat sullen expression of countenance. This must be Abrey's grand-daughter Elsie, Evan told himself—the 'impish girl' of whom Edeline had made mention to him. The fact that she had answered his summons, and not her grandfather, was all but proof positive that the latter had left home in response to the telegram.

By this time Evan had alighted, and was patting the neck of his horse. Elsie, standing on the doorstep, her bright suspicious eyes fixed on him, waited to hear why he had summoned her.

'My good girl, I am in want of a truss of hay,' began Evan, in his easy debonaire manner, as he proceeded to draw off his gloves. 'I have heard Mr Abrey's hay very highly spoken of, so have made up my mind to try it.'

'It is very good hay, sir, I believe,' answered Elsie. 'I will fetch you a truss from the shed.'

Carefully shutting the cottage door, she turned in the direction of the shed, which was some dozen or more yards away.

'By the way,' went on Evan, following her up in leisurely fashion, 'I see that Mr Abrey deals

also in corn. You may as well let me have a sample to take with me. I may be able to find him a customer or two among my friends.'

'Very well, sir; I will give you a sample,' responded the girl.

Evan began to whistle, as though everything had been said which need be said.

On reaching the door of the shed, Elsie turned the big key in the lock and went in. The interview between Abrey and the carrier of which Evan had been a witness the day before had inspired him with the idea which he was now endeavouring to put into practice. Still whistling softly to himself, he strolled after the girl till he reached the open door of the shed. One glance round the interior was enough. Its only window was in the roof, its only door the one by which he was standing. Elsie had already selected a truss of hay from a heap which half filled the shed, and had crossed to a bin in one corner in order to take from it a sample of corn. Now was Evan's opportunity. An instant later the door was shut and locked. As the bolt shot home, a shriek broke from the girl. Again and again she dashed herself against the door, and shook it in a frenzy of rage and fear, although she must have recognised the utter futility of such efforts as she could put forth to force the stout old timbers. She might hurt and bruise herself as much as she chose, but it would be to no avail.

A few swift strides took Evan to the cottage. Without a moment's hesitation he opened the door and went in, and at once found himself in what was evidently the living-room of the family. Its only occupant was a worn-looking gray-haired woman, who was seated in a large cushioned chair by the chimney corner. Evan knew at once that she could be none other than the Ann Abrey of whom Edeline had told him, she who had lost her speech, as also, in a great measure, the use of her limbs. His first glance had been round the room in search of the missing child, if haply he might be there; then he turned to the invalid, and their eyes met. In the way she looked at him he read the amazement and fear which his sudden appearance, and without the girl, had given rise to in her mind. It was no part of his plan to frighten this poor creature, and he hastened to reassure her.

'You have nothing whatever to be afraid of,' he said. 'I am not here either to rob the house or to do you any harm.' Then a sudden thought struck him. 'You know Miss Fenton, who often comes to see you?' he asked.

The eyes lighted up, and the expression of the drawn features changed in an instant. The reply was a vigorous nod of the head in the affirmative.

'You like Miss Fenton, do you not, and would do almost anything for her?' continued Evan; to which the reply was a still more emphatic nod than before. 'It was Miss Fenton who told me about you. In a little while she and I are to be married,' went on the young man. 'But she is in great distress and trouble owing to the loss of my cousin, little Frank Marchmont of Rothwell Chase. Now, I have reason to believe that the child is hidden either under this roof or somewhere close by; so, if you really care for Miss Fenton as you give me to understand that

you do, you can prove it at once by telling me how and where I can find the boy.'

He had spoken very slowly and distinctly, but scarcely had the words passed his lips before the full force of their absurdity struck him. For the moment he had forgotten that he was preferring his request to a speechless woman. He bit his lips with vexation.

He could see that Ann had understood what he had said. For the space of a few seconds her eyes rested searchingly on his face, then, as if satisfied with her scrutiny, she pointed with her right hand—the one of which she still retained the use—to an object hanging on the wall a little distance away. It was an ordinary school slate. Evan gathered her meaning at a glance.

Taking down the slate, he placed it on a small oval table by Ann's elbow. Then, having produced a piece of pencil from her pocket, she began to write, slowly and laboriously, Evan steadying the slate for her meanwhile. When she had finished her sentence she looked up at him, and he, stooping forward, read: 'Swear to me that you are speaking the truth.'

Evan drew himself up, and lifting his hat, said: 'I swear most solemnly, in the sight of Heaven, that what I have told you is the truth!'

Ann nodded and motioned that she had more to write.

'Light that lantern which hangs in the corner,' she wrote. 'Take it with you, and go down into the cellar. There you will find a door. Open it, and pass onward till you reach the cavern. There you will find the child.' She laid down the pencil and looked up at Evan, as intimating that she had done.

Evan's heart gave a great bound as his eyes took in what she had written. 'God bless you! You are a good woman,' he exclaimed fervently. Then he took down the lantern and lighted the candle in it from his own match-box. Ann's finger indicated to him the door which led to the cellar. Opening it, he went down a flight of stone steps which landed him in a gloomy apartment that seemed to extend under the whole of the house. Presently he found the door he had been directed to look for. It was of rude construction, consisting merely of a few boards loosely fastened together by means of three or four cross-pieces, having neither lock nor bolt, but merely a simple latch, which, however, was placed so high up as to be out of the reach of a child of three or four. Near at hand was a heap of bricks, as though what lay beyond the cellar had at one time been walled up and only lately reopened, which, indeed, on after investigation, proved to be the case. On opening the door and going forward, Evan found himself in a narrow passage between six and seven feet in height, where, but for the lantern he had brought with him, he would have been in total darkness. Pressing forward carefully, with the light thrown in front of him, the passage gradually sloping downward the while, he came presently to a curtain of faded moreen, on pushing aside which he found himself on the threshold of a cavern of considerable size, but whether natural or artificial he had neither time nor inclination just then to determine. For the moment, indeed, he saw one object, and one only: a child, pallid-cheeked and large-eyed, seated on

a truckle bed and silently turning the leaves of a picture-book by the light of a lamp fixed against the wall over his head. In one corner an oil-stove was burning, probably with a view of raising the temperature of the cave, which, however, was by no means unpleasantly cold. A small table, a couple of rush-bottomed chairs, and a few other articles of common furniture, were scattered about. The height of the cavern varied in different places, but nowhere could it have been less than from twenty to thirty feet.

After a momentary pause, Evan let the curtain drop behind him, and putting down his lantern, advanced smilingly towards the bed. He was afraid the child might be frightened at the sight of a stranger, for the two had never met before. 'Frankie,' he said, adopting the name Edeline often spoke of him by, 'I have come to fetch you. Your mamma and grandpapa want you at home again, and you want to see them, don't you?'

'Yes; we want to go home again vewy much,' responded the little fellow, after regarding Evan for a moment or two with his grave old-world eyes, as if the coming of the latter were quite a matter of course. 'Me dweadfully tired of this pwace. Me want to see Edie and Fanny and gwandada again. Me quite weady to go.' With that he shut up the book and slid from the bed to the floor. There was one thing to be said for those who had been his jailers for so long a time—he had suffered no neglect so far as cleanliness was concerned, and but for the pallor resulting from the want of daylight and fresh air, he looked in fairly good condition.

There was a knitted shawl hanging over a chair, which Evan took the liberty of appropriating, and proceeded to wrap it round the boy. While thus engaged his eyes were attracted to an accordion on a shelf close by, and the origin of the mysterious music was at once made clear to him. It was doubtless the girl Elsie whom he had heard playing, the sounds reaching him faintly through cracks and crevices in the roof of the cavern as he lay stretched on the grassy slope overhead.

Ann Abrey's eyes brightened when, three minutes later, Evan emerged from the cellar with Frank in his arms. Slate and pencil were again brought into requisition. 'Please give my love and respects to dear Miss Fenton,' she wrote, 'and beg of her not to forget poor Ann Abrey.'

Evan, with his hand grasping hers, told her he knew Miss Fenton far too well for there to be any fear on that score. Outside he found his horse and trap as he had left them. All was quiet in the fodder shed. Elsie was awaiting in sullen patience the return of her grandfather, or the passing of some one who, in response to her calls for help, would set her at liberty.

It was with very mingled feelings that Evan Marchmont rang the bell of the main entrance to Rothwell Chase. Hitherto, through no fault of his own, he had been, so to speak, an outcast from the home of his ancestors. While he awaited the opening of the door, the whole scene of his interview with his uncle a year before flashed as freshly across his memory as though it had been an incident of yesterday. Again Sir Harry's cruel words seemed to smite him like a lash: 'I would rather my ward should marry yonder crossing-sweeper than marry you.' To-

day, however, the whirligig of time had brought about Evan's revenge. It would cut the proud old man to the quick to have to be indebted to the nephew whom he had insulted and treated with such contumely for the restoration of the missing heir—the hope, the pride, and the joy of his declining years. Evan at that moment would have been more than mortal if the thought—all unbidden though it came—had not found an echo in his heart: 'But for the child I am now bringing home, I should one day be the master of Rothwell Chase!'

'Show me to your master's room,' he said to the footman who had opened the door, and now stood staring at him and his burden in blank bewilderment.

The man, without a word, led the way to the study, where, of late, Sir Harry was nearly always to be found at this hour of the day. With him was Edeline.

As Evan entered the room, still carrying the child, who, however, was no longer swathed in the shawl, Edie sprang to her feet with a cry, while Sir Harry rose stiffly from his chair and, trembling in every limb, stared as though he beheld some vision from the tomb.

'Sir,' said Evan in ceremonious accents as he put down the child, 'it is possible that you do not recognise me. I am your nephew, Evan Marchmont. Permit me to have the happiness of restoring to you your grandson—and heir.' With that he bowed gravely, and turning, would at once have left the room had he not found the way barred. While he was speaking, Edie had glided forward, and was now standing with her back to the door.

'Gwandada, I'se come back to you,' said Frank as he ran forward and clasped the old man round his knees; 'and me won't go away from you never no more.'

On the scene that followed it is not needful that we should dwell, and what still remains to be told must be set down as briefly as may be.

A warrant for the arrest of Sampson Abrey was at once issued; but when, early next morning, the police went in search of their man, he was nowhere to be found. He had decamped in the course of the night, taking Elsie with him, and neither of them was ever seen in those parts again.

But Samp Abrey was not the only one missing when asked for. Within an hour of its becoming known at the Chase that Master Frank had been found and brought home by a strange gentleman, both Therese Cobran and Tom Abrey disappeared, and there being nothing at the time beyond suspicion to connect them with the abduction of the heir, no efforts were made to trace either of them. Next morning, too, it became known at the Black Swan that the mysterious Mr Vodney was *non est*. He had apparently retired to his room as usual some time after midnight; but instead of doing so, he must have slipped out of the house unseen by any one, and so have vanished, probably in the direction of the railway station, leaving, however, owing to some little oversight on his part, a fortnight's bill unsettled for bed and board.

An examination of Marshmallow Cottage and the secret cavern with which it was connected left no room for doubt that the latter had been

utilised in years gone by for the storage of contraband goods, but that, when smuggling ceased to be a profitable game, the entrance had been walled up, and had so remained till Sampson Abrey found a use for it such as had never been dreamt of by his respected progenitors.

Abrey had made no attempt to burden his flight with his helpless sister. The baronet and Miss Fenton between them charged themselves with the future of the poor woman, for whom a home was found where she would be duly cared for.

Sir Harry's reversal of feeling towards his nephew was that of a prejudiced and obstinate but at the bottom kind-hearted man, who all along had been possessed by an uneasy consciousness that he was in the wrong, while too stiff-necked to acknowledge it even to himself. Now that it had been brought about, it was a reversal full and complete; had it not been so, it would not have been in keeping with the man as he was.

Evan and Edeline were married about six months after the occurrences herein narrated. A few weeks later Mrs Marchmont was also married, not, however, to any rich Englishman or noted personage in London society, but to a certain Signor Luigi Castanelli, the one man in the world of whom she went in fear, who had found her out, as she had always had a presentiment he would, and whom she accepted, feeling sure it would be as much as her life was worth to refuse him now she was free, after the way she had led him on and then thrown him over five years before.

There were several features in connection with the abduction of the heir which still remained inexplicable to Evan and his wife, and, for anything they could see to the contrary, seemed likely to remain so till the end of the chapter. But when three years had gone by, enlightenment came, and that in a way the most unexpected.

On a certain afternoon Mrs Evan Marchmont's servant informed her mistress that there was a female dressed in deep mourning at the door who desired to speak with her, but refused to give any name.

The stranger proved to be Therese Cobran—but how changed! Edeline was more shocked than she would have cared to express in words.

'I must crave your pardon, madame, for venturing to call upon you,' began Therese in the same cold unmodulated tones which Edie remembered so well; 'but if my necessity were not a very bitter one, you may rely upon it that I should not be here to-day.'

'Sit down, and let me offer you a glass of wine before you say any more,' answered Edeline, whose sympathetic nature had at once been touched by the evident forlornness of the woman. And then she wore a widow's cap, which of itself was enough to touch Edie to the quick; and her mourning was very, very shabby.

The story she had to tell, which must be here abridged, was both a sad and a strange one.

Vodney had been her lover, and subsequently her husband, and his was the brain which had planned the abduction of the heir of Rothwell Chase. Therese and he had been engaged for some years; but Vodney was still so poor that

the prospect of their marriage seemed as far off as ever. He had tried half a score ways of making a living, but had failed in all. It was while matters stood thus that Mrs Marchmont one day in a moment of passion struck Therese on the cheek with her slipper. The Swiss resented the indignity bitterly in her heart, although at the time she seemed to pass it over lightly and to have forgotten all about it a few hours later. What was perhaps more to the purpose, her lover resented it, or pretended to do so, equally with herself. Then it was that he proposed to her a scheme for the abduction of the heir, which, if it could only be successfully carried out, would serve a double purpose. In the first place, it would give Therese the revenge she was longing for, in the mother's agony and distress for the loss of her child; while, in the second place, if Vodney could only contrive to be the medium for the restoration of the child, he could claim the reward which would doubtless be offered, and thereby at once remove the only obstacle to the marriage of himself and Therese. It was a scheme which at first sight bristled with difficulties, but Vodney's indomitable patience sufficed to overcome these one by one.

Tom Abrey, from the first day of Therese's appearance at the Chase, had fallen madly in love with her, little likely as she seemed to excite such a passion in the breast of the good-looking groom, who could have had the pick of a score pretty girls, as he was quite aware. However, so it was. Vodney, when informed of Tom's infatuation, at once proposed to turn it to account for the furtherance of his scheme, and Therese was instructed to afford him a certain amount of encouragement, and so lead him on to talk of this, that, and the other. Among other family matters which Tom in the fullness of his heart confided to Therese was the fact that, some twenty years before, his grandfather had undergone a sentence of penal servitude for being concerned, with others, in a poaching affray in which one of Sir Harry's keepers was unfortunately shot. Since that time, for some reason known only to himself, old Abrey had nursed a bitter grudge against the baronet, and had often been heard to declare that he should not die easy till he had had his revenge. Here was a tool to Vodney's hand! The old man was accordingly approached through his grandson, who, to do the young fellow justice, had no liking for the job, but was led on by his mad passion for the waiting-woman to do things which at another time he would have turned from with abhorrence. The end of the matter was that old Abrey agreed, for the sum of fifty pounds, to be paid in two instalments, to take the child into hiding for a month, at the end of which time some one was to fetch him away, and Abrey was to be no more troubled in the affair. The some one in question would have been Vodney, who, in his sham rôle of private detective, would have taken the child back to Sir Harry—after first obtaining from him a written promise that no further inquiries should be instituted—and have claimed the reward. To what extent this precious scheme was successful, and by what means it ultimately came to grief, we have already seen.

One point remains to be elucidated for the reader's behoof—to wit, by what means the child

was spirited away from the Chase without any one save those concerned in the plot being a bit the wiser. When Fanny Dale quitted the nursery in order to take Mrs Marchmont her cup of tea, Therese, who was on the watch, darted downstairs and, entering the room, said to Frank: 'Your mamma has sent for you, darling. I am to take you to her.' With that she took him up and hurried back with him to her own room, having first flung wide the window. There she offered him a narcotic to drink which had been supplied her for the purpose by Vodney. It was not at all disagreeable, and Frank, who was one of the most obedient of children, made no difficulty about swallowing it. Five minutes later he was in a sleep so sound that it would have been next to impossible to awake him. For the time being she laid him to rest on an impromptu bed in a large clothes-closet which opened out of her room. But it was not till long after midnight that she found an opportunity of passing the still unconscious child into the charge of Tom Abrey, by whom, in turn, it was handed on to Elsie, who was waiting in the shrubbery, her grandfather, with his horse and trap, lying perdu just beyond the precincts of the park. To Tom Abrey, although the suggestion emanated from Vodney, was due the heel-marks under the nursery window which Mr Dinwade examined so carefully by means of his magnifying glass.

Despite their want of means, Therese and Vodney had got married. All the woman's savings had gone towards satisfying old Abrey, Vodney making sure that he should presently get the amount back from Sir Harry under the head of expenses. About six months after her marriage Therese had come in for a legacy of two hundred pounds. This had proved the ruin of her husband. In two years he succeeded in drinking himself to death; and now his widow had come to beg sufficient money to enable her to join some relatives in America. It is enough to say that the money was found her.

IN LYONNESSE.

THE extreme south-western corner of England, locally known as Penwith, and stretching from St Ives to Penzance and Land's End, is a tract as interesting as it is unfamiliar to the majority of Englishmen. It is a land of striking contrasts. Broadly speaking, a desolate promontory, it is bathed in the warm vapour of the Gulf Stream; and while one is everywhere confronted by barren hills crowned with piles of gray, time-worn rocks, each valley is, on the other hand, a garden where fruit, flowers, and vegetables grow with a luxuriance unknown farther north. A wilder and bolder coast could scarcely be imagined; but on the very edge of beetling crags hedges as trim as any in Kent line gardens whose produce pours into Covent Garden in the early spring. Here are heights where magnificent groups of rhododendrons flourish beside gorse and bracken; there, mine-shafts pierce precipitous cliffs, the smoke of the engines often mixing with the ocean spray; and the hum of industry is heard on pixy-haunted commons and amid granite monuments of ancient peoples. Such is

'Dark Bolerium, seat of storms,' the home of those Arthurian legends which

Gleam through Spenser's elfin dream,
And mix in Milton's heavenly theme,

as well as inspiring the pen of the greatest poet of our own age.

That these legends should have found a home here is but fitting, for Penwith may be called the antechamber of the fabled Lyonesse, which is supposed to have extended from Land's End to the Scilly Islands, twenty-five miles away. 'Morning had dawned upon as bright a scene as ever met the eye. At evening there was nought from Land's End to St Martin's Head but a howling and boiling wilderness of waves, bearing here and there upon its bosom a fragment from the perished world below, or a corse tossed upon the billows, over which seabirds wheeled and screamed.' And some say that often as the Mounts Bay fisherman turns homeward

When the clear calm eve's declining,
He sees the gray towers of other days
In the waves beneath him shining.

These are but pretty fictions, geologists having proved the impossibility of any such convulsion; but a person standing upon an elevated part of the Land's End promontory when the summer sun is setting behind the Scilly Isles, which stand out against the red disc like cloud-castles, and the intervening stretch of water is wrapped in a ruddy glow, might easily fancy that below lay a region 'mystic, wonderful.'

Little more than thirty years ago Scilly was *terra incognita*, its only means of communication with the mainland a little sailing-vessel which crossed to Penzance at irregular intervals. A visit to England was to the islander the event of a lifetime, and only tourists of an adventurous class sought its remote shores, which letters or newspapers rarely reached, and where they might be weather-bound for weeks together. Now, a fast train places Penzance within nine hours of London; and a powerful steamer, which runs several times a week during the summer, traverses the remaining forty miles in about three hours. The consequence of these increased facilities for travelling is that young Scilly makes one or two excursions yearly to Penzance or Plymouth, going even to London occasionally; and each succeeding summer sees a larger number of tourists in the islands.

The Scilly Islands, which are supposed, on the very slenderest of foundations, to be the Cassiterides of the Greeks, receive casual references from various old writers; but they are not mentioned in Doomsday Book; and except during the war between Cavaliers and Roundheads, when the islands were for some time the chief royalist stronghold in the west, they have played but a small part in history. The monks of Tavistock obtained the group from Henry I.; and four centuries later, upon the dissolution of the monasteries, they were divided among various owners, who were in turn bought out by Elizabeth; and since then, Scilly has been an appanage of the Duchy of Cornwall. Elizabeth, however, granted a lease of the islands to Sir Francis Godolphin, the head of a powerful Cornish house which had done the Crown good service, and which subsequently obtained the dukedom of

Leeds. The Godolphins retained the lease until 1830, but then gave it up; and it was acquired four years later by Mr Augustus Smith, a Hertfordshire gentleman, and member of parliament for Truro, whose powers as lord-proprietor have passed to his nephew and heir, Mr Dorrien Smith.

Lying far out in the western sea, exposed to the unbroken force of Atlantic storms, the coast necessarily is bold; and it bears evidence everywhere of constant conflict with the elements. How fierce that conflict is in winter, the summer tourist can scarcely form any conception of, though even then there are reminders of it. When the sun is brightest, let but a light breeze spring up, and within an hour the sea boils among the outlying reefs.

But even here there are days when the sea shows a perfectly unruffled face, and kisses the sand with a languorous murmur, tempting the most timid to boating excursions as far as the adjacent islands. Each of these possesses objects of interest. There are barrows for the antiquary, rare birds and plants for the ornithologist and botanist, and scenes worthy of a painter's brush. St Martin's beaches have a rich store of dainty shells; on Tean a breed of white rabbits flourish in security; and on Annet half-a-dozen kinds of seabirds will hover round while you examine the eggs of the dotterel, tern, or petrel lying on the sand, or extricate your feet from one of the tunnels in which the less confiding shearwater deposits her charge. But he who seeks rest alone will find plenty to charm without leaving St Mary's, which is the principal island, and contains a population of twelve hundred, or two-thirds of that of the whole group.

Passing beneath the massive archway of the castle which Elizabeth erected for the protection of her subjects of Scilly, he will in a minute or two reach a down overlooking the whole archipelago, and strolling breast-high between lines of yellow gorse, almost touch with his foot the rabbits which at every step dart across the path. Turning in another direction, he may in an equally brief period be standing among cyclopean rocks of fantastic shapes, 'gray as the handle of the scythe of Time,' their huge heads towering above the sea, crowned with ruby lichens and clumps of purple-flowered grass, and hiding in their crevices the dark green fronds of the 'Asplenium marinum.' A pair of sandpipers perhaps flit among the wave-washed stones below; on a flat rock a cormorant opens its wings to catch the sun among half a score of apparently dozing comrades; some black-backed gulls are slowly circling in front; and from the moor behind, with the perfume of chamomile, comes the shrill cry of the curlew. Or, leaving the coast, he may ramble past picturesque thatched cottages, their fronts hidden by geraniums and roofs topped by nodding palms—past banks glowing with the brilliant scarlet clusters of the 'crassula'—past gardens of unsurpassable neatness, where thrushes and blackbirds swarm unchecked, and flocks of sparrows hold noisy convalescence—past homesteads almost covered with foliage, where fowls nestle among clumps of bamboo, where the dust-heap is hidden by hydrangeas, and gumtrees and tamarisks of the South afford shelter to the duck-pond.

However short his stay, every tourist visits the gardens of Tresco Abbey, the residence of Mr Dorrien Smith, the 'Lord of the Isles'; indeed, many persons cross from Penzance for this purpose only, and having seen Tresco, turn their backs on Scilly, satisfied with their journey. The house, a large castellated building—rather unattractive in itself—stands among immense rocks, upon the site of the ancient abbey, whose ruins draped in ivy form a picturesque addition to the mansion. The most striking feature of Scilly is its luxuriant vegetation, and this is seen in its greatest perfection in these gardens. Within the fourteen acres which they comprise there are comparatively few plants familiar to English eyes, and these reach a quite prodigious size, the fuchsias, for instance, rather resembling forest trees than shrubs. The bulk of the specimens are exotics, and generally tropical or subtropical. Ferns are there from the antipodes, palms from China, the prickly-pear of Mexico, and the bamboo of Japan. The largest eucalyptus in the British Islands is pointed out to you, as is the only 'Puya chilensis' which an English gardener has succeeded in inducing to flower. Huge aloes shoot their flower-stalks, straight and stout as young pines, twenty feet or more upward; and on the rocky slopes the delicate mesembryanthemum thrives. It would be impossible in a limited space to do justice to the marvels of Tresco gardens, but it may be briefly said that nothing to at all compare with them exists elsewhere in Great Britain. Of course, this is mainly due to favourable climatic conditions; but part of the result has been obtained by unremitting labour and the expenditure of large sums by the late and present lessees.

The play of Hamlet without the Prince were not more imperfect than a paper on Scilly which omitted to refer to Mr Augustus Smith's connection with the islands and the work he has done there. The Godolphins rarely visited Scilly, and took very little interest in this part of their estates; but as soon as Mr Smith obtained the lease, he settled down on the island of Tresco, and entered actively into everything connected with his 'kingdom.' He likewise instructed his heir, then a cavalry officer, to spend eight months a year at Tresco, and to contribute various sums, amounting to nearly one thousand pounds per annum, towards educational and religious objects.

Mr Augustus Smith's labour has not been in vain. Previous to his accession to power, the normal condition of the people was one of poverty and ignorance, most of the inhabitants living in squalor on miserable plots of ground, and all depending largely for a livelihood on smuggling and shipwreck. Mr Smith raised their standard of comfort, forced education upon them, and while teaching the young men ambition, sent them into the world armed for life's struggle. He encouraged the farmers in the culture of early potatoes, which became the staple trade for many years; and when he saw disease and foreign competition injuring this, he showed them by his own example how flowers might be made a source of profit. *L'état, c'est moi*, Louis Quatorze is reported to have said; and Mr Smith might say, 'I am Scilly.' As tenants-at-will, the two thousand inhabitants of the islands are quite at

Mr Smith's mercy; he is the chairman of every local body; and the imperial Government has lately recognised his authority in a very unusual manner. By an Act of Parliament passed last year, the islands obtained, on the 1st of April 1891, in lieu of a vestry, a County Council, composed of four aldermen and twenty councillors; and of this elective body the lessee or his nominee is appointed chairman until 1914, when his lease expires. Whether such great power on the one hand and complete dependence on the other be morally wholesome is open to question; but it is at least creditable to Mr Dorrien Smith that no potentate ever had more contented and devoted 'subjects.'

Though there are still perhaps two thousand tons of potatoes annually exported from Scilly, their place as the chief industry has been taken by flowers, and the islands are now the lily-garden of England. The farmers hesitated long before adopting what they regarded as a foolish 'fad' of Mr Augustus Smith's; but the most conservative soon saw that bulbs could be made remunerative, and every successive year sees a greater quantity of land given to their cultivation. It is not many years since the export was limited to a few boxes per week; but during the last season a single steamer has conveyed as much as fifteen tons, representing about three thousand packages, to the London, Birmingham, and northern markets. At first the growers limited themselves to the daffodil and one or two common kinds of narcissus, which grew wild on every sunny bank; but now they ransack Southern Europe for rare varieties, and often give as much as a pound for a single bulb. Indeed, occasionally five guineas have been paid for one.

Before us lies one of the most intelligently managed, though by no means one of the largest gardens in Scilly. It comprises six acres, and is enclosed by a leafy wall of laurel, euonymus, and escallonia, about twelve feet high and four wide, which forms an effective barrier against storms. This oblong space is divided into small plots by lower hedges of such pretty flowering evergreens as veronica and 'Escallonia macrantha.' In one plot will be found wall-flowers; in another, stocks; a third may blaze with the scarlet of the 'Anemone fulgens;' and a fourth be turned into a golden sea by the prolific 'soleil d'or.' The sides of the patches hold marguerites as tall as a grenadier, and in odd corners shine the gorgeous gladiolus and tiger-lily. These are the principal flowers of commerce; but there are many other plants here which are prized for their rarity, beauty, or smell, such as the New Zealand flax, several exotic myrtles, and the Australian musk-bush.

The Scilly farmers are of course obliged for the sake of their live-stock to grow corn and root-crops; but their best energies are given to the flowers, which well repay the trouble expended. It is impossible to give accurate figures respecting a trade which is in a more or less experimental stage, and of which the profits vary very much. After the first cost of the roots, there is but little expense. Beyond an occasional application of seaweed, the bulbs practically require no manure; they remain undisturbed in the ground for three years, flowering every season, and have then mul-

tiplied on an average sixfold; and the flowers realise from twopence to two shillings per dozen, the return per acre varying from forty to two hundred pounds. It will be seen even from these meagre details that 'there is money in bulbs.' Necessarily, there are difficulties and risks of loss with so delicate a commodity as flowers. Their value mainly depends upon the early period at which they can be put upon the market, and every week of delay causes an appreciable loss. A cold spring is therefore disastrous. Wet weather, again, by preventing the flowers from being packed in a dry state, often causes the ruin of a consignment; or the whole of one picking may be lost by an endeavour to keep it until prices go up; or a lot of expensive bulbs—and these are the most delicate—may die through ignorance of their peculiar requirements. But, on the whole, flowers are a veritable mine of wealth to Scilly, and thanks to them, the islanders are far better off than they ever were before. Ominous rumours are abroad of the adoption of forcing-houses by the rival growers of the Channel Islands; and it is quite possible that the Scillonians may be obliged to follow the example. In that case, more capital would be required; and if a higher price could not be obtained, profits would suffer a serious diminution.

The flower season lasts from January to June; and Scilly to be seen in its glory should be visited in the spring. At that time, St Mary's, which is the principal flower-growing island, resembles a large piece of brilliant patchwork; the air is filled with perfume, and almost every person on the island is engaged in plucking, trimming, or packing. The flowers are plucked on a fine day just before they have opened, and taken to a damp room with a temperature of about seventy degrees; then every vessel which will hold water is requisitioned, and in these the blooms, after having the superfluous leaves carefully removed, are placed until the time for packing comes. This operation is deferred as long as possible, perhaps for a couple of days after picking, and meanwhile the boxes and baskets are prepared with soft layers of hay and ferns, and labels and cord are got ready, as well as dainty coloured paper with scalloped edges for the more expensive flowers. At length the final stage is entered upon, perhaps at midnight, and for hour after hour there is no cessation, one person drying the stems, another tying into bunches, another packing, a fourth nailing up, and a fifth perhaps helping generally. On and on into the gray morning the workers toil in an atmosphere which the heat and the odour of tens of thousands of flowers have made almost insupportable, gradually building around themselves a wall of neat packages, their movements growing feverish as the sound of passing wheels reminds them that their neighbours' flowers are already on the way to market. At last the task is over; the horses move off with their load, and take a place in the line of vehicles which every highway is discharging on the pier; and ere the weary 'flower-farmers' have well finished their hardly-earned breakfast, a shrill whistle announces the departure of the steamer. At Penzance, a special train is in waiting to convey the beauty and perfume of Scilly to busy centres, there to decorate the

tables of the wealthy, to brighten the gloomy chamber of the invalid, and to speak words which the timid tongue of the lover hesitates to utter.

THE MONTH:

SCIENCE AND ARTS.

ACCORDING to a Report recently laid before Parliament by the chief inspector of alkali-works, it would seem that the manufacture of salt in Cheshire is still carried on in a very primitive manner. The brine pumped from the dissolving rocks below the earth's surface is heated in huge iron pans, which are about the dimensions of an ordinary swimming-bath, say sixty feet by thirty feet, but which are only two feet in depth. Here the salt crystallises as the mother-liquor slowly evaporates, and from time to time is removed by rakes and shovels. Some salt or pan-scale, however, is always left, and this caking on the metal causes the iron plates to bend and burn. So the vessel quickly becomes leaky, and the brine drops on to the heated brickwork below, where it forms huge blocks of salt; while some of it is carried away as salt vapour in the smoke. In this way the smoke from the salt-works is often charged with sulphurous acid, the vapour of volatilised salt, hydrochloric acid, and steam; and such elements in the atmosphere have a very prejudicial effect on the surrounding vegetation. Great good has resulted, we learn, since the limit fixed by the Alkali Act for the amount of acid in the chimney gases of alkali-works has been adopted for salt-works. Manufacturers are now more careful about leaky pans, and a saving is effected all round.

The important question of establishing electrical communication between coastguard and life-boat stations, lighthouses and lightships, and the general telegraphic system of the country, has again been opened by an influential deputation to the Board of Trade. This deputation were able to strengthen their case by pointing out that in the case of one wreck at least—that of the *Schiller*, which was lost close to the Bishop Light-house—three hundred lives might have been saved if communication with the neighbouring coast had existed. They were also able to show that other countries—France, Denmark, Norway, Holland, Sweden, and the Cape—had long ago adopted the system which they advocated. For four years the *Sunk* lightship on our eastern coast was in telephonic communication with the shore, and this experiment was discontinued, it is said, 'as really having been of no service.' If, unhappily, a wreck had occurred near the lightship during that period of four years, this typical official reason for bringing the experiment to a close would possibly have been considerably modified.

That useful body, the Society for the Protection of Ancient Buildings, held the other day its fourteenth annual meeting in one of the most curious and most ancient halls in London, that of Barnard's Inn, Holborn, when an interesting paper was read by Mr W. B. Richmond, A.R.A., on 'The Impossibility of Restoration.' In the course of this paper the lecturer pointed out that restoration was a fallacy, and was as futile as an attempt

to bring history back to life again. To arrest the progress of decay was all that the preserver would presume to do; but the destroyer would attempt to restore. What had been already filched from British architecture could never be replaced. War and men's passions had done their worst to rid the world of treasures; but so-called restoration had indeed done nearly if not quite as much, and had left the country well nigh bare of her finest monuments. We are not inclined to adopt this pessimistic view of the present state of our monuments, and may trust to the genius of modern architects to rear for us buildings worth looking at.

Locusts have for some time done much mischief to the green crops in Morocco; especially do they damage the olive and almond trees, so that the fruit has often to be gathered hurriedly and before it is really ripe. No drastic measures are taken against the advance of the enemy, such as we read of in the case of Cyprus and Algeria; indeed, it would seem that the plague is not altogether evil in its incidence; for the natives use the locusts as food, neither Jew nor Mohammedan regarding them as 'unclean.' They are carried to town by the sackful, and after being boiled in salt and water, are fried or parched. The idea of using such creatures as food is repulsive to most Europeans; but those who have tasted the locusts experimentally compare their flavour to that of prawns.

Every now and then, when building operations are going on in the heart of the City of London, and when the value of space causes the excavators to dig deep for the creation of cellarage, the workers come upon buried 'Roman London.' Such was the case the other day when a house was pulled down at Cornhill, fragments of mosaic pavement and bits of Roman pottery being found in abundance. Perhaps the most interesting find of all was the discovery of the bed of a small river some twenty feet below the surface, whose waters must have ceased to flow many centuries back.

An improved process for making artificial silk is said to have been patented in Paris; but the method adopted seems to be of rather a complicated nature. The raw material is a mixture of pyroxylin, acetic acid, isinglass, and gutta-percha in bisulphide of carbon. The threads made from this mixture are passed through several different baths before they assume the appearance of silk. Another process for the manufacture of real silk direct from the mulberry tree without the intervention of the silkworm is reported from the United States; but the story savours rather too much of the Munchausen type to be taken without the proverbial grain of salt.

It is a matter of common knowledge that the best tea from China finds its way to Russia, and seldom reaches Great Britain. A recent Consular Report from Hankow informs us that a great deal of tea for the Russian market is exported in the form of tablets, and is known as 'tablet tea.' These tablets are made of the finest tea-dust procurable, which is selected by experts. This dry dust, about two and a half ounces at a time, is placed in a steam-mould, and a pressure of about two tons is brought to bear upon it, with the result that the tea is compressed into a flat hard cake. These tablets are carefully packed, first in tinfoil, and then in coloured wrappers,

after which they are placed in the lined packing-cases for export to Russia. By this process the tea loses five-sixths of its bulk, while its flavour is in no way injured. The consul thinks that it would be worth while to supply our army with tea in this convenient form.

At the recent annual dinner of the Royal Meteorological Society, Mr G. J. Symons said that he had observed that meteorological observations seemed to have a wonderful effect in promoting longevity; and in proof of his statement, said that the average age of observers in correspondence with him was nearly seventy. As our readers probably know, there is a large army of private individuals who undertake such observations as a labour of love, and who regularly report to the central authority. We are glad to learn that the work is so conducive to long life, a fact which cannot fail in securing many others willing to make records on such favourable terms.

In March last we were all shocked by the news that a large ship of the 'Anchor' line had been sunk at Gibraltar, in consequence of a collision with H.M.S. *Anson*, with the loss of several hundred lives. The vessel in question was the *Utopia*; and a few minutes after the accident she was resting at the bottom of the sea in a depth of seven fathoms. But in these days of wonderful engineering, a ship in such a position is not regarded as lost beyond recovery. By enclosing the vessel in a huge wooden tank lined with canvas, and by the employment of powerful pumps, the *Utopia* within four months of the disaster which sent her below water was raised and beached, and she will probably once more resume her transatlantic voyages. The work has been cleverly carried out by a Scotch firm, the East Coast Salvage Company, under the direction of Mr Arnitt.

The explosion of the boiler of a tramway engine at Huddersfield, which resulted in loss of life to one and injury to many, recently formed the subject of inquiry by the Board of Trade, when the accident was traced to a somewhat unusual cause. It was shown in the course of the inquiry that the water used for the boiler had a corrosive action upon the plates of the boiler, a result which could hardly have been unexpected, for it was known that the water employed contained a good deal more than a trace of free sulphuric acid. An alkaline composition was put into the water to neutralise the action of the acid, but this was clearly not enough to save the metal from gradual deterioration.

A limestone cavern, which is believed to be as large as the famous Mammoth Cave of Kentucky, has recently been discovered in Josephine County, Oregon. It has been explored for a distance of several miles, and has been found to contain many features of great beauty. Very few indications of animal life were found in the cave, and these only near its entrance in the form of a few bones, which showed that the place had been used as a den, probably by bears.

The Electric Railway which carries passengers from the heart of the Metropolis, under the Thames, and three miles beyond, is so successful in its working that several other enterprises of the same kind are under consideration. The Central London Railway has received the sanction of the legislature, and will now be rapidly pro-

ceeded with. Its engines are to be of three hundred horse-power—that is, three times as powerful as those in use on the pioneer line. The Elevated Railway in Liverpool is to be worked by the same agency. The most noticeable feature in the existing electric underground line is the great purity of the air in the tunnel. This is secured not by ventilation in the ordinary sense of the word, but by making the vehicles so nearly of the same size as the bore of the tunnel, that every train practically clears the tube of bad air and draws after it a fresh supply.

The sixth annual meeting of the Photographic Convention of the United Kingdom was held in July last in the city of Bath (Somerset), under the presidency of Mr W. Bedford. This useful Association meets, like its elder brother the British Association, every year in a different city, and its meetings are diversified by excursions to contiguous places. The recent Bath Convention had one excursion of special interest to photographers—namely, to Lacock Abbey, the home of Fox Talbot, and the place which most undoubtedly formed the subject of the first photographic picture taken in this country. Next year the Convention will meet at Edinburgh, a city where much pioneer work was done in the early days of photography.

A new amalgamator for the treatment of ores of the precious metals has recently been shown to gentlemen interested in mining and metallurgy at the works of the Atkins Amalgamator Syndicate, Millwall. The apparatus depends upon electrolysis for its action; and associated with it is a small dynamo machine, and a steam-engine, to give the necessary motion to that and other parts of the apparatus. A novel feature in connection with the machine is an arrangement of pump and strainer, by which the mercury employed is continually freed from amalgamated gold or silver, as the case may be, and is returned to its containing vessel in a clean state, so that it is always ready to arrest fresh particles of metal contained in the pulverised ore submitted to its searching examination. The apparatus works well, and possesses several advantages which should secure the careful consideration of the mining industry.

We too often read of death following the administration of chloroform, and many surgeons prefer to use ether or some other anæsthetic which has the reputation of being safer for the patient. It is believed that most fatalities of the kind are traceable to impurities in the volatile liquid, and hitherto it has been found next to impossible to manufacture chloroform which can be pronounced absolutely pure. M. Raoul Pictet has, it is said, discovered a means by which chloroform can be separated from any foreign matter which may be associated with it, and can thus be presented to the medical profession in an absolutely pure state. It will perhaps be remembered by many of our readers that M. Pictet's name is associated with one of the greatest chemical triumphs of the century—namely, the liquefaction of nitrogen, hydrogen, and oxygen, which before had been called 'permanent' gases.

Both in our own pages and in those of our contemporaries the danger of using arsenical colours in wall-papers and textile fabrics has

often been remarked upon, and one would think that manufacturers would for their own credit's sake insist upon the disuse of materials so prejudicial to the health of their workpeople and customers. But this is, unfortunately, not the case. Not long ago the British consul at Christiania, Norway, called the attention of the Foreign Office in London to the fact that, owing to so many of the fabrics imported there containing arsenic, British goods had earned a bad reputation in Norway, and a great decline in the quantity of such goods imported was the direct result. This complaint was forwarded to the Manchester Chamber of Commerce. Samples of the goods complained of were obtained and analysed, and it was found that the charge was only too well founded.

In order to show that the danger of handling and dealing with substances charged with arsenical compounds is no imaginary evil, we may mention that Dr B. L. Robinson, who for a long time has acted as assistant in the Grey Herbarium, Cambridge, U.S.A., has been compelled to resign his post for the sole reason that his health has become gravely affected through the arsenic with which dried plants are charged to preserve them from the attacks of insects, &c. The application of poison to the plants at this establishment is now to be given up, and other means relied upon to keep the specimens free from injury.

The civil war in Chili has given artillerists the opportunity of noting the terrible effects which can be wrought by that modern engine of war, the torpedo; for a fine steel-armoured vessel, of ten thousand tons register and three thousand horse-power, was only a few weeks ago sunk by the agency of one of these terrible contrivances. The torpedo was the only one of several which reached the unfortunate ship at which it was aimed, and although it was seen approaching, and a storm of projectiles was directed against it, it struck home. There was a tremendous explosion, and in a few minutes the vessel sank, and carried half her crew down with her.

It would undoubtedly be of great advantage to mankind in general, but especially to farmers, if rain could be made to fall just when required. Charlatans have arisen in all ages with the professed power to accomplish this end; but they may be classed with those who have wielded the divining-rod, and who have invariably failed to do anything of a supernatural kind when tested with proper safeguards against imposition. These considerations have not prevented the Government of the United States voting a sum of money for the trial of certain experiments in obtaining rain which are being carried out in an arid region in Texas, under the auspices of the department of Agriculture. The most hopeful idea seems to be that of exploding charges of dynamite at great altitudes, so as to break up any rain-clouds which may be in the vicinity. But it would seem futile to expect any good result unless the clouds are in that fully saturated state which portends a natural fall of rain.

Mr Campbell, of the British Consular service in China, gives, in a Report to the Foreign Office, an interesting account of a journey which he has recently performed in Northern Corea, during which he traversed districts never before visited by a European. It was known that gold

was found here, because of the frequent export of gold-dust from the adjacent ports; but Mr Campbell found that the gold-bearing strata were far more extensive than had been imagined. Imperfect native methods of mining the metal are resorted to; and it seems certain that with the introduction of improved appliances, the country would become one of the most important gold-producing areas in the world. Poverty and squalor are the present characteristics of the people, who suffer under an all-pervading official tyranny. Mr Campbell's paper also deals with the geography of the country, its agriculture, and many other features of interest.

A lecture of great interest to artists was recently delivered at Bedford College by Mr J. Norman-Lockyer, the well-known scientist. His subject was 'Physical Science for Artists'; and he pointed out how, for want of a knowledge of optics, colour, &c., artists were in the common habit of making serious and sometimes ludicrous mistakes in their pictures. He referred to several pictures now exhibited at the Royal Academy and elsewhere for examples of wrongdoing in this respect, and urged the necessity of artists including in their work a study of the common phenomena of Nature.

A good design for a rifle-range where space is limited, and where accidents might be feared from the near presence of houses, is described and illustrated in the *Scientific American*. This method prevents any bullet finding its way outside the range; so that the most erratic of marksmen could be safely trusted to practise rifle-shooting under such conditions. The range is provided with a number of sheet-iron guards of bracket shape (□), which gradually diminish in size from that placed close to the firing-point to that which is near the target. The marksman plainly sees the target, but through a number of open doors, as it were; and should his bullet miss the billet for which it is intended, it will strike the uprights or the vertical pieces of these iron doorways and do no harm. It need hardly be said that the height of these iron frames must be regulated according to the extent of the range, so as to allow for the trajectory of the bullet.

THE OLD SONG.

SING me the song that was often sung
In the olden time when we were young;
The ballad I mean with a soft refrain,
That told a story of joy and pain,
Of faith restored after doubt and dread,
And a love revived that was reckoned dead.
I remember the touch of a minor key
In a gliding passage of melody.

Yes, yes, that is it! Go on—go on;
I will close mine eyes till the song be done,
And fancy long years are only a dream.
Ah, the past the present again doth seem!
Shall you sing it once more? you gently say.
Perhaps to-morrow, but not to-day,
For the blinding tears that freely flow
The spell of the old, old song will show.

THE BATHS OF THE CURSED.

BY CHARLES EDWARDS.

HAMMAM MESKOUTINE, or the 'Baths of the Cursed,' is a lovely little resort in the heart of Algeria, within easy reach of Algiers, Bône, or Constantine. It is rather too far from Algiers to be got at in a single day. But by travelling all day to Constantine and sleeping there, one may then take the five o'clock train in the morning, which reaches Meskoutine at half-past nine. Of course, too, Constantine itself is a city worth seeing. Few towns, if any, have such a romantic situation: hedged in on three of its sides by a perpendicular gorge hundreds of feet in depth, with a river in the bed of it; and with its houses perched on the sides of the precipices consecrated to the service of storks as well as human beings.

The journey from Constantine gives one a good idea of the better class of Algerian landed estate. Not the best, by any means. That may be seen in the extreme west, or in the neighbourhood of Bône or Algiers itself. There one is prone to believe the farmer's life is without any anxiety, and that he and his wife are like Adam and Eve in Paradise. But south and east of Constantine to Meskoutine, though the land is tolerably well cultivated, it has grave defects. The great plateaux of grain bounded by well-shaped hills are horribly malarious in summer. The population, too, must be considerably less than one to the square mile. For many minutes in succession, one steams through these green tracts and sees neither house nor sign of one. French colonists are sturdy fellows, but they are not of iron. In the earlier days of Algerian occupation, hundreds of thousands of these acres were taken up by Land Companies, who by means of judicious advertisements transplanted a multitude of peasants hither from France, bag and baggage. The usual result followed. Those that did not die after breaking the soil for the first time in the history of the land were discreet enough to

go elsewhere. Successors had thus to be found for them; and of the successors also a due or undue proportion came to an untimely end. The rare settlements of little white houses on the hill-sides each seem to have a cemetery with more graves in it than the size of the village appears to justify. You may, if you like, buy thousands of these acres for a trifle.

So on—through the barley-fields, and stony uplands, and occasional valleys with rich lush meadows in them, and herds of oxen huddled together under the shade of a few trees by the side of a water-brook; and barren wastes that would take the heart out of an agriculturist and offer him nothing in return. At length the barrenness gives place to a broken country, with pleasant wooded hills, and a considerable river by the side of the railway. Forests of olives and thickets of scrub gladden the eyes, and tell of the game which is here plentiful enough to make Meskoutine worth visiting for the gun's sake alone. And so, having passed through two or three defiles, we finally draw up in a more open country, with hills in the distance on all sides, and with green meadows and dark woods far and near over the plateau. It is preciously hot; but then, no wonder, for the very streams in the gullies are of warm water; and if you are near one or other of the many springs which here burst from the ground, they may be warm enough to scald you.

The writer, when he left the train at Meskoutine on a fine May morning, did so in company with two or three rich Arabs in gay apparel, and a family of Jews and Jewesses with enough gold about their persons to keep them for years. These were some of the clients of the Baths of the Cursed. By-and-by we saw one of the ladies in one of the baths, draped in a sheet, and there was a look of pain in her eyes. Here at the station, however, though it is a fashionable resort for Europeans as well as Africans, was none of the tumult of welcome with which porters and domestics assail the visitor at other 'Bath' cities. Two or three tawny individuals

lounge against the palings of the little flower-garden of the station, but offered no aid to any one. Jews, Arabs, and Europeans were left to look after themselves as best they could.

It is a walk of but three or four minutes to the Bath establishment, and some of the various wonders of Meskoutine. Wonders? you ask. Why, yes; there's no doubt the word is applicable here. For, ere you have walked a quarter of a mile, you come face to face with a superb waterfall, *hot* waterfall, which makes you hold your breath from admiration and the plenitude of its steam. Yet it is not all of water. For the most part, it is rigid, like a thing of ice. It is, in fact, mainly a petrification. The calcareous deposit in the hot springs above has encrusted the rocks, so that they have the corrugated appearance and something of the colour of barley-sugar. Here and there, over and between the still masses, there is an ooze or trickle of warm water, adding to the work already done. Grass and flowers grow well by the sides of this nutritious waterfall; though the whitened soil in the neighbourhood does not seem adapted for vegetation of any kind.

You climb to the level of the top of the cascade, and then see, close by, a number of odd-looking cones and columns standing up from the blanched surface of the ground. The soil is hot to the hand, and you tread with an echo. The springs either were or still are under foot, making for the vents by the cascade. There they bubble up merrily with a temperature of more than two hundred degrees Fahrenheit. A litter of eggshells and fowls' feathers by the edge of them tells of the purpose they serve to the residents at Meskoutine. What is the use of lighting domestic fires when Nature offers her kitchen for human service night or day all the year round? And so here the dinner is cooked, and the clothes are washed in one or other of the little basins by which the springs eddy up to the daylight. Though the Arabs give the Baths so impolite a name, and tell various weird tales about them, they love them well. You see two or three of them, wrapped in their burnouses, lying, all white save their faces, near the foot of the cascade, fast asleep in the shade.

But the cones? Well, to borrow the figurative explanation of a French authority, they look like a procession of gigantic phantoms suddenly petrified. Some are six or seven feet in height, and some are fourteen or fifteen feet. They mark the site of ancient springs now subsided. At one time each of these cones was but the mere rim or lip of a basin in which the hot water bubbled as we see it at the top of the cascade. Thus the water continued to boil upwards in jets, like the geysers, for centuries, gradually—by the deposit of lime which fell from it—raising the height of its lip. Anon, the subterranean force which impelled it vertically weakened. The cone had attained its full stature. The springs one by one found other exits, and the cones themselves closed their orifices. Such is the matter-of-fact history of these eccentric rock-masses. The Arabs, however, have their own theory about the things. King Solomon, they say, here created baths for all the world, and put them in charge of a number of genii who were deaf, dumb, and blind. The cones are these

genii. And the worthy guardians, who still think King Solomon is alive, continue to keep the baths warm as they did at the first for the use of the king's subjects. It is supposed to be a matter of great difficulty to announce to these afflicted genii the fact that their master is dead. The inference is therefore that they will continue to warm the baths until the end of time.

There is also another tale which is less pleasant. A certain rich Arab had two children, a boy and a girl, both of remarkable beauty. These children loved each other with exceeding affection. When they grew up, their love remained unchanged, indeed increased until it became uncontrollable; and so they resolved to marry each other. The *cadi* of the tribe, after protest, agreed to sanction the marriage—they were so rich and so lovely a couple that it seemed to him and his neighbours that even Heaven itself would forgive such a crime in their case. The marriage day arrived. The concourse of visitors was immense. It was a calm bright morning, and all the auguries were hopeful. The preliminaries of the marriage were soon settled, and then feasting and dancing began. The married couple were about to withdraw to their tent, when suddenly a fearful tempest broke upon them; there was an earthquake; flames shot up in their midst; and boiling water rose into the air. When at length this diabolical storm and outbreak abated, nothing was left of the bride and bridegroom, the *cadi* and the guests, except these scores of cones. Like Lot's wife, they had all been transformed into stationary pillars from that time forward. The Arab imagination goes farther. It interprets the echo of your footfalls upon the hollow ground as an echo of the music of the marriage festival. The steam of the springs is that from the caldrons preparing the feast; and the white stones in the bubbling basins are the grains of the 'kouskous' itself. If you go among the cones at night, the scene revives—you see all the details of that awful marriage. But at the coming of dawn, the men and women all turn again into cones.

There is no luxury in the Bath Hotel of Meskoutine. That is against the principles of the place, which claims to be health-restoring, not through the medium of the kitchen, but by its air and its waters. You are informed that the 'cuisine' is of the 'bourgeois' type; and so it is. But the wine is good, and one may be sure of fruit here as early as in most places in the same latitude. The hotel is a spacious building occupying three sides of a square, the quadrangle in the midst being laid out in pleasant gardens and planted with orange trees, which in spring are massed with the sweetest bloom in the world. There is, further, a fountain in the centre of the quadrangle; and an aviary, in which canaries and parrots as well as divers of our English summer birds live together on fair terms of equality.

As the building is of but a single story, bedrooms as well as the living-rooms open immediately upon this garden plot. It is a primitive place, in which one is content for a time to dispense even with some of the *convenances*. Breakfast and dinner are of course the two chief events of the day for the person who is not out among the woods and mountains with his gun.

At the dinner-table, however, the company may be very good. Meskoutine has long been used by the military authorities as a station for invalids and convalescents. One may therefore find one's self among several agreeable and even distinguished officers who are here to recruit. But the idle life suits them for long as little as it suits a healthy Englishman; and one may be sure that they, too, will devote their hours to the chase just as soon as the doctor will let them.

Once upon a time, and not so very long ago, it was possible to shoot a lion in the neighbourhood of Meskoutine. Those halcyon days—if such they were for the Arab agriculturist—have passed away. A man must go many a mile over the hills to the south ere there is word of such royal game. The skins hanging about the walls of the hotel are of a less dignified kind: raccoons, panthers, and others. The sportsmen of the district are content with such prizes; and the hotel officials are very content if they can sell to the visitor one or other of these trivial pelts for but half the absurd price they presume to ask for them.

Winter is of course the best time for the Hammam. One can then appreciate to the full the warmth of the baths, when there is snow on the Djebel Debalg or the Djebel Mamora, north and west of the valley. In the days of the Romans this was a famous winter station. The fragments of their baths still remain, and the hotel gardens testify to the populousness of the place nearly two thousand years ago. There are a multitude of stone monuments and inscriptions set up among the orange trees to pique the fancy of archaeologists and antiquaries. The city of Tibilis itself, of which the Roman Meskoutine was only a dependency, lay some miles to the south; and its ruins are one of the excursions which the hotel has on its list as an undertaking by no means to be omitted either on foot or on a mule. Guides, however, are rather dear at Meskoutine, and transport-animals cost as much as ten or twelve francs a day.

One good feature about Meskoutine is the prevalence of high winds on the plateau. As a rule, in Algeria these winds are an intolerable nuisance. In Algiers or Constantine, for example, they are provocatives of ophthalmia, so galling is the dust which they whirl ceaselessly into one's face. But here, where the roads are few and rudimentary, and where one can always go across country, by pleasant meadows full of asphodels, or through olive woods with abundant shade from the sun, wind does not imply dust. At noon on a May day a register of one hundred degrees in the shade would be too much for active effort in a northerner, unless the blustering breeze from the hills tempered the heat, or at least tempered the effect of the heat upon one's energies. For my part, I found a walk of five or six miles at such a time easy and pleasurable; and the cave of the subterranean lake which was one of the objects of my walk, almost annoyingly cool as an interlude.

This cave, by the way, is another of the wonders of Meskoutine. It is hard to discover unaided, although it is little more than a mile from the hotel. As a cave it is not at all marvellous. It is a hole like other caves; but it has a supply of water in it which is reckoned quite

extraordinary. Previous to 1878, it was not in existence. But one wild July day in that year, during a storm the ground suddenly split with a great noise, and displayed it. Certain shepherds either saw or heard the operation of the phenomenon, which they of course at once viewed as the work of some malignant spirit. The next day, however, Europeans came upon the scene. They entered and saw a strong inrush of water, which continued until the present so-called 'lake' was formed. It is not warm water; but really clear and potable, which is the more remarkable because of the prevalence all around of the various hot springs of Meskoutine. The lake is about fifty yards long by thirty broad; though, without a boat, it is impossible to confirm these dimensions. As the slope from the mouth of the cave towards the water is abrupt and slippery with slime, one has to be careful in exploring. This is the more needful as the lake is some ninety feet or more in depth, although its clearness is terribly deceptive.

The adventurous visitor will regard this little cave and 'wonder' merely as a whet to his appetite for a much greater cavern, that of Thaya, a few miles nearer Constantine. Thaya is a cave in a thousand, and deserves to be mentioned in a breath with Adelsberg, which, however, beats it in size and conveniences of access. There is peril about Thaya, too—an additional recommendation in this tame age. It is not quite so perilous as Murray makes it. According to the guide-book, the descent to the 'bottom' chamber of it—only three-quarters of a mile from the entrance—is not less than a thousand feet. That would be a fearful gradient, especially with precipices of unfathomed depth upon one side of the track. Later measurements, however, disprove Mr Murray's record. Still, a descent of about five hundred feet—which is the approximate amount—is no small thing. Here, also, one finds that we have been anticipated by the Romans. There are scribblings and chisellings on the walls which show that the place was dedicated to the god Bacax, a divinity otherwise unknown to fame. In the bottom chamber, moreover, there is a big stone, which the fanciful are willing to regard as an altar upon which sacrifices of some kind were offered to this mysterious divinity. With the accessories, the scene of such a sacrifice might fitly be described by Mr Rider Haggard, but by no pen less potent. There is much exploration still to be done at Thaya, a fact which may tempt some of my readers. But it is work of the most arduous kind, apt to take more weight from a man than the most strenuous of Turkish baths. And one must always in such a case reckon with the possibility that one's Arab attendants may take alarm at something or other which tickles their superstitious faculty, and may bolt suddenly for the exit, leaving the poor European to guide himself back to daylight—a task that at Thaya might easily prove too much for him.

From November to May, Meskoutine is sure to please the visitor. At other times he will probably think it too warm; and much too warm for the offer of hot baths as a further incentive to him to stay a while. Of course for medicinal purposes it is useful all the year round. Like other bath stations, it claims to cure a vast

number of diseases. No doubt it does a great deal for skin maladies and rheumatic affections. The hotel authorities will entertain you for hours with descriptions of the uncommon cures it has achieved. There is certainly no lack of water for the purpose. The outflow is not less than forty thousand gallons per hour, which puts many places of renown quite beneath it. The temperature of its liquor is also extraordinary, being nearly ten times as hot as that of the Homburg baths, twice as hot as the waters of Aix-les-Bains, and about thirty per cent. hotter than those of Carlsbad.

Of course, however, it recommends itself to our notice less as a hydropathic establishment than as an agreeable temporary pleasure-resort. It may not be, as the manager thinks it, an ideal place for a honeymoon; but it is not a bad one. Panther-shooting is at any rate likely to be viewed as an enjoyable variation upon the theme of love-making.

DUMARESQ'S DAUGHTER.

BY GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,'
'THIS MORTAL COIL,' ETC.

CHAPTER XXXIX.—FORTUNE'S WHEEL.

At Algiers, meanwhile, things had been going from bad to worse with Psyche. Her sight grew daily dimmer and dimmer, and her general health feebler and feebler. Suspense was rapidly wearing her out. The shock, if it came, Sirena thought, would surely kill her.

And yet, at times, almost as if by magic, the poor broken girl recovered for many minutes together the use of her eyes as perfectly as ever. Of a sudden, as she stood or walked across the room, the misty blur that obscured her vision would now and again clear away with mysterious rapidity, and reveal as in an electric flash all the objects around with a vivid distinctness that fairly took her breath away. At such moments, things came out not only as bright and clear as of old, but with a startling brilliancy of colour and outline that she had never known in her normal condition. The dormant nerves, recalled to intermittent activity for a few brief seconds by some internal stimulus, seemed to concentrate on a single perceptive effort all the hoarded energy of a week's idleness.

It was on the day of Cyrus's arrival at Biskra that Psyche sat in the pretty little salon at the Villa des Orangers, with Sirena's hand entwined in her own, and her father watching her earnestly with those keen eyes of his from a seat on the central ottoman.

'No telegram from your brother yet to-day, Sirena,' she said with a sigh. 'How slow the days go! A week on Saturday!'

'The telegram will come soon, darling,' Sirena answered, smoothing her hair and pressing her hand gently. 'Would you like me to read to you—the end of that story?'

'What story?' Psyche asked, looking up vacantly with her sightless eyes in Sirena's direction.—'Oh yes; I remember. You were reading it this morning. No, dear; I don't even remember what it was about. I don't think I heard the words themselves at all; but the pleasant sound

of your voice in my ears seemed to soothe me and ease me.—You can't think, Sirena, what a comfort it is, when you don't see, to hear familiar voices humming around you; and yours is almost like a sister's voice to me now already. But I don't care even for reading this afternoon.—Where's papa? I thought he was here a minute ago.' And she turned her head round by pure force of habit, as if to look for him.

'Here I am, my child,' Haviland Dumaresq answered in a low voice. 'Don't you feel me quite close? I'm sitting by your side. I won't go away from you.'

'Don't,' Psyche said simply. 'I want you all now—as long as it lasts—everybody that loves me.—I didn't hear you, Papa. I suppose I shall learn in time—if I live—to listen and hear you. One can't accustom one's self all at once to being blind. It's so slow to learn. I turn my head still, and try to look, when I want to find any one. By-and-by, I daresay, I shall remember to listen for them.'

'But you're not going to be blind for ever, Psyche,' her father cried with the vehemence of despair. 'Not for ever, my child. They all say so. The doctors declare you'll get over it by-and-by. It's purely functional, they tell me: purely functional.'

'I don't know,' Psyche answered in a very slow but patient voice. 'It doesn't much matter. At times, I see again quite distinctly—oh, so distinctly; though not by an effort of will, as they said, at all. It seems to come to me quite by accident. But the odd thing is, after each time that I see so clearly once more—I fancy it all grows darker and dimmer and blacker than ever. The minutes of clearness seem like the last flickers of a fire before it goes out. My sight is ebbing away from me piecemeal.'

At that moment, there came a sharp knock at the door, and Antoine, the good-humoured Swiss waiter, entered briskly with a bundle of letters in his hand.

'The post,' he said, sorting them over hastily. 'Meester Vanrenen; mademoiselle, you will keep that for him against his return. M. Waldeck—Madame Smit—Mees Vilson—Mees Dumaresq.'

The father rose and tried in his haste to secure the letter; but before he could snatch it from Antoine's hands, Psyche, too, had risen and stepped boldly forward, with a firm tread which showed Sirena at once, in the twinkling of an eye, that a momentary interval of vivid sight had once more been vouchsafed her. 'Give it to me,' she cried, holding her hand out eagerly. 'I'll read it myself. I can see now. I'm not afraid. Whatever it may be, I'd rather read it.'

'Psyche,' her father exclaimed, laying his hand on her arm with a warning gesture: 'don't try your eyes, if they can see for a minute. Spare them, my darling. Let me read it first, or give it to Sirena. Besides, I'm afraid of what it may contain for you. Let me look at it, there's a good girl. I'll see what it is for you.'

But Psyche answered 'No,' with perfect firmness, clasping it hard in her small hand. 'I can read now, and I'd rather read. Besides, it's nothing. It isn't from Biskra. It's only from home. It has an English stamp on it.' And she looked at the envelope with almost the uncon-

cerned manner of the old days, when to see and to read was a matter of course with her.

The envelope bore an embossed seal on the gummed flap: 'Burchell and Dobbs, Solicitors, Chancery Lane, London.' So much Sirena took in at a glance, as she looked askance at the letter curiously in her friend's hand.

Psyche broke the seal with trembling fingers: not that the letter could matter much to her now; but everything in these days seemed so fraught with latent and unspeakable terrors. She never knew what a day might bring forth in the present crisis.

As she gazed at it, the first words that met her eyes almost drove her blind again with horror and astonishment. What on earth could they mean? What on earth could they portend? For the letter was headed with lawyer-like precision, 'In the matter of C. A. Linnell, deceased. Probate granted.'

"In the matter of C. A. Linnell, deceased!" Linnell, deceased! Linnell, deceased! Oh, horrible! horrible! Psyche laid down the letter for a moment, still clutched as by iron in her two white hands, but folded on her lap as though she could not even bear to look at it. Then he was dead, dead, really dead at last! The law itself had declared all hope was over. In the matter of C. A. Linnell, deceased! Probate granted! Probate granted!

How it rang in her ears! How it whirled through her brain! How it pictured itself visibly on her wearied eyeballs! She raised her eyes mechanically to the white-washed ceiling. In letters of blood, half a yard long, she saw it written there: 'In the matter of C. A. Linnell, deceased.' It was printed as in marble on the very fabric of her failing retina.

She turned away in her horror, and looked down at the floor. On the yellow Persian rug she saw it there still, a negative image in dark running script-hand. It came out deep purple. It would follow her to the grave, she firmly believed. Linnell, deceased! Linnell, deceased! No power on earth could remove it now from her burning eyeballs.

She closed her eyes; but it floated there still, a visible line of fire amid the thick darkness. 'In the matter of C. A. Linnell, deceased.' Dead! Dead! Dead! So he was dead indeed. The letter pursued her. It crushed her. It haunted her.

She took up the fatal missive once more and tried to read it through; but she couldn't, she couldn't. Her eyesight was failing her again now. Those deadly words blurred and distorted the rest of the paper. She saw the whole as a transparency through those awful lines. Her strength gave way. She closed her eyes and cried. 'Read it to me, Sirena;' she sobbed aloud, letting it drop; and Sirena read it.

It was a long and formal statement by Linnell's solicitor of the disposition made of the deceased's property. Sirena hesitated whether she should read every word, in all its naked official bluntness, with its professional absence of emotion or feeling; but each time that she paused or faltered, Psyche laid a cold white hand on her wrist once more and murmured resolutely: 'Go on. I can bear it. I want to hear all. It's better I should know.' And Sirena read on, to the uttermost syllable.

'Our late client,' the lawyer's letter remarked, with legal periphrasis, had made a will before leaving England (copy of which was herewith annexed), whereby he devised the bulk of his real and personal estate to his sole legatee, Psyche, daughter of Haviland Dumaresq, Esquire, of the Wren's Nest, Petherton Episcopi, in the county of Dorset, as a testimony to the profound respect he felt for her father's distinguished literary and philosophical ability. Their late client, it appeared, had gone to Khartoum, and there in all probability been killed in the general massacre of European defenders after the Mahdi's troops entered the city. Absolute legal proof of death being in this case difficult or indeed impossible, the firm had waited for a full year before attempting to take out probate. That was a longer time than had been allowed to elapse with regard to the estate of any other of the Khartoum victims. The late Mr C. A. Linnell, however, had particularly arranged with their firm that in case of serious ground for apprehension arising, a reasonable period should be permitted to intervene before definite action was taken in the matter. Under these circumstances, they had waited long; but probate had now at last been granted to the executor named therein; and it was the firm's duty, as solicitors to that executor, to announce to Miss Dumaresq that the property devised was henceforward hers, and hers only. With reference, however, to the Linnell estates at large—that was to say, the estate of the late Sir Austen Linnell, Baronet, deceased at the same time with his cousin at Khartoum—it was their duty to inform her that a serious question might hereafter arise as to whether it had ever passed at all into Mr C. A. Linnell's possession. If Mr C. A. Linnell, the testator, predeceased his cousin, the late baronet, then and in that case—

But there Psyche, brave and resolute as she was, could stand it no longer. She clasped her hands tight on her lap and burst into tears. She could never inherit her dead lover's fortune. She had murdered him! She had murdered him! She had sent him to his death. And now she knew how much he had loved her. In the very moment of that first great disappointment, he had thought of her and loved her.

As for Haviland Dumaresq, bowed and bent with grief, he sat there still, listening and wondering over this strange news, with a horrible turmoil of conflicting emotions, and forming already in his whirling brain fresh plans and day-dreams for poor heart-broken Psyche. 'Give me the will,' he cried, turning quickly to Sirena. The girl handed him the attested copy. Haviland Dumaresq buried himself at once in that and the letter, while Sirena turned to lay poor sobbing Psyche's weary little head on her comforting shoulder.

The old man read and re-read for some minutes in silence. Then he looked up amazed, and cried aloud in a voice full almost of awe and reverence: 'Then Linnell had a fortune of something like seven thousand a year, it seems, Psyche.'

'Papa!' Psyche exclaimed, rising up before him in ineffable horror. 'If you say another word about that unspeakable Thing, you will kill me, you will kill me!'

Haviland Dumaresq turned back with a reeling brain to those astonishing figures. The mad mood of greed was upon him once more: the un-

natural mood brought about by those long years of continuous opium-eating. What a fool he had been; and how dearly he had paid for it! To turn away a man with seven thousand a year—a man that Psyche loved, a man who loved Psyche! But all had come out well in the end for all that. The man had done as he ought to have done—made a just will in Psyche's favour; and Psyche, who loved him, would now inherit everything. He was not without remorse, of course, for his own part in the drama. It would have been better, no doubt, in some ways better, if only the young fellow could have married Psyche, instead of dying and leaving her his fortune. The iron had sunk deep into Psyche's soul: she had suffered much: it would be long before those scars could heal over entirely. But they would heal in time; they would heal in time: all human emotions weaken in effect with each mental repetition. And Psyche would now own the fortune herself. She would own it herself, and marry whom she liked. For in time, without a doubt, she would be wise and marry.

Not Cyrus Vanrenen. Not that empty young man. No, indeed: he was never good enough for Psyche. In a period of trouble, and under special conditions of fear for the future, Haviland Dumaresq had been willing for a moment to admit that vague and unsatisfactory young American—vulgar, vulgar, and bad tone too, though undoubtedly good-hearted—to the high privilege of paying court to Psyche. But now that Psyche's future was otherwise secured—now that the load was lifted from his soul—now that all was coming straight by an unwonted miracle—he had other ambitions, other schemes for his Psyche. No American for her—an heiress in her own right, and Dumaresq's daughter. She could command whom she would—she could choose her own fate—she was rich, rich, rich—and Dumaresq's daughter.

Her eyes, he felt confident, would get well by-and-by. This fit of disappointed love was sharp and critical, to be sure; but she had youth on her side: at her age, one can outlive and outgrow anything.

Except, perhaps, a broken heart; and Haviland Dumaresq did not even yet understand that Psyche's heart was really broken.

BUR-FRUIITS AND HOOKED SEEDS.

ALL the higher plants are fixed throughout their life to one spot; they have no power to move from place to place, and would be incapable of spreading over the earth to any great extent unless they could avail themselves of some natural agency for the transport of their seeds. Hence arises the necessity for those beautiful and varied contrivances observed throughout the vegetable kingdom for promoting the dispersion of seeds. The natural agencies at disposal for this purpose are not very numerous. A number of seed-capsules are more or less elastic, and when ripe, suddenly explode, discharging their seeds with considerable force. The seeds of the broom and the violet are scattered in this way. Berries and stone-fruits like the cherry have their seeds dispersed by birds. Attracted by the bright colour of the fruit, a bird devours the

soft sweet pulp, and after conveying the hard seeds some distance, lets them fall to the earth. Water-lilies and some other aquatic plants have seeds provided with air-cavities or floats, and are disseminated by water-currents. The bulk of terrestrial plants, however, depend on the wind for dissemination. The lightness and small size of most seeds favour their wide distribution by this means. Special provisions facilitating wind-dispersion occur in many cases; the seed, or the fruit itself where this contains but one seed, is frequently provided with membranous expansions or wings, as in the pine, maple, and ash; or with a tuft of hairs, as in the willow, poplar, thistle, and dandelion.

Of all natural agencies, the wind is undoubtedly by far the most efficient in scattering vegetable seeds; but it is not necessarily in all cases the most economical. For one thing, a large proportion of wind-blown seeds must fall into the sea and perish, as salt water quickly destroys their power of germination. Only a small proportion can possibly alight in places suitable for their development. The objections to this mode of dispersion become very great where the seeds require to be delivered in particular stations corresponding to the habitat of the species. In a large number of plants this difficulty has been met by the seeds acquiring the power of attaching themselves to the skins of four-footed animals, whose movements and migrations are thus utilised for the dispersion of the seeds. The expression, more forcible than elegant, 'to stick like a bur,' refers to the well-known adhesive property of the flower-heads of the burdock—a property shared by many other plants.

A roughened surface alone may be sufficient in the case of small seeds to cause them to adhere to fur or wool. Every one has noticed how readily hayseeds cling to clothes or hair. The tubercles, reticulations, wrinkles, and furrows observed on the surface of many small seeds may be of use in this way. In the chickweed, campion, and other members of the *Stitchwort* family, the seed is studded over with minute projections; while rough or rugose seeds are of common occurrence in other families.

More marked examples of adaptation to transport by animal agency are seen in those fruits and seeds furnished with prickles, hooks, or prongs. These appendages by which the seed fastens itself to the coat of an animal assume various forms suggestive of combs, hairpins, skewers, barbed arrows, fish-hooks, tridents, anchor-flukes, harpoons, and grappling-irons. Organs of this description are so obviously adapted to become entangled in wool, fur, or hair, that there can be no doubt as to their use. Seeds are constantly imported with foreign hides; and on the banks of streams where wool is washed strange plants are observed from time to time to have established themselves.

Under the term 'fruit' botanists include all seed-vessels, whether succulent or not; thus, a dry seed-capsule like that of the poppy, the pod of a pea, a hazel nut, and a grain of wheat, are all fruits in the botanical sense. Capsules which contain numerous seeds usually split open when ripe, to admit of the discharge and distribution of the seeds within. The capsule remains attached to the mother-plant; but the

seeds are loosened, and break away by their own weight. One-seeded fruits, on the other hand, seldom open; and when ripe, separate from the parent plant. Such dry, one-seeded fruits are known as achenes. Hooked appendages are much more frequent on achenes than on seeds, for the very obvious reason that hooks on seeds contained within a capsular fruit have very little chance of coming in contact with any animal. At maturity, an achene which is adapted for wind-dispersion generally severs its connection with the stalk, and either falls to the ground or is borne away on the breeze. Hooked achenes are not quite so easily detached. Even when ripe, they do not spontaneously fall to the earth; neither is the force of the wind sufficient to remove them. Most ordinary plants shed their seeds or cast their ripe fruits; but where hooked appendages occur, the fruit requires to be plucked, the services of an animal being necessary for its removal. Some little force is needed even if the achene be perfectly ripe—just such force as might be exerted by a passing animal in whose hair the hook had caught. The fruits and seeds of trees, as pointed out by Lubbock, are seldom if ever provided with hooklets—a circumstance explained by the fact that there are no animals sufficiently tall to reach up to them. The absence of hooklets from the fruits of very diminutive species has also been remarked. The height of the plant in the latter case is insufficient to bring the fruit into contact with any animal likely to prove an effectual agent in dispersion.

To both these rules there may of course be exceptions. Hooked seeds on a low-growing plant or dropped from a lofty tree would always have an occasional chance of attaching themselves to animals lying down or rolling about on the ground; they might also be dispersed by some of the smaller rodents. The smallest plant in the British flora bearing adhesive fruits is the forget-me-not; all the others have a pretty uniform height, varying from two to four feet, from which we may gather that the adaptation has reference to animals of some considerable size, such as sheep and goats.

With one or two exceptions, the plants indigenous to Britain which have adhesive fruits are of common occurrence. A familiar garden weed, one of the Forget-me-nots (*Myosotis arvensis*), has the calyx which encloses the fruit beset with numerous stiff hooklets, which readily fix themselves to one's clothes. Hound's-tongue (*Cynoglossum*), another plant belonging to the same order as forget-me-not, has its fruits covered with hooked bristles; as has also the Enchanter's-nightshade (*Circæa*), one of the Fuchsia family, not uncommon in damp woods. A still better example is the bur-fruit of *Galium aparine*, the common Bedstraw, sometimes called, on account of its peculiar climbing habit, Robin-run-the-hedge. The entire surface of the plant is hispid; the hooked hairs on the stem assist the bedstraw in climbing, while those on the fruit serve for dispersion. Each longitudinal ridge on the fruit of the Carrot (*Daucus*) is surmounted by a comb-like row of curved spines. The Bur-parsley (*Caucalis*) and the Hedge-parsley (*Torilis*) also have their little fruits bristling like a hedgehog with spines more or less hooked at their tips.

Very frequently there is but one hook on each seed or achene, as in the Avens (*Geum*), where the persistent style forms a terminal hook. A well-developed specimen of this fruit presents a striking resemblance to a grapnel.

One of the best plants on which to study these contrivances is the common agrimony. It has an erect, unbranched, rod-like stem, on which at intervals apart are set the little pear-shaped fruits. Each fruit is crowned with several circlets of hooked hairs, and is at first upright or horizontal; but when quite ripe, becomes inverted by the bending or twisting of its very short pedicel or stalk. The bristles at the same time spread out, exposing their points. The object of these changes is evidently to promote the removal of the ripe fruit by passing animals. A branch can be broken from a tree much more easily by pulling it away from the stem than by pressing it towards the stem. In its original position, the fruit of agrimony, when its hooklets caught hold, say, of a passing sheep, would be pressed towards the stem; but in the inverted position it is pulled in a direction away from the stem, and is therefore more easily removed. At the same time, the hooklets will be more deeply involved in the sheep's fleece. The Enchanter's-nightshade inverts its ripe fruits in the same way.

Two perfectly distinct modes of dispersion are provided for in the Burdock (*Arcetium*), which may therefore be said to have two strings to its bow. The plant belongs to the order Compositæ, its small flowers being produced in compact heads or capitula, which are surrounded by overlapping scales or bracts. Each bract forming the involucre terminates in a strong hook; the flower-heads are therefore adapted to be dispersed by animals. But in addition to this, each little fruit within the involucre is furnished with a pappus or tuft of hairs, fitting it for distribution by the wind. Supposing the capitula or burs of *Arcetium* dispersed by animals, each flower-head then becomes a new centre of dispersion from which the individual fruits are scattered by the wind. Such a double distribution must be more efficient than dispersion from a single centre.

The flower-heads of the Fuller's teasel, formerly used for raising the nap of cloth, have hooked bracts not unlike those of *Arcetium*. The spiny bracts surrounding the heads of some of the thistles possibly serve a similar purpose; but these are not easily detached from the flower-stalk. As thistles wither, however, their stems become dry and brittle; there may, therefore, be no necessity for detaching the capitula if portions of the plant readily come away with them. The bracts composing the involucre of the Knapweed (*Centaurea*) have beautifully pectinated margins, and it is difficult to suggest any other use for these than that they may serve to attach the flower-heads to wool or fur.

Many grass-seeds have the adhesive character in a high degree, caused by a rough surface, ciliated glumes, or a serrated awn. The awn or bristle attached to the barley grain appears to act as a skewer for fastening the seed to the covering of an animal. Bearded or aristate grains have a remarkable penetrating power, approaching in this respect the burrowing seeds of the stork's-bill. A grain of barley having its bristle

attached, placed in one's sleeve, soon works its way up to the shoulder; and it is easy to see how an animal's movements would cause a seed like this to become firmly embedded in its hair or wool.

Long cultivation has probably so greatly altered our cereals that very little can with safety be inferred from their present condition. They are not now found in the wild state, a circumstance which Hildebrand ascribes to their having lost through cultivation their means of dispersion, whereby they are no longer able to hold their own against natural species. The meadow and canary grasses are adapted for wind-dispersion, as also *Phragmites*, *Pennisetum*, and several others; but the grasses in general may be considered to have their seeds adapted for dispersion by means of animals. This, moreover, is only what we might expect, when we consider the vast herds of buffaloes, deer, antelopes, and other large graminivorous animals that still inhabit the grassy plains of Africa, and formerly roamed on the American prairies and Asiatic steppes. Nature is economical of her means, and it is reasonable to suppose that as an animal became dependent on a certain class of plants for food, it should be utilised as an agent in their dispersion. Such, in a state of nature, is apparently the relation subsisting between the grasses and some of the larger ruminants.

These mutual accommodations form a pleasing contrast to the arrangements in the Grapple plant, *Harpagophytum*. Even of the vegetable kingdom it is sometimes true that Nature is 'red in tooth and claw.' The fruit of *H. procumbens* has upwards of a dozen stout flattened spines projecting an inch or two from its surface. Each spine terminates in a grapple-like arrangement of strong recurved hooks; while its sharp edges are also furnished with hooked processes of similar character. These sharp spines will cut the strongest leather. This formidable fruit is accredited with causing the death of the lion. Should one adhere to its skin and the lion attempt to disengage it, the fruit is almost certain to be transferred to the lion's mouth. The wounds there inflicted by the sharp spines drive the animal frantic; but every effort to get rid of the encumbrance is vain, and only results in the infliction of fresh wounds, until ultimately the animal succumbs to the torture. Dr Livingstone states that if this fruit happens to lay hold of the mouth of an ox, the animal stands and roars with pain and a sense of helplessness. The same traveller also mentions a fruit which lies flat like a shilling with two thorns in its centre, ready to run into the foot of any animal that treads upon it and stick there for days together.

Another curious example of these forbidden or rather forbidding fruits is *Martynia proboscidea*. This fruit, about three inches long, and resembling a pea-pod, terminates in two slender curved prongs, exceeding the fruit itself in length. The writer has seen a specimen of a fruit, said to have been obtained from imported wool, very similar to this, but much larger, the prongs being six or eight inches long. In some parts of the country these fruits are preserved as household curiosities, and locally known as the 'Devil's horns.' The West Indian snake-fang seed, shaped like an almond, but larger, is pro-

vided with two short recurved hooks at one end. A plant of the Mallow order, *Pavonia spinifex*, has three diverging prongs attached to each nutlet, beset with backward-pointing barbs. *Acæna procumbens* has several slender spines barbed at their extremities like an arrow. The seed of *Villarsia*, an aquatic genus, is fringed with ciliated processes. Hooked seeds are characteristic of a small Australian order allied to the milkwort; while the *Triumphettas* are tropical weeds with bur-fruits like those of the bedstraw.

Hooked appendages might prove a disadvantage rather than a benefit if there was any possibility of the achene becoming detached before it was ripe. Hence the fruit is firmly attached to the mother-plant, and only at maturity is the connection so weakened as to admit of easy separation. The sharp points of the hooks, as we have seen, are seldom exposed until the fruit is perfectly ripe. The unripened fruits of *Galium*, *Geum*, &c. have little or no adhesive power. In *Geum* and *Agrimonia* the fruit is at first vertical, and its hooks are concealed; but when ripe, its position is inverted, and the hooklets spread out exposing their points. The umbel of the carrot, while the seed is maturing, has its rays gathered closely together, forming a ball, and the hooks are not exposed till the seeds are ripe.

A close examination of the hooklets in *Torilis*, *Myosotis*, *Geum*, *Agrimonia*, &c., shows that even the point of the hook itself is not properly formed till the very last moment. As these slender projections dry they not only curve and spread, but a slight torsion also takes place. On account of this twisting, the curve of the hook ceases to be circular and becomes slightly spiral; its curvature is not all in one plane, but, like a fish-hook, the point is turned a little to one side. By this torsion of the spines their points become fully exposed, and this explains how these appendages so suddenly acquire the property of taking hold of one's clothes when the seeds are ripe. As they shrivel, the hooklets tighten their grasp, but through time become brittle; and should the animal rub against a tree or clean itself, are not difficult to dislodge.

Bur-fruits are seldom clustered like berries; the internodes of the stem in forget-me-not and agrimony elongate after flowering, whereby the burs are separated from each other, so that it is hardly possible for one animal to tear them all away at once. This isolation of the fruits secures for them a more gradual and widespread distribution; and the plant avoids the risk of putting all its eggs in one basket.

Certain plants have sticky seeds which gum themselves to the hairs of animals. Of this class we have no good examples among our native species. The mistletoe has a sticky seed, but, as its fruit is a berry dispersed by birds, it cannot be included 'amongst rude burs and thistles.' The seeds of *Linum* and *Polemonium* become glutinous when moistened, but it is uncertain whether this peculiarity aids in dissemination or not; the same may be said of the glandular hairs of *Plumbago* and *Linnaea borealis*. A viscid secretion is better adapted than a hook for adhering to a smooth surface; and it is quite possible that some of the viscid class may be dispersed by reptiles and other hairless creatures. The number of plants in which this provision exists is small, and they

do not properly belong to our subject, which has to do not with the agency of animals in dispersion generally, so much as with those curious organs of attachment to which reference is made in the title of this paper.

A NOBLE REVENGE.

By JESSIE MACLEOD.

IN FOUR PARTS.

PART I.—SUNKEN ROCKS.

'Who are these new arrivals, I wonder? Friends of my husband, I suppose, for I do not recognise them,' said Lady Adair, who with several visitors was enjoying the morning sunshine on a high-terraced walk in her flower-garden, overlooking the carriage drive, up which a vehicle was approaching.

'It is a hired chaise from the station at Mochram,' observed Mrs King; 'and as there is no luggage, they have evidently not come to stay.'

'Hardly, or I should have had intimation,' replied Lady Adair. 'I am sorry Sir Hugh has gone with the shooting-party. Perhaps they have business with him. I must return to the house and ascertain.'

'If I may make a remark,' said a very young lady, whose observation and eyes were keen, 'I should hardly take these visitors for gentlemen—two of them, at anyrate. Fancy chimney-pot hats and blue ties! Besides, there is something—something'—She stopped, as it occurred to her that such remarks were not well-bred.

'It is impossible to judge who are gentlemen and who are not, by their dress, for appearance does not count in these days. Wait until you hear them talk,' said Lady Adair.

'One of them was not unlike the chief clerk at the bank; but not having seen him many times, I cannot say for certain. If it is he, I fear there must be something the matter at home,' observed Mrs Gravenor, a sweet-looking young woman, in a tone of anxiety. She always spoke of her family as 'home,' for Captain Gravenor had not yet set up his Lares and Penates, but moved about with his regiment.

'I will go and see,' said Lady Adair, descending the steps.

A footman met her. 'Three gentlemen on business to Captain Gravenor, my lady. They are in the morning-room.'

She hastened to the house, entering an apartment opening from the entrance hall, one set aside for chance visitors, and where Sir Hugh transacted affairs connected with his estate.

'I regret that Captain Gravenor has accompanied a shooting-party to the moors; he will scarcely be back before sunset. I trust your business is not very urgent?' said she, scanning successively the faces of the three strangers, not knowing whom to address as the principal.

'My name is Parish. I am in the bank of Desborough & Co., of Nicholas Lane. I have accompanied these gentlemen from London, who particularly wish to see Captain Gravenor,' replied the eldest of the three, indicating his companions with a wave of the hand.

'I suppose we can drive after them?' said one of the men, taking up his hat, as if about to depart.

'You evidently are unacquainted with Scotland. You might possibly overtake the party by riding; but to drive you cannot; there are no roads,' remarked the lady.

'What is to be done?' said the other to his companion. They looked at each other non-plussed.

'Mrs Gravenor is here; perhaps you might like to see her?'

'By no means, ma'am. It is no business that she can transact,' said the spokesman, with a grim smile.

Lady Adair, without knowing wherefore, felt a vague uneasiness. The reticence, the total absence of ceremony in these strangers, set her wondering. What was she to do with them? They had driven ten miles from Mochram, a little so-called town, that had sprung up around the nearest station on a loop-line from Stirling.

'If the affair is urgent,' said she, 'you can have a pony from the stables for one gentleman, and a groom to accompany him. Perhaps the others can find amusement in the meantime in visiting the grounds, and with newspapers.—Will you allow me to offer you some luncheon?'

This proposal was accepted with thanks.

'The fact is, ma'am,' said Mr Parish, 'our business is not a pleasant one, to say the best of it. Mrs Gravenor may be best kept in the dark.'

'I am sorry,' said Lady Adair, turning pale. 'I hope there is no illness—no death?'

'No, ma'am, nothing of that kind; but as bad in another way.'

It must be money, thought the lady, for she knew that, previous to his marriage, Captain Gravenor had lived fast. She consigned the strangers to the care of the butler, who provided a hospitable luncheon, to which they did ample justice, after their drive in the mountain air. Then the leader of the party was mounted on a strong pony, and, accompanied by a groom, set out for the moor where the sportsmen might presumably be found; and the chaise was put up in the stable.

'You were right, Lena; it is Mr Parish from your father's bank; but there is nobody ill in your family; he merely wishes to see Captain Gravenor on business,' said Lady Adair, wishing to reassure the young wife.

'What a strange thing! And we have not yet left London a week. I do not think Papa can have sent any money, for he made George a handsome present recently,' said Mrs Gravenor, who made no secret of being poor—for she was poor, although a banker's daughter. Money is seldom plentiful in a banker's house; it is no unusual thing for his home to be a penurious one; and in this case, although Lena Desborough would have money, it could not be until her father's death—she had no marriage dowry.

Keeping his money-bags so closely tied, sons-in-law did not appear. When Captain Gravenor asked for Helena, or Lena, as she was familiarly called, the youngest of his three daughters, upon whom all the beauty and amiability of the family were concentrated, he was refused by the old gentleman, for it was well known that he had carelessly run through whatever property he had possessed. She, seeing the lives of her sisters soured by disappointments, weary of their sharp tongues and jealous tempers, took her fate in her

own hands, and quietly married Captain Gravenor one morning at All Souls' Church, when she was supposed to be reading in Park Square Gardens. She was a mild gentle girl; this was the only time in her life she had ever acted on her own responsibility. These young people were wrong; and, like most deviations from the straightforward path, punishment followed it. At first, Mr Desborough was enraged; but as he loved his youngest child the most, he soon thought better of the matter, for Captain Gravenor was a gentleman, the last survivor of a good family. What was more, he had married Lena without settlements; therefore, the banker held future arrangements in his own hands. At last he consented to receive his son-in-law, and they became, if not on a cordial, at least on a friendly footing with one another. He gave no settled income to Lena, but sent cheques occasionally. People said that the Captain had married her hoping for a fortune. They were wrong; he married her because she was sweet enough to be valued for herself alone.

In the meantime the young officer, unconscious of the unpleasant news coming to overtake him, was the gayest of a rather large party of sportsmen. He was a tall, fair, handsome man of seven-and-twenty; a general favourite. Genial, thoughtless, fond of pleasure, he had made ducks and drakes of his inheritance, but nothing worse. Honourable at heart, he had almost paid his liabilities up to the last penny. This left him poor, but with a character unsullied.

'Do not laugh so immoderately, Gravenor,' said Sir Hugh. 'The old wives say, "They that laugh in the morning will greet ere e'en."'

'You think me "fey"?'

'Not so bad as that—only, it's not lucky.'

'Put it down to your exhilarating mountain air. Ozone is as intoxicating as whisky. As for your Scotch proverb, I can cap that with the English one of "Laugh and grow fat." Don't you know that there is a certain valve in the heart that only opens with laughter?'

'Well,' said Sir Hugh, gazing at the open, handsome face and bright blue eyes of his young guest with a certain admiration, 'I suppose it is natural that you, with a charming young wife, and a military promising career before you, should be gay. Old fogies like me have cares as we advance in life; while you—'

'Have not a care in the world—that is, nothing to be called by so serious a name. A little more money would be desirable; but I am perfectly happy without it.'

Bang, bang! An unerring marksman, he had not missed a bird that morning.

'Your hand is well in. As for the grouse'—Sir Hugh interrupted himself. 'Who are these coming after us? Some one I do not know on Kelpie, and Campbell on Prince. Well, the more the merrier.'

He concerned himself no more about the matter, continuing to follow the beaters, leaving the new-comers to overtake the party, which at last they did. Then Sir Hugh saw a stranger.

'Gentleman from London, Sir Hugh, come after Captain Gravenor on business,' said Campbell.

'Nothing serious, I hope?' said the Baronet, advancing.

'It may or it may not be, sir,' replied the

stranger, lifting his hat. 'I came express with two companions, who remain at your house. The good lady thought it best to send me up here.—What a long ride it has been—awfully steep, and confounded footing' (wiping his hot forehead).—'Well, sir, which is Captain Gravenor?'

'Hillo, Gravenor!' shouted Sir Hugh. 'Come here; some one for you.'

Captain Gravenor instantly turned back, taking long strides over the heather, his fine figure a model of manly beauty, his fair face beaming with health and excitement. He came up to the new visitor, looking at him curiously—evidently not knowing him.

'Are you Captain Gravenor?' said the stranger, dismounting.

'Yes,' replied the Captain, surprised.

'You must come with me at once.'

'Come with *you*.—Why?'

The man led him apart from the others. 'Because I have come from Scotland Yard to arrest you,' he answered in an under-tone.

'Arrest me! What for?' cried the officer in amazement.

'For forgery.'

Captain Gravenor flushed crimson with indignation. 'How dare you!' he cried. 'I've a great mind to knock you down!'

'That would only make matters worse. You just come with me quiet, unless you want the others to know.'

'All the world may know!' exclaimed the Captain angrily. 'I never heard such a ridiculous charge in my life. Upon whom am I supposed to have forged, if you please?'

'Mr Desborough.'

Captain Gravenor laughed; his good spirits had not deserted him. 'This is really too good. It must be a practical joke.'

'You'll find it only truth.—Here is the warrant for your arrest. We've come from London on purpose; me, another officer, and Mr Parish, clerk from the Nicholas Lane Bank.'

'There is, then, some dreadful mistake.' He beckoned to the Baronet, who stood out of ear-shot, but who plainly understood that something was wrong. 'Sir Hugh,' said he, 'I must curtail my pleasant visit, and accompany this person back to London at once.' Then he related the accusation, in a bitter scornful tone.

Sir Hugh looked shocked and astonished. 'I will return to the house with you,' he exclaimed. 'Never fear, the matter will be cleared up. There is some roguery at the bottom of it. But it seems to me an unpardonable proceeding on the part of your father-in-law. He ought to have known you better.'

'He does not like me. Still, for Lena's sake'—He stopped, for the first time overcome.

'Let us return to the house quietly; there is no occasion to make such a scandal public,' said Sir Hugh, placing his hand kindly on the young man's shoulder. 'No one shall know it here. The matter will soon be cleared up. You will leave Mrs Gravenor with us until you come back to finish your visit.'

It was an easy matter to hoodwink Lena, although she could not clearly understand why three persons should be despatched to fetch her husband, when a telegram from her father would

have answered the purpose equally well. But she had been brought up in subjection, having lost her mother in her infancy, and took things meekly.

'Bless you, my dearest! We shall soon meet again,' said the Captain, embracing his wife.

But Lena wept. 'This is our first parting,' said she, 'and it seems cruel.'

'I shall be back again in a few days,' cried he.

Alas! sad unexpected events happen in the world. Captain Gravenor never returned. In spite of his solemn assertions of innocence, he was obliged to stand his trial for forgery. There was only circumstantial evidence, but that went against him. Many friends and brother-officers came forward to bear witness as to his honour. Their testimony went for nothing.

The sum was only for five hundred pounds; but he was known to be in straitened circumstances. His father-in-law would rather have lost the sum than had the affair made public. As it was, he was one of the last who had intimation, and it was too late for hushing it up.

The forgery had been detected by a Mr Thorel, a very important person at the bank, the nephew of the late Mrs Desborough, Swiss by birth, and head of the foreign department.

When Captain Gravenor heard who was his accuser, he was astounded, as well he might be. He declared the cheque for five hundred pounds had been handed to him by Thorel himself. This Thorel emphatically denied. Unless proof is brought to the contrary, one person's word is as good as another's.

The Captain stated that he and his wife were staying for a few days in Portland Place, before starting for Perthshire. They returned to the Wellington Barracks one evening after a dinner-party. Mr Thorel was also there. Having said adieu to Mr Desborough and others, he was following Lena down-stairs to the brougham, when Thorel stopped him on the landing at the first flight of stairs, where they were quite alone, and whispering, 'My uncle desired me to give you this cheque,' slipped it into his hand.

'Give Mr Desborough my most grateful thanks,' he had replied. On reaching home, he told Lena of her father's present, at which she was much pleased. He cashed it the following morning before starting for the north.

Mr Thorel emphatically denied having given the cheque to Captain Gravenor. He had certainly spoken a few words to him on the landing, but they merely referred to his intended journey of the morrow. No one had seen the transaction.

It was some days before Mr Desborough discovered that a leaf had been purloined from his cheque-book, which he kept in a drawer of his writing-table in the library. This led to investigation; and on Mr Thorel's examination of the cheque that Captain Gravenor had cashed, he at once pronounced it a forged one.

Captain Gravenor had sat reading in the library the day of the dinner-party. All went against him. Mr Desborough deposed that he had occasionally sent both his daughter and her husband cheques, but never to so large an amount. He had received a short letter from Gravenor when he arrived in Perthshire—it thanked him for his 'great kindness.' He was at

a loss to know what he meant, but set it down to the friendliness he had recently shown his son-in-law, with whom he had not been on the best of terms.

Captain Gravenor was pronounced guilty by most people; but all wondered at his short-sightedness, not to say clumsy management in the fraud, which he might be sure would be almost instantly found out. Doubtless, he calculated on the transaction being looked over, for his wife's sake, as it would have been, had not Mr Thorel made the affair public at once.

A money-lender named Issachar stated that he had recently received the last balance of an account owed by Captain Gravenor; and the testimony of this man in his client's favour was remarkable. He had transacted money matters with him for several years, even before the young officer attained his majority, and had always found him strictly honourable; in fact, he was one of the few persons in the world whom he would trust implicitly. He insisted upon handing back the two hundred pounds he had received from him, to the banker. 'I refuse to keep it,' said he; 'but I consider Captain Gravenor's debt paid just the same.'

The unfortunate Captain was found guilty of forgery, and sentenced to transportation.

To those who believed in him, the case was a mystery. As time went on, he was forgotten, his name being seldom mentioned even by those who had been his friends—by his wife, never.

AMONG AMERICAN MINERS.

You have seen, perhaps, a Durham coal-mine, and have noticed the grim aspect of Durham coal-heavers. Miniature mountains of slag and shale encompass the mouth of the pit. A filthy sooty-black liquid distils itself from the refuse heaps. The very sky looks black in the face, and Nature out of sympathy with the mummy-like beings who swing themselves into the darkness and upheave the bowels of the earth. You hear the clangour of titanic hammers, the faint ringing of countless anvils, and the deadened clanking of heavy chains. Tall chimneys shoot skywards and smoke lazily.

The above picture presented itself as a forcible contrast to our mind as we stood for the first time at the entrance of an American silver mine. Instead of a leaden-eyed miserable heaven, a few light clouds met and kissed each other. The scoria round the edge of the shaft looked as though, if water were poured upon it, it would hiss and smoke. A little wooden structure containing pit-tackle and machinery was thereabouts the only sign of mining life. A gaunt giant clad in blue overalls, a red flannel shirt, and a pair of hob-nailed cow-hide wellingtons, was the only above-ground representative of the creatures who, according to the imaginative journalist, earn such fabulous sums of money.

Equipped with a marvellous folding candlestick and a box of matches, my companion and I took our stand at the head of the shaft. There was no danger, as in a coal-mine, of being blown up by fire-damp or poisoned by choke-damp. 'Ready?' said the man at the wheel. 'Yes;' and down we dropped six hundred feet. That buried-alive sensation which asserts itself underground had

barely time to make itself felt before we were relieved by a gleam of warm colour which reached us through an aperture that hardly admitted of the passage of a human body. Here a rich vein of silver ore had been struck and followed. With the aid of pickaxes and a few beams for stooping, three or four men had worked their way from darkness to daylight—had tunnelled through solid rock to the side of the hill, a distance of three hundred feet. The vein had yielded upwards of fifty thousand dollars. Yet to all appearance the ore was as wanting in value as common road stone: the most powerful microscope we had revealed not a vestige of precious metal. The assayer pronounced it to be twenty-five dollar ore; that is to say, ore of the value, in English money, of five pounds per ton. Truck-load after truck-load was despatched to the company's mill, where thirty iron stamps pounded it with a seemingly purposeless frenzy and savage exasperation, as if angered by its resistance. When in a state of pulverisation, this seemingly worthless powder was passed through a quicksilver bath. The silver amalgamated with its volatile companion, and the debris, under the name of 'tailings,' escaped down the gulch.

Farther on we came upon the miners. These were working singly and in groups. Some were descending, some ascending, others working laterally. 'They follow the seam, wherever it goes,' explained the superintendent. They were rough specimens of humanity, these men, who throughout the livelong day hammer by candlelight at solid rock. Very grim, pallid, and determined were their faces, and very wild and bright their eyes. Their task looked as unending and as hopeless as that of stone-rolling Sisyphus. Little trolleys, about twice the size of wheelbarrows, were running along all the principal levels. Into these the ore was shovelled, run to the mouth of the shaft and emptied into a truck, which, when full, was hauled up and shipped to the company's mill. From the minor levels the ore was carried in baskets to the trolleys, a work in some cases difficult and dangerous. The mill was situated at the base of the hill. To it a railway track had been laid down, so that a truck-load once started descended by its own volition.

Conversation with the miners was strictly prohibited, doubtless lest information so obtained should be used on the Stock Exchange or by the press. To gain admission was no easy matter. The public and the shareholders are, therefore, at the mercy of the superintendent and the directors. There is nothing to prevent false reports as to the state of the mine being circulated, or unfavourable telegrams being suppressed by interested directors. 'Hence many a man,' as Dickens well puts it, 'has locked up money in his strong-box, like the man in the *Arabian Nights*, and opening it, has found but withered leaves.' Superintendents will thrive and managing directors grow fat in connection with the worst of mines, as long as men will 'put up' money to work them.

The mining camp was a straggling assemblage of picturesque little houses, all built of wood. There were queer little shops kept by Chinamen; and quaint little huts fearfully and wonderfully made, in which ubiquitous Indians lived. Romance-destroying civilisation had even here begun to assert its power. A session of the Circuit Court

took place twice a year, and to it were submitted all disputes about mining claims, the most fruitful source of disagreement. Provisions were brought by a railroad which ten years since had not been conceived in the wild brain of Fancy herself. A new doctor had arrived and affixed a brass plate to his door. His rival had departed, taking with him a case of surgical instruments at which a city practitioner would smile. It consisted of two bowie knives—one ingeniously hacked and filed into a saw—a pair of pincers, and some buckskin cut into slips for ligatures. He could point to many a difficult operation successfully performed with these rude instruments; but he recognised the uselessness of opposing Science, who, with calm, assured tread, is everywhere driving unskilled labour from the field. Holloa-a-hole-in-the-air, an Indian chief, who a few years ago sought to ornament his wigwam with scalps, had been driven by a troublesome molar to visit the pale-face medicine-man. He submitted to its extraction with a 'Ugh!' of satisfaction, and now almost worships his benefactor from afar.

It is not well to question American miners as to their previous history. Some of them are perhaps fugitives from justice. 'Do as you would be done by, or take the consequences,' is their unwritten code, which it is not well to violate. They are free men, and so long as you are 'square' with them, will treat you with respect. 'Poker' is their besetting sin, and rye-whisky—which is sometimes termed 'railroad,' from the rapidity with which it hurries men to the end of their journey—their favourite stimulant. Champagne they know not, even by name. Successful gamblers and lucky owners of claims who have chanced to be gamblers have, it is true, indulged in unheard-of extravagances. Their eccentricities have been made universal by the imaginative journalist, until there are not a few who believe that miners ride to work and drink champagne by the gallon. As a matter of fact the American miner is another sort of creature. Like his English cousin, he has to fight tooth and nail for a living, and he has far fewer comforts. That short, thickset, beardless man, of cheerful and intelligent aspect, is the only man in the camp who ever owned money. He sold a mining claim for twenty thousand dollars (four thousand pounds). He 'ran' Mike's hotel for a week; for a week the whole camp ate, drank, and were merry at his expense; then this best-natured fellow in the world went to 'Frisco' to play for higher stakes than the camp afforded. That was his ideal of happiness. A fortnight later he turned up again 'cleaned out.' Fate had been 'agin' him. He was too much of a gambler to rail at Fortune. He returned to work as a common miner at three dollars per day.

An outcry having arisen against the Chinese, we were anxious to see how 'John' comported himself in a mining camp. We had thought that oil and water were scarcely less reconcilable to each other than was the Chinaman to the European or American: that he acted as a red rag to the Australian and American alike. His great crimes, or objectionable traits, seemed to be that he lived on nothing, undersold and under-worked white men, and carried his gains and even his bones to his own country. Whatever the Chinaman may be in a great city, as a servant he is intelligent, frugal, peace-loving, law-abiding,

and greatly valued by his employers. Chinese communities may be immoral and honeycombed with secret and treasonable societies; but the Chinese servant of many an American household is a treasure, a *sine quâ non*, doing with equal readiness and skill the labour of a man and the work of a housemaid. Female servants, it must not be forgotten, are not common in America, except in cities, and their duties are considered beneath the dignity of American citizens or emancipated negroes; hence the great demand for Chinese servants in outlying districts. Americans dislike to be pitted against coloured labour; but we do not believe the dog-in-the-manger policy of expulsion finds general favour among them. The mental architecture of the Chinaman is unique: he is not a sociable creature. He is stolid and excessively reticent. Only once do we remember to have seen a Chinaman animated or curious. My boots had been given to Chi Ling, the boy-of-all-work. The following morning he appeared at my door gesticulating wildly, with boots and boot-trees in his hands.

'What he for, sirez?'—pointing to the trees. 'What he for?'

I endeavoured to explain.

'Me sabe, me sabe. Chi Ling no fool. You makee shoes.' And Chi Ling departed with the satisfied air of a man who has solved a mystery.

Mining camps are much smoother places than they used to be. The new and improved mode of travelling for a time threw things out of gear. For a while the fugitive from justice had things much his own way; he had but to reach a railway station unobserved. 'Thud, thud, puff, puff,' went a shrieking monster, and he was whisked past towns ten, twenty, thirty, a hundred miles away. Pursuit was physically impossible; and a mining camp was a common and secure city of refuge. Now, all that is changed. Click! click! goes the electric telegraph, and where is he? If he succeeds in embarking, whirr-r-r goes the Atlantic cable, and he is caught like a mouse in a trap. People who are 'wanted' cannot easily leave this country, even for their country's good. The speculations to which the flying machine gave birth in the mind of Addison are as nothing to the facts accomplished by steam and electricity. The world of to-day is a world of rapid motion and rushing railroads. The iron horse is a cruel destroyer of romance. Passengers used to feel a positive joy in getting home safe; now there is no such thing, for that is a matter of course. Crafty cheats of all descriptions have perhaps been multiplied, and now swarm in society 'as thick as the gay motes that people the sun-beam;' but long-lived systematic robbery by violence, even in America, is a thing of the past. You are much more likely to be the victim of little tricks such as Ah Sin played upon Bill Nye and Truthful James than to get a brace of bullets put through your head by that daring assassin Captain Cutthroat.

Miners are not what they were in the brave days of the Roaring Camp; they pay some attention to 'such minor details as ears, eyes, and fingers.' All stories of the sensational romancist now properly begin with, 'Once upon a time.' Dark deeds are not unknown in the West; but the 'properties' which would make them romantic are gone. The miner chooses to encase himself

in a crust of outward surliness; but under his rude exterior beats a heart of flesh and blood, a heart which under the alchemy of a kindly touch will blossom into kindest fruit and flower. Old Kentuck died clasping in his arms the child he endearingly called a 'little cuss.' And we may hope that the time is not far distant when the use of the revolver will have slipped into disrepute or desuetude, and when mining camps shall have lost the unenviable reputation that they have hitherto borne.

EUNICE: A RUSTIC IDYL.

By the Author of 'The Way of Transgressors.'

THERE was a scent of flowering beans in the air, the vetches were in blossom, and the bees were toiling out their six weeks of existence among them as though life would never end. Eunice South stood at her own door and looked away towards the harvest-fields. The house faced west, and she raised her hand to shade the waning sun from her eyes. She was a heavily-built girl, with a colourless, plain face, a face that would have been uninteresting only that the eyes were beautiful and the mouth patient and sweet. Eunice's heart was craving for the open country and the breadths of undulating corn-land, craving perhaps most of all for a little companionship with the young and glad and gay.

Most girls of Eunice's class at Grimpat worked in the fields at harvest-time, and so earned the price of a new gown or a set of ribbons for Sundays; but old Joseph South would not hear of such a thing for his daughter. The manners of the fields were rough, and he had the ideas of people who have seen better days.

Eunice was a lonely creature, reputed proud because she was so shy and humble. What she had to be proud of the neighbours did not know, and so resented the quality they ascribed to her. That she was a good girl, industrious, dutiful, steady as old Time, they would have admitted; but these are not the attributes one looks for at twenty years of age.

There had been a time when the Souths were very well-to-do, when Joseph's shop was well stocked and his work very popular; but the curious kind of decay that sometimes creeps over little hamlets in a single generation had reached Grimpat, and Joseph South's prosperity perished with it.

Eunice was quite an adept in keeping up appearances, in making things do, in saving, and patching and darning; but show is not a sustaining thing when the larder is sometimes as bare as old Mother Hubbard's cupboard and there are three men to cater for. An exclusive diet of bread and tea does not sustain the courage or improve the temper. Old Joseph could stand it; but the boys grew weak and weedy on it; and young Joe, in a fit of rebellion, enlisted. The father said it was a good riddance; but they all had the feeling, universal in country districts,

that a son sent to the service of the country is a son thrown away.

Eunice was nineteen years of age before she had ever been five miles from Grimpat. Then a friend of hers got married at a distance, and having made a good thing of it, invited her old neighbours to appreciate her prosperity. In succession, Mrs Gregg's girl-friends were brought from Grimpat to sit in her best parlour and admire the hair-covered furniture and the large-patterned carpet, and to sleep in the close little best bedroom that overlooked the fowl-yard.

Eunice's delight when she was invited must be left to the imagination. Think of your brightest dream made actual, and then you will understand a little of the girl's emotions as she packed her small wardrobe into the old skin-covered trunk that had once held a portion of her mother's trousseau. There was no self-consciousness about Eunice; she never thought how her shabby clothing would strike Mrs Gregg, or what impression she would make at Tregby.

It was July weather, and the earth was pompously attired, the fields an emerald, the sky a sapphire, and the purple widths of heathland breaking here and there into a blaze of golden gorse. The girl scarcely seemed to breathe as she was swept through miles and miles of rural panorama. And then the wonders of the little town when she reached it: the station, that seemed to her so busy and so bustling; the noise of vehicles; the crowd of foot-passengers; and the magnificence of such shop windows as Eunice had never hitherto conceived! She was all eye and ear and parted lips, that now and then gave little gasps of astonishment.

Never had Mrs Gregg been so successful with a guest; never had she been offered so full a cup of honest admiration. She discoursed of the magnificence of Tregby, and her husband's position and importance there, all the evening; he, good man, interrupting her now and then with a deprecating 'Jane, Jane!'

Eunice slept little that night. Perhaps the unaccustomed luxury of Mrs Gregg's best feather-bed had something to do with it, or perhaps she was only resolving the enigma of how an opening could be found for Willie in this prosperous place. She and her father were fixtures at Grimpat; but Willie was young and had a right to opportunities.

Reticence is instinctive with shy people. It never occurred to Eunice to take either Mrs Gregg or her husband into her confidence, before she had evolved a distinct plan for herself.

Three days after Eunice's arrival, Mr Henry Watkins stood at the desk in his own shop making out a bill or two. Mr Watkins was the type of young tradesman that is not infrequent in provincial towns—a man who read a little, attended local debating societies, belonged to a cricket club, and wore proper cricketing flannels when he joined the local Eleven on Saturday evenings—a man who managed his business thoroughly, nevertheless, and was popular with his neighbours. He was rather a good-looking man, too, not quite thirty yet, with thick dark hair, and the keenest eyes Eunice had ever seen. Eunice passed and repassed the plate-glass window half-a-dozen times before she found courage to enter.

'I want to see the master,' she said, when she was observed.

'I am the master,' Henry answered with a little air that was perhaps natural.

Eunice blushed through her thick pale skin. She would have liked an older, more everyday master. 'I called to ask about work for my brother.' Her eyes were as bright and humid as those of a gazelle; except for that, she was rather ridiculous with her black cotton gloves, her jacket years behind the fashion even of Tregby, and her shabby battered old hat, with the rain-washed feather asserting itself rampantly in the crown.

'I don't know if you need a journeyman,' poor Eunice went on, feeling now on what a fool's errand she had come. 'I'm a friend of Mrs Gregg's; my father is a shoemaker at Grimpat; and my brother, who is nearly eighteen, knows the business. Grimpat is a small place; there is not much work there; and I thought, seeing Tregby so busy and so prosperous, that maybe there might be an opening.' She was pathetic in her crimson confusion, and Mr Watkins was a little moved by the eyes that had now ceased to look at him. He was not unaccustomed to young persons making excuses to call on him; but he felt that Eunice's errand was genuine.

'I had not thought of an extra hand,' he said slowly; 'but if I required one'—

'Thank you. It was a liberty to call, I know.'

'Not at all—not at all; and if you will leave the name and address, I will think the matter over.'

She gave the address, and then hastened out, her sense of guilt and folly going with her. Nothing had come of her enterprise, and therefore she told the Greggs nothing about it. People like Eunice, when they begin to have a secret, must continue to keep it, explanations become so laborious.

Two days later, Henry Watkins called at the Greggs'; but he did not enter the parlour, and he made no mention of Eunice; he only said that the Tregby Cricket Club had challenged the Overhill Club, and that he could get seats for any friends who cared to look on at the match.

Mrs Gregg would much rather this invitation had come in Eunice's absence, for, though she liked her, she thought her a perfect scarecrow, and did not care to identify herself in public with her; but the invitation was too good to be declined, and the best had to be made of the visitor. Mrs Gregg trimmed Eunice's old hat tidily herself, and lent her one of her own smart gowns; and when Eunice clambered into the trap that was to carry them to the cricket-field, there was not in England a happier creature. The world seemed beautiful to her, all made up of music and motion. The summer hum, composed of voices of winged things, the rustle of leaves, the sighing of the breeze in the tree-tops, was scarcely overborne by the soft footfalls of the pony on the padded dust of the high-road. At that moment Eunice realised the full joy of living. To drive like a lady, to have a seat in the enclosed space like a lady, to be well dressed, and surrounded by kind people—if there was a happier experience in life, Eunice did not know it. If the white figure in the distance, who was said to be Henry Watkins, and who was said to distinguish himself, was inextricably mingled

with the joy of the hour, the girl was quite unconscious of it.

But the best things come to an end. Eunice went home on Monday, and the narrow life at Grimpat, with its dullness and its restrictions, was resumed.

A whole month passed, and it was in that time that Eunice used to stand at the open door and look away towards the harvest-fields, desiring she knew not what. Henry Watkins had forgotten what she asked of him; but indeed what right had she to expect he would remember, or to proffer her absurd request?

Johnnie Tollet was the postman at Grimpat, a youth who wore no uniform and had no dignity to keep up, dignity not being expected for the pittance he received. As he came up the street, carrying the three letters that constituted the mail for the entire village that day, he caught sight of Eunice by the window, and tossed the letter addressed to her into her lap through the open sash, saying: 'From your sweetheart, Eunice.'

Eunice looked up and nodded. She had letters now and then from Mrs Gregg and others. But this was a different letter—very brief, written in a large, black School-board hand:

DEAR MISS SOUTH—I expect to be in your neighbourhood on Wednesday, and shall call to see your brother, and to settle the matter about which you spoke to me, should he prove suitable.—Very truly yours, HENRY WATKINS.

The beating of Eunice's heart almost suffocated her. She thought it was joy for Willie, and dreaded lest he should undervalue the opening offered him. She had not spoken on the subject to any one, perhaps from the thought that premature talk is unlucky—perhaps from some other motive; but she told Willie now, and was provoked that he treated the matter as an every-day occurrence.

When Joseph heard the news, he seemed displeased—said he did not want to lose all his children—that there was work for the boy at home; and that Eunice, like all her sex, was too prone to meddle. But when he saw Mr Watkins, he was mollified. Prosperity and youth and clear-headedness and self-confidence are elements in a pleasing whole. The old man talked more frankly to this stranger than he had done to any one for years, boasted a little of his own ability and past success, and blamed bad luck that his prosperity was over.

Willie was engaged, of course, at a fair salary, to be increased by results, and was to go to Tregby the following week.

Things seemed better after Willie went away. He wrote home cheerfully. He was glad of the change; and then there was more work left for old Joseph, and one less to clothe and feed, which was a consideration.

But a fresh trouble was in store. The Souths seemed doomed to trouble. Joe had tired of the army; the discipline nagged him; he saw no meaning in it, he said; and his pay never seemed to reach him for fines. If he could be bought off, he would pay the money back when he earned it; and he hoped his father would do this for him. But old Joseph had nothing saved, not

even the few pounds necessary; and if he had, he would probably not have given it. When people took the law into their own hands, as Joe had done in enlisting, they had to abide the consequences, he said. When Joe received this answer, he took the law into his own hands again, and deserted.

Oh, the horror of that night to Eunice, when he entered dusty and footsore and fell on the food that was offered him like a wolf! The wrath of old Joseph, and the sullen defiance of the culprit. Return! Not likely. He had suffered enough before he ran away. It was for them to decide whether they would help him out of the country or give him up. For his part, he did not care much which they did.

Now, neither Eunice nor Joseph understood what penalties befell a deserter, and Joe took good care not to enlighten them. They knew that military law was inexorable, had no pity, and made no excuses, and they had heard of deserters being shot. That Joe would receive severest punishment, whatever that might be, they knew; and many a night they lay awake picturing him with bandaged eyes in front of a platoon of soldiers. They kept him hidden till they managed—Heaven knew with what dire difficulty—to scrape together the few pounds necessary for his escape, and then they got him out of the country. When he had gone, they buried at dead of night the uniform he had worn when he came home, feeling, poor souls, like murderers as they did so.

Under her troubles, Eunice grew colder, more reserved, prouder the neighbours said. She hardly ventured out of doors now, being afraid some one would look at or question her. There is a great deal of that timidity among villagers, which makes them hate to go abroad unless they can go in company or on an errand. Eunice loved the open air, the bird-voices, the shifting clouds, and all other rural sights and sounds; but she lived preferably within four dull poor walls, because she was unhappy and afraid.

That visit to Tregby rose up before her now and then like a dream. Surely she only fancied she had had such happy days.

There were times when the girl felt quite old and settled in the groove in which old maids live. Other girls, her seniors by many years, had their lovers, their friends, their frolics; but such things did not come Eunice's way, and likely never would. Perhaps it was her own fault. There was no one at Grimpat, Eunice would have cared to be on intimate terms with. Perhaps she had her ideal; but it was an ideal so remote, so consciously beyond her, that when Willie wrote home, 'The master is getting the house done up; he told me yesterday he is minded to marry before the year is out,' the curious heart-pang she suffered felt only like a deeper depression. It was not likely that she had ever thought of Willie's employer in connection with herself; no one could have contemplated Eunice with more contempt than did Eunice herself at this thought. A man like that! Of course, he would marry some one like himself.

Eunice took it into her head that they should have a hot supper that night; even if Joe's debt weighed on them, there was no reason why they

should starve. She did not understand the restless motive that prompted her to do something unusual, to put a good face even before herself, in that curious sick depression which clung to her. When you can make a feast for yourself, you seem to rejoice that other people prosper and that other girls have lovers.

Eunice put on her old hat, and took the little basket with a lid in her hand. She was going to commit an extravagance—to buy some of Mrs Mallet's famous big eggs, and a bit of bacon at the village shop. There were times when Eunice felt that her blood was thin, and grew hungry for a taste of meat. But once she was out in the sunshine, she forgot her errand and her longing for luxurious living, for the wide landscape was all around her, the irregular fields undulating away to the hills. The air was strong and pure, and fragrant with the breath of flowers. At her feet the myosotis and harebells bent their delicate heads in the breeze that crept out of the distance. Eunice sat down on the fence, the basket in her lap, her eyes misty and faraway. It was good to be out here alone, under the shifting clouds, with the sense of silence and vastness and God around her. She did not put this into words; she only felt that her troubles seemed trivial under the remote sky, and she resolved that in the future she would invent errands oftener. And then she stopped thinking, for a man was coming with long swinging strides over the narrow path through the grass. He was not a Grimpat man—no Grimpat man ever walked or dressed like that. She sat gazing at him with the unabashed curiosity of a fearless wild creature, and then she rose with a sudden husky cry. What bad news did he bring?

'Willie,' she said breathlessly—'Willie?' The little basket rolled away from her lap and ignominiously buried its mouth in the grass.

'Willie is well,' Henry Watkins answered. 'Did I frighten you?'

She stood staring at him, plucking a little at her dress, as though something suffocated her.

'There is no bad news?'

'None in the world.'

'Then what brought you?'

The young man laughed. 'I can't say you are very hospitable. I came for a trip to Grimpat, as I did once before. I am taking a holiday.'

'And you were coming to see us?'

'Straight.'

Eunice bethought herself of the supper, which was doubly necessary now. She still felt in every limb the shock of his unexpected appearance; but she had no intention of letting him know that. Of course it was owing to her secret about Joe that she was so easily startled.

'I have an errand to do. But father is at home. If you will go straight on, I shall be back by-and-by.'

'Might I not do the errand with you?'

'Are you not too tired?'

'Not tired at all.'

He was in excellent spirits; but that was only natural, when she came to think of it.

'Are you pleased with Willie?' she asked after a pause.

'Thoroughly pleased.'

'I was afraid when I saw you that perhaps he had got into mischief.'

'Not he—steadiest fellow I ever had. No. I came on my own account, to see this pretty bit of country again.'

'It is pretty. I was just thinking that when I saw you.'

'It is a prettier neighbourhood than Tregby.'

'Well, I don't know that.'

'You liked Tregby?'

'Yes.' She could not say any more, the slow colour rose in her face at the bare recollection.

'I came to ask you—to tell you'—He stopped, stammering; and she came to the rescue kindly.

'Yes; Willie told me. I suppose you mean what he wrote about?'

'What?'

'That you are going to be married.'

'It all depends on the girl. I have not asked her yet. I don't know that she'll have me when I do.'

'I don't think there's much fear that she won't,' said Eunice, out of the heart of her conviction and innocence.

'I don't know. I'm not good enough for her—not half good enough.'

'I suppose she is very nice,' said poor plain Eunice, with a little sigh.

'She is; and as good as gold. How can I praise her more, Eunice, than to say it's you?'

'Me?'

'Yes; it's you.—Why, I've loved you since the first minute I saw you, looking at me with your big, beautiful, good brown eyes!'

Nobody ever knew what he had discovered in her, she least of all; but that piece of ignorance on the part of a wife is very conducive to a happy household. To this day the Grimpat people have not recovered from the shock of Eunice's grand marriage; and when they discuss the matter, solemnly assure all listeners that it must be a very lucky thing to be poor and proud and plain.

RONDEL.

'Love heeds not Time!'

'Love heeds not Time!' the foolish Rose breathed low,
When, ere her season, she began to blow,
Wooded by the amorous breezes of the Spring,
Beguiled by the fair look of everything;
The gold-bellied Crocus mocked with echoing chime:

'Love heeds not Time!'

Ah, eager Rose! far better 'twere to wait,
E'en though the Summer make her coming late.
'Tis true the first kiss of the sun you get,
The pearliest drops of dew your petals wet,
But soon that dew shall weep congealed with rime:

Love heeds not Time!

There is no pity for her, no redress;
The cruel frost wrecks all that loveliness;
So, sun-forsaken and betrayed, she dies
With crystal sorrow frozen in her eyes;
Yet, faithful, sighs with her last breath sublime:

'Love heeds not Time!'

A WORD OR TWO ON WORRY.

'An ant is a wise thing for itself, but a shrewd thing in a house;' so, a worrying person, however well intentioned, is an irksome presence in a home. Such a one, out of sheer affection, will worry and persecute their belongings into a course directly opposite to their wishes. By oversolicitude and importunity, a good, kindly-disposed woman will effectually rouse resistance; and then feel and look like a martyr because her advice, so reasonable and unselfish, is neglected. Who does not remember the true but unpalatable formula with which her remonstrances will not seldom wind up: 'It is all for your good, you know?' The occasion may be a slight one—the contention concern perhaps only the donning of a greatcoat. Young people cannot estimate the amount of worry: the anxious glances cast at the clouds, the fears of a downfall, the preparations to receive the half-drenched 'wilful Will'—any more than the anxious house-mother enters into the pleasant sense of endurance—the mad delight in rain, or wind, or snow, of the said wilful Will. Hence no doubt arose the bitter proverb, that young folks think old folks are fools, but old folks know young folks to be so.

Some of the domestic worries which fall chiefly to the lot of women—such, for instance, as the imperfectness of service—might, we think, be assuaged by a consideration of the imperfection of all things, even themselves; and still further, an admission of the possible worry they—dressed in a little brief authority though they are—may be to those 'beneath them;' and whose complaints, it is just possible, may be more justified by facts even than their own. For there is little to restrain a fidgety superior from giving free and unwholesome vent to his or her fidgetiness, even though a whole household be upset by the 'setting down' it has been deemed necessary to administer to the peccant inferior. They do not sufficiently reflect that the other side being bound not to answer, except at peril of losing their

place, generosity should keep them, the superiors, in a measure tongue-tied. Nothing crushes all spontaneity out of service like exactions coupled with continual carping comments. There are no reasons against, and many reasons for, our servants being among our best friends; but are they so, as a rule? 'I have been so worried to-day' is the welcome with which not a few husbands are received when they return home, harassed it may be by the cares of business; and then he has to listen, or to shirk listening, to a recapitulation of all Jane's or Martha's stupidity and 'cussedness.' He mutters but a gruff word in reply, perhaps; and the wife—if, like 'Willie's wife, she is not over-wise'—is nettled at his want of sympathy; and the worry is allowed to widen and ripple over the whole expanse of the family circle.

Men, as a rule, do not expect so much of their dependents as women do; and are—and are not above showing that they are—more grateful for their services. They estimate the value of a good servant as they appreciate a conscientious and capable clerk, and treat them both with the consideration that is their due.

Interruptions are a pregnant source of worry—interruptions to conversation, to letter-writing, to meditation; but to work, interruption is a serious hindrance. The thread of a conversation may be picked up again, the letter resumed, the line of thought recovered; but to have to reply to various questions, to make decisions foreign to the subject in hand, tries the nerves and frets the temper of the steadiest worker. It is difficult, then, especially in official life, where the personal tie between principal and subordinate is mostly lost sight of—it is difficult, then, to regard even the blameless bearer of the interruption with equanimity. Vexation is shown not in words perhaps, but in manner: the aged subordinate who has brought the interruption, instead of being invited by a wave of the hand to take the chair close to him, is kept standing for the best part of an hour. This is unjust, and the injustice is felt as a worry by its recipient.

'If I had time, and was not interrupted—not worried, time to study, time to think, time to mature, time to spare'—we are apt to fancy we could do fine things. Nevertheless, experience compels us to admit that, with rare exceptions, it is just this worrying want of time, this goad of necessity to do a thing and be done with it, that keeps the common ruck of humanity at work at all. This sets us in motion; but being in motion, there is every reason why we should endeavour to get the better of worry in our work, to control it and ourselves. Whatever provocation or misconception we may encounter from sarcasm, taunt, or calumny, it is well for us if we can bear it, if not nobly, at least with indifference. To retain our calmness 'e'en though china fall'—to keep our temper in spite of adverse, misrepresenting criticism, shows a certain greatness of soul. And this greatness of soul belongs, be it remembered, to no one set of circumstances, to no particular class. It shows itself quite as often in the uneducated as in the cultured; it may be known by its calm. The soul thus endowed never hurries or worries, and, more wonderful still, it never allows itself to be hurried or worried. It goes calmly on through the daily tasks appointed it, and is the refuge and repository of every one else's worries, just because it seems to have no worry of its own. It is condemned, it may be, to what in our eyes seem trivial occupations: the spirit has been finely touched, we see, but the issues are beyond our ken. Yet no one who has observed the effect produced by such a character in a household will lightly undervalue its peaceful cloud-dispelling influence. And as it is not every home that possesses an example of such beautiful behaviour, it concerns all who are in authority to cultivate this sweet serenity, in which worry cannot live unrebuked.

Old worries are rendered easier to be borne by custom; like the high-heeled shoes, the stays, or the tall hat, to whose ugliness or inconvenience use has blinded us; indeed, there are those who are most sensible of a worry when it is suddenly removed; like the Admiral whose sleep was not disturbed by the accustomed explosions of the morning gun, but who was awakened at once by unaccustomed silence.

Some women, and, according to Thackeray, not a few men, are worried into matrimony. 'I married him to get rid of his importunity,' sounds like a paradox; yet it is not without its truth, and the woman capable of taking such a trenchant means of ridding herself of worry, not seldom shows her vigorous good sense by afterwards making the best of her bargain. We all doubtless remember the story of the two pilgrims on their road to Rome, each with a dozen or so of peace in his 'wooden shoon,' and how that the one limped and grimaced, and worried and grumbled; while the other paced placidly on, just because the latter gentleman had taken the precaution to boil his peace before placing them in his shoes. If, now, we pick the worries out of our minds, macerate them, reduce them to pulp by a process of comparison, add to them a seasoning of patience, a pinch of fortitude, a dash of cheerfulness—treat them, in short, as the amiable Mr Toots proposed to treat our raw materials, 'cook 'em,' we might hope to pace forward on our pilgrimage with

something of the feeling of relief attained by the astute wayfarer, who had reduced his worries to what we saw styled the other day in an English newspaper 'a trifling minimum.'

As evil is wrought by want of thought, what a worry to some children is the nickname carelessly bestowed upon them by some cheerful senior. It is not ill natured, but it is apt, and it sticks and sticks and bites into the child's mind, embittering its days and haunting its nights. He may give no sign, never openly rebel against its tyranny, but the heart knows its own bitterness. Hearing the old name once more as a man, he will laugh; but while he laughs, he knows that it has given him many a heartache in years gone by, and that the scar remains though the wound has long since ceased aching. Another source of more transient but of oft-recurring worry is over-accuracy in trifles. Many otherwise sensible people will overweight a passable story with needless particulars, or, worse still, interrupt you in an anecdote so slight as scarcely to bear repetition, by a correction of the day of the week or the hour of the day on which it happened. But if accuracy, over-accuracy, be sometimes an impertinence, what is to be said of the 'self-sufficient and insufficient' young gentleman who regards exactness as 'a mere matter of detail,' as he phrases it, and whose inaccuracies are as severe a test of the power of bearing worry as the most heroic soul could desire?

But since the catalogue of worries is all but interminable, we—lest we, too, should prove an exemplification of the point under consideration—will draw to a close; remarking in conclusion, that worries, like weeds, grow rankest in waste places, in neglected gardens; and though there be some so fast rooted that, like the quitch or couch-grass, it is next to impossible wholly to extirpate them, we may yet, when they are obtrusive, cut them over the head with the help of the switch with which Disraeli provided us, when he bade us reflect how small this same worry would probably appear to us this day twelvemonth. And if we are not strong enough to do for ourselves what time will do for us, let us take example by a man who showed his wit and wisdom not more in his works than in the habitual cheerfulness of his life, of whom it is recorded that he treated every unalterable accident as if it were the best thing that could have happened.

DUMARESQ'S DAUGHTER.

CHAPTER XL.—WHICH LINNELL?

FOR the next two days, in spite of his fears for Psyche's health, Haviland Dumaresq lived once more in one of his wild old-fashioned opium-dreams—without the opium. An opium-dream actually come true at last! Psyche rich! Psyche provided for! Psyche her own mistress in life after all! Psyche free to choose whom she would; to bestow herself with regal imperiousness where she willed; to carve out her own future, no man compelling her. His waking vision had worked itself out, in a most unexpected and inconceivable way! Psyche was at last where he had always wished her to be, and never truly hoped or expected to see her.

It was grand! It was glorious! It was sublime!

It was magnificent! What was Linnell's life to Psyche's happiness?

One nightmare alone intervened to mar his triumph. Not Psyche's blindness. That would surely come all right now in the long run. The mistress of so great a fortune as that had nothing to do but open her eyes and see straightway. His nightmare was the fear lest Sir Austen, if indeed it were really he who lay ill at Biskra, might manage to get the will set aside, and to claim his own share in the Linnell succession. That nightmare weighed upon his spirits not a little. He occupied himself for most of the intervening time, before Cyrus returned, with writing an interminable letter to Burchell and Dobbs about this alarming and distressful contingency.

There was another contingency, too, on the cards of course: the contingency that the man who lay ill at Biskra might prove to be, not Sir Austen at all, but his cousin the painter. That chance, however, Haviland Dumaresq could hardly fear, and dared hardly hope for. Did not even the man's own lawyers give him up for lost? Had not probate been granted for the will by officialdom itself? Was it likely anything would ever again be heard of him?

Yet if, by any chance it should really turn out to be Charles Linnell, Haviland Dumaresq felt sure in his own mind that all would be for the best, and Psyche in the end would be no loser by it. For if Linnell left her his heiress when rejected and refused, why surely when he turned up again, safe and sound at last, he could hardly do anything else than marry her. The load of blood-guiltiness would then be lifted from his own soul, and from Psyche's. Poor innocent Psyche! How much and how vainly had he made her suffer!

So he watched and waited, watched and waited, watched and waited for news from Biskra.

Away over there in the desert, meanwhile, Cyrus Vanrenen, the slave of duty, sat in the best bedroom of the bare little hotel, by the bedside of the unknown sick man from the south, who seemed at intervals delirious and dying. Time after time, reason would apparently return to the patient in a sudden flicker; but time after time, as fast as it flared up, the flicker died out again before Cyrus could make out exactly what it was the stranger so eagerly wished to tell him. For the wanderer's mind seemed sadly terrified and ill at ease: sometimes, Cyrus fancied, he gave one the impression of being haunted by something very like remorse—or might it be only pure panic terror?

All that Cyrus could gather from his rambling talk was merely this: that somebody had been murdered. He recurred over and over again in his delirium to some mangled corpse, which he seemed to behold in his mind's eye, lying unburied on the sand, away beyond Ouargla.

'Cover it up! Bury it!' he cried more than once in an agony of despair, or perhaps of penitence. 'They're coming up from behind! They'll see it and discover us! Just heap the sand above it a little with your hands, so, so! How hot the sand feels! Oh God, how hot. It makes one's hands sting. It burns one as one touches it!'

Cyrus soothed him gently with his cool palm. 'Come here, Corona,' he murmured in an undertone to his sister. 'The poor fellow's delirious! Come you here and look after him! A little eau de Cologne on his forehead, if you can.—There, there, that'll ease him.'

The stranger shrank back in horror at the cry. It was more than delirium. It was the temporary unhinging that often follows a great crisis. 'How it bleeds!' he exclaimed in dismay, looking down at his hands, his eyes all bloodshot. 'How it bleeds as one touches it! How pale, how white! I can hear them coming up even now from behind! Fiends that they are, if they find the body, they'll mangle it and mutilate it!'

Corona drew a tiny bottle from the charms at her *châtelaine*, and poured a few drops of eau de Cologne on her palm with quiet tenderness. Then she pressed it to his head. 'That'll relieve him a bit, I guess,' she whispered, leaning over him. 'One can see, he's terribly anxious in his mind about something.'

'Seems like remorse,' Cyrus suggested in an undertone.

Corona shook her head in charitable doubt. 'More like terror,' she answered with a scrutinising look. 'They must have chased him hard. He ran for his life, and just got off with his bones whole, I reckon. These Arabs must pretty nearly have made a corpse of him.'

At the sound of that word, the mysterious patient, drinking it in greedily, cried out once more in a wild cry of alarm: 'The corpse! The corpse! I must bury it! bury it!'

'He's stronger now,' the white father remarked, in French, as the patient clutched Corona's arm spasmodically. 'He couldn't have clutched like that I'm sure at Ouargla. The quinine's done him good. But ever since we've had him, he's talked this way. He's terribly troubled in spirit about something.'

The patient lay stretched on the bed in a nightshirt supplied by the people at the hotel. His own Arab clothes hung up from a peg behind the bedroom door. A happy thought seized Corona. 'Perhaps his underclothing's marked, Cy,' she suggested hopefully. 'If so, we could see which of the two it is—if it's really either of them.'

Cyrus rose and examined the clothes with anxious care. Not a sign or a mark could be found upon them anywhere. He shook his head with a despondent sigh. 'No good,' he answered, gloomily. 'The man's dying. And he'll die without our ever having been able to identify him.'

The white father understood the action, though not quite the words. '*Inutile, monsieur*,' he put in with a decisive air. 'We searched everything. Not a scrap of writing about him anywhere except the papers detained at Ouargla. *Du reste*, it would be hopeless to expect a name. He could only escape by assuming Islam. Through that fanatic population, so lately roused to a pitch of savage enthusiasm, no confessed Christian could possibly make his way in peace or safety. We wouldn't even venture to penetrate there ourselves. To be suspected of Christianity in such a case is to sign one's death-warrant. A name written in European letters on an article of clothing would suffice to condemn any man to instant massacre.'

'We must give it up then, Corona,' Cyrus exclaimed with a groan. 'We can only describe what he's like to Miss Dumaresq; and he ain't like much except a scarecrow at present. But perhaps she'll be able to say, even so, if it's him. We could get the body photographed, if he dies in the hotel here.'

That evening, in the *salon* of the little inn, a new guest, a big-bearded Englishman, joined the small party of desert travellers. He was a bluff engineer of the rougher type, with much-bronzed face and unpolished manners, who had seen service in South America and Mexico long enough to forget his aboriginal position as an English gentleman. His present business, he told them with the frankness of his kind, was to explore the desert region, with a view to satisfying himself as to the feasibility of the famous Roudaire scheme for flooding a portion of the Saharan depression, and converting the area into an inland sea. He didn't exactly think the thing could be done, but he thought if only you could float your company, there was a jolly good engineering job in it. Like everybody else at Biskra, however, he was deeply interested in the story of the stray refugee from Khartoum, and asked many curious questions of Cyrus as to the man's appearance, state, and chances of recovery. It was seldom indeed that the little forlorn Saharan town had possessed so striking a sensation; and it made the most of it. Biskra gossip lived for the moment on nothing at all but the name and fame of the survivor of the Soudan.

'There were a pair of them at first!' the engineer repeated thoughtfully as Cyrus finished his uncertain tale. 'And they ran away from a caravan on camels! *Two* camels or *one*, I wonder? One of them dead, and one escaped! A curious coincidence. Reminds me exactly of that singular story old Juarez told me when I was over in Mexico!'

'What story?' Cyrus asked, anxious for anything that might cast any light upon the stranger's mysterious history.

'Well, perhaps it ain't quite fair to this man to tell the circumstance,' the engineer answered with a tinge of hesitation. 'It seems like raising suspicion against him without due ground, when, for all I know, he may be all right—as right as ninepence. But it *does* look odd, certainly, this raving about the corpse. Fishy, decidedly. Reminds me to a T of that curious story of poor old Juarez's. Juarez, you know, was a Mexican president: president, they call it, for the sake of the sound: dictator or despot comes nearer the mark: just what the old Greeks we read about at school used to call a tyrant.'

Cyrus nodded a cautious assent, though his personal acquaintance with ancient Hellas was strictly confined to the information contained in Cornell's Universal History for the Use of the Common Schools of the State of Ohio.

'Well,' the engineer continued, stroking his beard with his hand in a contemplative way, 'it was like this, you see. On one occasion, when they were getting up what they call in those parts a revolution—a jolly good riot, we'd call it in Europe—old Juarez had to fly for his life from Mexico City, away across the plain, with a small band of devoted adherents. So he turned

out at dead of night and ran for it like wildfire. They rode on and on across the plain of Mexico, hotly pursued the whole night through by the opposite party, till one by one, the devoted adherents, finding the pursuit a good deal too warm for their sensitive natures, dropped off at a tangent in different directions, and left Juarez at the dawn of day almost unattended. At last, the old blackguard found himself reduced, as luck would have it, to a single companion, almost dead-beat, and with the hue and cry still full pelt after them. He told me the story himself, at Mexico, long afterwards. He was a rare hand at a story, was old Juarez. Well, at the end of his ride, as he was nearing a little mountain fort still held in force by his own party, blessed if his horse didn't give way all at once, and come down a cropper on the plain under him. Juarez, in a dead funk, called out to his friend to halt and save him. The friend halted, like a fool as he was, and took the old reprobate up behind him—two together on the same tired beast, you understand: and on they rode for dear life once more, full pelt to the shelter. Presently Juarez, looking back over his shoulder, saw the enemy were gaining on them fast; and making sure his horse could never reach the gates of the fort, burdened as he was with two riders abreast, he decided like a shot on immediate action. "And what did you do?" said I, when he reached that point, just as I'm telling it to you myself this moment.

"Why, fortunately," said he, "I had the presence of mind to draw my pistol, and shoot the other man dead on the horse before me." His friend, you must recollect, who'd risked his own life to stop and save him. "I'd the presence of mind," says he, "to draw and shoot him."

'My goodness!' Corona cried; 'you don't mean to say he actually killed him!'

'Yes, he did, honour bright, I give you my word,' the bearded engineer responded cheerfully. 'A rare old blackguard, old Juarez was. And, what's more, he boasted of it, too, just as I told you. "I had the presence of mind," he said, "to draw my pistol straight off and shoot him." He thought no more of it than that, I assure you. An episode of his life—that was all—to Juarez.'

At the door of her room, that night, as she went to bed, Corona paused, candle in hand, and looked anxiously at Cyrus. 'Cy,' she said, 'I don't know why, but I wish to goodness that engineer hadn't told us that awful story about the wicked old Mexican.'

'So do I,' Cyrus answered with averted eyes. 'It's—it's made me feel uncomfortable, some, about the man on the bed in the room down yonder.'

'I can't help fancying, myself,' Corona went on, 'that this is the wrong one, and he either killed or deserted the right one, to save his own life, at a critical point, just like the Mexican.'

Cyrus's face grew gloomier still. 'We ain't got any right to judge,' he answered, leniently. 'But suppose it was the right one, though—eh, Coroney?—and he'd either killed or run away from the wrong one? Wouldn't that be worse, almost, in the end for Miss Dumaresq?'

Corona's honest heart recoiled with horror from the bare insinuation of so hideous a solution. Psyche's lover could do no wrong. 'Oh no, Cy,'

she exclaimed loyally. 'It couldn't be that. I'd stake my life on it. I'd bet my bottom dollar against that, any way. If there's anything wrong, it *must* be the other one. Psyche couldn't ever fall in love with a man who could go and do a thing like that, you may be certain.'

FIBROUS PLANTS FOR PAPER-MAKING.

UNHAPPILY, as a progressive people we seem threatened with dire calamity—even scarcity of intellectual food. The rapid strides forward in education of late years, among the lower classes especially; the vast, indeed almost insatiable, demands for periodic literature and cheap newspapers and books; the greater facility for communication by post, and the wonderful growth of manufactures and commerce—all these are causes recently contributing to an enormously extended consumption of paper; while there is no corresponding increase in the supply of the raw materials, which are becoming altogether insufficient, and their cost is greatly enhanced. The evil is a serious one; it cripples the trade, one of the most important in the United Kingdom; and checks the expansion of a most pressing requirement, characteristic of the age, nor, assuredly, will it owe its diminution to any decline in the demand for paper; but as time goes on, and with it development of intelligence and improved capacity for intellectual enjoyment, it must assume larger and still larger proportions.

As is well known, paper in England was at one time made chiefly from linen and cotton rags—a generic term inclusive not merely of rags properly so called, but also of the refuse and sweepings of flax and cotton mills; old ropes and the waste of jute likewise enter into the manufacture of the coloured and coarser sorts of paper. One might imagine there would be ample of each material available, seeing the many tons of raw cotton, jute, flax, and hemp imported and worked up into fabrics. But it must be remembered that in the same rate as manufactories of the kind increase, competition becomes keener; and in order to eke out a profit, their owners find it more and more necessary to look closely to their by-products, many of which, formerly discarded as useless or given over to the paper-manufacturer, are now found to possess a textile value, and constitute the basis of a distinct branch of the trade.

Now, our importation of rags is but a fraction of the materials we have for long consumed for paper. About thirty years ago, when a cotton famine was impending, manufacturers were only too glad to welcome the advent of esparto in the markets, a species of coarse tough grass indigenous to Spain and the north of Africa, which entered speedily into consumption, and to this fibre more than to any other substance we owe the development of the paper trade to the huge proportions it has acquired to-day. But the urgent want for it has been its ruin; the native

cultivators, eager to send the largest possible quantities to market, have recklessly plucked it up roots and all, thus leaving nothing to grow fresh crops; and though it may be raised from seed, it cannot be harvested for twelve or fifteen years after sowing—a system, moreover, unlikely in Spain—and there has been a great falling-off in production, and at no distant date it appears doomed to practical extinction. Though inferior to rags, it answers excellently when used in admixture with them.

Attempts to introduce any new succedaneum in addition to esparto have met with comparatively scant success. Straw from wheat, oats, and rye, has been tried in Britain, the United States, and elsewhere, either alone, or in combination with other materials, on account of its brittleness; but as present treated the yield is small; the price, generally speaking, does not fall very far short of rags; and in England, owing to its further relegation to agricultural purposes and as fodder, it has become hard to obtain, and, in consequence, it is imported in large quantities from Holland and Belgium.

The only other fibre that has seriously threatened to compete with rags and esparto is wood; and since the supply in a raw state is indeed unlimited, much time and trouble have been given to the best methods of preparing it for paper-making. Mechanically prepared, it has little felting property, essential to the formation of a good sheet of paper, and can be used merely as a 'filler-up' in cheap and inferior goods; while the fibre-matter derived by chemical process, though found to be fitted for the finer qualities, and extensively adopted in America, yet is costly; besides, it is only feasible to reduce the wood to pulp in the countries where it is grown.

Even were these substances imported from foreign countries plentiful and cheap, it would be little to our credit to thus furnish ourselves, were our colonies and dependencies equally competent to the task; but under existing circumstances, seeing that foreign sources fail, no choice is left us but to fall back on something nearer home, to some fresh and untried store.

It is futile to think of England herself cultivating fibrous plants for paper-making, even were the climate suitable, the high value of land rendering the idea absurd; and it is to the tropics alone we must look for any reliable supply of new material. There, east and west, these plants abound, in India in particular; its every plant is fibrous more or less, and the stock is inexhaustible; in fact, there is hardly a fibre known that India is incapable of producing. The pre-eminence of the country in regard of this, and the neglect with which the plants have been treated, is almost incredible. Few are objects of European commerce, or are known to the manufacturers, though they are possessed of the greatest strength, and in other cases, of the extreme of fineness, and are admirably adapted

in every respect for textile and such-like uses.

The manufacture of paper from raw indigenous fibre has been practised by the natives of India from very early times, introduced there by the Chinese, who are generally allowed to have been acquainted with the art of paper-making from pulp for a period of at least two thousand years; the introduction causing the natives to largely reject the inner bark of the birch or palm leaves, the slabs of rock, and plates of metal, the objects that they had previously employed in its stead. In India of the present day small local manufactories for it are scattered throughout the country, and although often unbleached, and not adapted to European requirements, yet it is strong and durable, and offers ample evidence of the substances ready to hand, which we might also apply to the growing demands of the home manufacture. Strange to say, though India literally teems with fibre-plants, an Indian paper-making fibre is a question still under discussion. From among the vast array at command for the purpose, selection has occasionally fallen on the lily and aloe-leaved plants, belonging to the genera *Agave*, *Aloe*, *Yucca*, *Sansevieria*, *Bromelia*, and others, all of which abound in excellent white-coloured fibres. Paper was formerly made from the *Sansevieria* in Trichinopoly; and some has been made of the *Agave* in Madras. To cultivate fibre specially for paper has many drawbacks; and as obviating this difficulty, perhaps none is better than from the so-called *Munj* or *Sara* grass, and the *bhakar* grass, both now in use in the Indian paper-mills, as near Lucknow. Large tracts of country are covered with grass jungle, burnt down in the autumn of the year, in order that the young blades may spring up and afford pasturage for cattle; and there seems no reason why this refuse—for at present it is but refuse—should not be saved, by being cut and gathered, before it becomes perfectly dried, and be converted into material for paper. Rice-straw has been suggested as similarly useful, and the supply would be practically unlimited. Various experiments have likewise been made with the bamboo, thus utilised from time immemorial by the Chinese and in Japan; but here the matter of cultivation must needs be reckoned with.

The Sedges, which in appearance nearly resemble the Grasses, but they usually flourish in moist situations, together with the Rushes, might be turned to good account; the family famous, as we are all aware, of having yielded the papyrus of the Egyptians, consisting of thin slices of the vegetable tissue, caused to adhere together under high pressure. But the notion is becoming current that the paper-mulberry tree, more particularly native to China, Japan, Polynesia, and Siam, will yet be cultivated as a hedge-plant in India over the larger portion of the plains, where it is presumed it will thrive to perfection, and that this may be recognised as the Indian paper-fibre of the future.

It would be easy to multiply the names of plants utilised by the natives, and which would in all probability repay the most careful consideration of English manufacturers. Numerous varieties of the Mallow family may be mentioned, all noted for their fibres, of a fine, soft, and

flexible quality. '*Hibiscus cannabinus*,' a small herbaceous shrub with prickly stems, is largely cultivated in the North-west Provinces and the Punjab; in Sind, it is made into nets and ropes; and in the Dacca district, Bengal, and in the Madras presidency, it serves for the manufacture of paper. The edible hibiscus, the 'ochro' of the West Indies and the 'ram-turai' of India, yields a fruit extensively used as a vegetable; and the bark abounds in strong fibre, well worthy the attention of the paper-manufacturer, it being admirable in itself; and the supply would be large; and since the plant is already cultivated as an article of diet, it might be procured at little expense. It also appears excessively easy of separation from the stems.

The same remarks hold good for the fibres of the cotton plants. A leguminous plant, one of the most gigantic and extensive 'climbers' that India possesses, has been also strenuously advocated as a paper-maker, and its abundance and hardy vitality at anyrate sufficiently warrant the idea; it flourishes copiously, throwing its immense arms from tree to tree, until whole forests are bound in almost impenetrable clumps. Nothing will exterminate it; it is frequently cut to the ground because injurious to the trees; but the lapse of a few months suffices to enable it to bid defiance to control, as before. The natives universally convert the fibres into ropes; and of its high merit there can be no difference of opinion.

Like jute, the flax produced in the colder centres of cultivation is beyond the reach of the paper-maker. India, however, grows immense quantities for the sake of the seed, the linseed so called, both for home use and exportation, for the expression of their contained oil; while as a source of fibrous matter the plant is utterly disregarded, because the climate does not admit of the formation of the soft flexible fibre customary in the market, but only of short fibres, which, however, would answer capitally for paper, and with little outlay.

But among cultivated plants there is one that, taking all in all, would perhaps prove superior to any other—the Plantain or Banana; and against it, as against so many, the objection could not be raised that its growth is remote from the sea—thus doing away with freight charges—for, as every one acquainted with tropical countries knows, it is reared everywhere for its fruit. It is a prime necessity of life in the tropics. The poorest and meanest, even though he have no other possession, invariably has his plantain in front of his hovel, and similarly it has found space in the most splendid gardens. The farinaceous portions of the fruit contain all the nutritious properties of meal; and in many regions it acts in place of bread. The clusters weigh from thirty to eighty pounds; and immediately after they are gathered, the stems are cut down and allowed to rot on the ground; and from each stock six to eight young stems spring up and become large and fruitful; and by this method, successive relays of this food in a fresh state can be had nearly the whole year round. Millions of stems are thus thrown away annually; absolutely no use is made of them by the natives, even for manure or burning; and the fruit already pays the expenses of the culture. Each plant would

yield from three to four pounds of fibre, or about nine thousand pounds per acre, well adapted to the paper-maker. The supply would be always certain; and from the nature of the stem, consisting almost entirely of water and of fibre, the separation of the latter would be readily accomplished. A difficulty lies in the fact that as present cultivated the stems would have to be collected over wide areas. Whether extension of cultivation would pay is questionable. This would at the same time increase the food of the world to an indefinite extent, impossible to be consumed on the spot. But this is immaterial, since the fruit contains a large quantity of saccharine matter, and may be preserved as figs. In this state, kept even for thirty years, it is said to remain palatable. The fibre, however, it appears, is largest in quantity and finest in quality previous to the ripening of the fruit; but exclusive cultivation for paper, with frequent cropping, would, it is feared, lead to disaster.

In competing with rags in the market, fibrous plants labour under one great disadvantage. The former are already far advanced on their road towards fabrication of paper; whereas in the case of an herbaceous substance newly appropriated, additional expense must be incurred in cleansing and otherwise bringing it into a condition corresponding to ordinary rags. Thus the benefit arising from seeking a new fibre, being the refuse of some previous industry, so that the cost of production may have been already partially or wholly defrayed.

The bulk, and consequent high charge for transport here, are also items that cannot be forgotten in the introduction of these Indian fibres. But surely this obstacle might be in great part removed were the early stages of manufacture carried out in India itself, the raw fibres being reduced there by some cheap and ready mode to a state of crude pulp; and thus, when dried, in convenient portable form be shipped for home; and, arrived here, it would be quickly changed, by our superior methods and machinery, into the finished product. In India every facility for this rough preliminary preparation appears to exist, the labour being exceedingly low-priced, and the workmen intelligent and ingenious; and the actual process might be easily effected with aid of the 'Dhenkee,' a simple instrument found in almost every house, in principle much like the European tilt-hammer, and employed for husking rice and a variety of other every-day domestic purposes.

Failing successful trial of these fibres in the English markets, it seems incumbent upon us to foster by every means in our power their use in the interest of India herself. There is no doubt at all we have destroyed the native manufactures by competition, and we owe something by way of compensation. The Indian paper-mills should be qualified to meet their own markets, and not only this, but to aim at lessening not merely the government but the commercial imports of European-made papers. There is good reason to believe that nothing will tend more to ensure permanent tranquillity and prosperity among the people than a sufficiency of remunerative industrial employment, the higher classes deriving the resulting revenues. Would statesmen give their attention to this important subject, the conversion

of the vast variety of fibrous matters—without assignable limit, it may be said, now permitted almost entirely to run to waste—into valuable materials for manufacture, would present itself among the first to promote their wishes.

A NOBLE REVENGE.

PART II.—SO NEAR, AND YET SO FAR.

In a meadow on a cliff, at a favourite sea-side resort, the pupils of Dr Calthorpe's school were playing cricket one fine Saturday afternoon. Full of life-energy and the inexhaustible spirits of boyhood, without a second thought in the world, they were heart and soul in the game; while two ushers on duty performed a quarter-deck walk in the shade of a hedge that bounded the field on the roadway side, seizing the opportunity to study a favourite author, but keeping wary eyes and ears open on their youthful charges at the same time. The school was situated at the outskirts of the town, a large handsome building, nicknamed 'the House of Lords,' in consequence of the many sprigs of nobility the Doctor prepared for Eton.

As the locality was retired, with a charming view over a sapphire sea, it was the custom for ladies, nursemaids, children, and a few stray boatmen, to stroll on the cliff when the Saturday afternoons were fine, to see the play, and how very much like other boys young earls ran and enjoyed themselves. Several little ragged plebeians hung on the five-barred gates to shout and applaud, only too well pleased if a strongly hit ball chanced to come outside the field, that they might have a run for it, and in a humble degree be participants in the game so dear to the hearts of English boys both gentle and simple.

Leaning on the top bar of a gate was a person who seemed to be deeply absorbed in watching these youngsters. He was a tall thin man with a dark sunburnt face and gray hair—gray, not from age, for on close inspection he was not old. His features were well cut; but, either from ill-health or care, he seemed to have prematurely withered. His dress was neat, but faded, in fashion far from modern. One boy he had singled out from the others, no doubt on account of his beauty—a bright sparkling lad, who flew hither and thither with the speed and grace of a young Mercury; a face rosy with health; full blue eyes, and hair shining like pale gold in the sunshine. Presently, a ball came flying over the gate; the spectator caught it; and the young lad just described followed, running. 'Come, I say, just throw it, will you?' he called out; for the man, instead of sending it back, retained the ball in his hand. But he neither threw it nor answered the young Antioch who came panting to the gate. Giving the ball with one hand, he laid the other with a retaining grasp on the boy's shoulder.

'Am I wrong in supposing you Mr Desborough's grandson, Felix Gravenor?'

'You're right and you're wrong. I am Mr Desborough's grandson; but my name is Graves.'

'Ah!' exclaimed the man, suddenly removing his hand as if stung.

The boy ran back to his game.

One of the ushers, a little man with spectacles,

was near, and heard the words. 'You appear interested in that boy,' he observed.

'I knew his father,' said the other sadly.

'Ah! he died long ago—before the boy was born, I am told.'

'Alas, yes.'

The usher looked at him curiously, for there was a true tone of regret in his voice.

'He is a fine lad,' resumed the man, his eyes still following Felix, who was once more in the game. 'Tell me—that is, if you will—is he promising—clever?'

'He has good abilities, and learns without much trouble. Whether he will retain knowledge or not, I cannot say. He is the only child of a devoted mother, and his grandfather spoils him.—Here comes Mrs Graves,' continued he, pointing to an open carriage approaching along the white dusty road. 'She is staying down here for a few days.'

The man withdrew to a little distance, taking his stand behind two boatmen, and the interest with which he had watched the boy was now transferred to the mother. The carriage drew up at the gate, whence the lady could have a good view of the field without alighting. Little Mr Barrett knew her, and raising his trencher, advanced to within speaking distance.

At three-and-thirty, Lena looked quite a young woman, who had perhaps been prettier in youth, but was still attractive on account of her fine complexion. Since that dreadful wave of shame and sorrow had passed over her, she had lived under her father's roof, returned to the sharp tongues and cruel stabs of her sisters. But she had suffered so much that they seemed only like wasp-stings compared with her severe wound, that had not yet healed. Lena had never doubted her husband, but dared not say so, taking refuge in silence. When his name was suddenly mentioned by her sisters and father, it had the effect of an electric shock first, then made her tremble. All her happiness now was centred in her boy, who, as he grew in stature, also grew in his grandfather's affections. The one happiness in Lena's life was to go occasionally to stay for a few days near Dr Calthorpe's school, as she was doing now.

Mr Barrett was quite prepared for the habitual questions she put to him: Was Felix's appetite good? Did he sleep well? Was he attentive in his studies? And how about his arithmetic, for which his grandfather was especially anxious? All these questions were answered satisfactorily, excepting the last. Arithmetic was by no means one of his strong points.

During this dialogue at the gate, one of the boatmen, who, at a little distance on a rising ground, watched the players, was startled by a peculiar sound, like a sob, behind him. He turned, to see a face close to him so convulsed with anguish that he exclaimed: 'You are ill, sir. Lean on me. There's a seat ahead; let me pilot you to it.' Rough sailor though he was, he led him gently to a bench that was placed to command a view of the open sea. He removed his hat, and noticed that the stranger was shaking as if with an ague.

'Thanks. It was a sudden faintness. I'—

'Cast anchor here for half an hour; the breeze will soon bring you to.'

But the wanderer sat there much longer, as if

regardless of time, gazing out straight before him with eyes that saw nothing. When the day waned and the rising moon threw a silvery wake on the rippled waves, he rose and descended to the town. In passing Dr Calthorpe's house, he rung the bell, asking the porter if he would oblige him with the name of the hotel at which Mrs Graves put up. It was given. He then made his way to the railway station, and thence back to London.

That same evening Mrs Gravenor sat at the open window of a small family hotel overlooking the sea. She had no lights in the room, for she loved to meditate in the twilight; gazing over the vast expanse of water soothed her. There was the distant sound of a band playing on the esplanade, and a few promenaders were returning as the moon rose higher. Glancing downward, she observed a solitary figure approaching from the opposite direction, whose outline was clearly defined against the background of luminous waves. The man's outline, his easy swinging gait, first made her heart stand still, then beat violently. This person walked slowly, and on passing the house, glanced up at its windows. She of course was invisible; but there was sufficient light for her to discern his cast of features.—It was her husband!

She tried to call 'George!' but no sound issued from her lips. For an instant she sunk upon a couch, then springing up, hastened to an adjoining room, hastily donned a hat and mantle, then flew wildly from the house in the direction he appeared to be taking. She ran along the esplanade, but failed to overtake him, for he had turned down a neighbouring street. She retraced her footsteps, agitated, but with a feeling of ineffable joy pervading her whole being. He had returned! She knelt down with prayers of thankfulness. What signified now the eleven long sad years she had endured? He lived. They should meet again!

An express train brought an unexpected and unwelcome visitor the following day from London, Mr Thorel. His father had been a Swiss, and married the eldest sister of the late Mrs Desborough. Although Lena's cousin, she had never seen him until he came from Geneva to take the management of the foreign department at the bank, for which he was well qualified. He became naturalised, and intended to become a partner of the house some day, and to marry Lena, with whom he fell in love at once. In age he was better suited to the eldest Miss Desborough, who would not have objected to become Mrs Thorel. Lena, however, thoroughly disliked him. When he spoke to her, elongating his thin lips and showing his white pointed teeth—which all stood apart—in what he imagined to be a smile, to which his eyes did not correspond, she shrank from him. When he took her hand in his moist one, she shuddered. Yet Mr Thorel was considered good-looking. He was a black-haired man, with a pale face, on which a gleam of red never appeared. His features were good, but his eyes were too small. Below the middle height, with an erect figure and broad shoulders. Such in appearance was Mr Thorel. In early days he had proposed to Lena; but although favoured by her father, she gave him a decided refusal.

'You were too premature,' observed Mr Desborough. 'Wait until she knows you better.'

The more Lena saw of him, the less she liked him. His continued assiduous attentions, in spite of her rejection of his suit, offended her. Then Captain Gravenor, the handsome frank officer, appeared, and Thorel lost her.

During the years following the Captain's disgrace, no news coming of him, Thorel's hopes began to revive. 'If he is dead, I will have her yet,' said he.

At length he was admitted as a junior partner in the banking-house; then he took a fine house, and drove to Nicholas Lane in a mail Phaeton, living in far greater style than Mr Desborough himself. Such was Mr Thorel at five-and-forty.

Mrs Gravenor was surprised when his name was announced; however, she received him. As she entered the room, he scarcely knew her. Could this bright-eyed woman be the melancholy resigned Lena? What a mighty magician is happiness! Since last night, renewed hope had changed her expression, renewing her early beauty. She even smiled when they met—she was in harmony with all the world.

Mr Thorel wondered, but naturally set down the change to the sea-air. Although smiled upon, he looked serious.

'Lena,' said he, 'I am sorry to be the bearer of bad news. Your father has had another of his attacks. Dr James pronounces it serious. Your sisters sent me for you.'

'I am grieved, but scarcely surprised. I have thought him looking too flushed for some time. I will come; but I must first say good-bye to my boy.'

'That will take time,' observed Mr Thorel. 'Is the farewell necessary?' He looked angry, being in fact jealous of the love she bestowed on Felix.

'Indeed it is,' said she. 'You must amuse yourself with luncheon while I am gone.'

On passing through the hall, the servant was sorting letters he had just received from the postman for the hotel visitors. 'Two for you, ma'am,' said he, handing them to her.

Entering a fly, and flurried by the hasty news, Lena held the letters mechanically in her hand for some minutes before she looked at them. Why, whose writing was this? With tears streaming from her eyes, she kissed the superscription again and again. It was from her husband. She then tore it open; but her agitation prevented her reading the contents; the characters danced before her eyes. Struggling to master her emotion, instead of alighting at Dr Calthorpe's house, she drove on to a little distance, where a narrow slanting path led to the beach. Here, on a seat in a quiet nook, she read the precious lines. It was not a long letter; but the contents written under such circumstances are too sacred for transcription. It concluded by bidding her to have faith in him, and wait. He intended devoting himself to the endeavour of discovering the mystery of the forged cheque. If his innocence were proved, he would claim her before the eyes of the whole world.

Felix was distressed to see traces of tears in his mother's eyes; he thought them tears on account of his grandfather's illness, as did Mr Thorel, when Mrs Gravenor rejoined him; but

they came from another source than that of grief—they were those of thankfulness.

Mr Desborough was a *bon-vivant*. For some time past he had been advised to relinquish his favourite wines, which he was reluctant to do; the result was he became subject to slight attacks of apoplexy. This last one was more serious, and alarmed his family. But he did not die, as was anticipated. He was obliged to change his diet; and in time the doctors brought him round. But for several months he was unable to continue his accustomed attendance in Nicholas Lane, the management of the bank being intrusted to Mr Thorel in the interim.

THE GIRAFFE AT HOME.

By H. A. BRYDEN.

Of all that wonderful profusion of game with which the continent of Africa has been so richly endowed, the Giraffe is perhaps the most singular, certainly one of the most beautiful. Sharing with the zebra, and its extinct cousin the true quagga, the gnu, and the hippopotamus, the distinction of being peculiar to Africa and to no other country, its towering form, extraordinary shape, and rich colouring, point to it, even among the zoological marvels of the Dark Continent, as one of Nature's rarest and most singular efforts. Even in the days, now becoming remote, when this great game was to be found close to the Orange River, its shy habits, and the parched nature of the country inhabited, rendered it always a prime reward for the hunter's skill and labour. At the present time, the giraffe-hunter must wander far afield indeed before he may hope to set eyes upon this stately quarry. Ever since youth, one of the writer's most cherished ambitions had been to see the tall giraffe in its native haunts. Last year this longing was happily gratified; and in the distant thirstlands of the North Kalahari, and amid the waterless mimosa forests fringing the southern border of the Botletli River, in the region of Lake Ngami, several troops of these long-sought animals were seen, and specimens brought to bag.

To have witnessed these beautiful quadrupeds browsing quietly in their desert haunts; to have witnessed their swift and extraordinary paces when pursued; and, after the fastest gallop that an African hunting-horse can compass, to have at length laid low that colossal form—these are rewards surely sweet and ample enough to repay the many weeks of toil and trouble that have been expended in reaching those remote hunting-grounds.

It has been asserted by naturalists, with some show of reason, that the giraffe was never to be found south of the Orange River. There is certainly no actual and direct evidence that even in ages past it browsed within the confines of the present Cape Colony; but this may probably be put down as a moot if interesting point, never now likely to be decided.

In the quaint old-fashioned travels of Paterson, Le Vaillant, and Campbell—*circa* 1777, 1784, and 1813 respectively—it is undoubtedly shown that giraffes were shot very close to the north bank of the Orange; and there seems no real reason, other than the known peculiarities of geographical

distribution, why this animal should not have wandered farther southward. In support of this latter hypothesis may be adduced an old Hottentot tradition to the effect that the giraffe was anciently found in the Amaebi thorn-country, in the present Queen's Town district of Cape Colony. There are, too, to be seen to this day in the Bushman caves near Graaff Reinet and other portions of the Eastern Province of the Cape, rude but unmistakable likenesses of this animal, which may or may not be considered evidence in favour of the contention that the giraffe did once make its habitat south of the Orange River.

Five or six decades since, the giraffe might have been found in many parts of Great Namaqualand, and in the country of the southern Bechuanas. In the Kalahari Desert, between these countries, it was extremely plentiful. In 1837, Captain Cornwallis Harris met with it in the present Transvaal territory; and in considerable abundance near the junction of the Marico and Limpopo rivers. Even till within the last few years it has lingered in the unhealthy low country lying upon the eastern border of the Transvaal. But year by year it has been hunted from one sanctuary to another, until now the giraffe must be sought in the far corners of Khama's Country, or in the waterless recesses of the North Kalahari, before it can be chanced upon. Even, then, its habits are so shy, and its love of extreme solitude so constant, that great precautions have to be taken, and the most skilful of Bushmen hunters employed to track the beautiful giant to its forest fastnesses.

The giraffe, for at least three parts of the year—that is, during the spring and winter months in Africa—seems to be perfectly independent of water. I have taken great pains to get at the truth of this matter; and all hunters, native and European—including of course Boer hunters—that I have met confirm this fact. It is certain that the only giraffes found by myself and my hunting companion were standing in perfectly waterless bush, far remote from water; and it is equally certain that during that season (the winter) they never attempted to drink in the Botletli River, their only possible source of supply. This faculty of going for months without water the giraffe seems to share in common with certain of the South African antelopes, notably the eland, gemsbok, and hartebeest among the larger antelopes; and the steinbok, duyker, and springbok among the smaller. The food of the giraffe consists almost exclusively of the leaves of the giraffe acacia (*Acacia giraffæ*), known throughout the interior as the 'Kameel-doorn' or 'Camel-thorn.' The Boers know the giraffe only by their Dutch name of 'Kameel;' and English hunters and traders invariably term it 'Camel'—a sufficient explanation of the name of its favourite tree. There are few more beautiful sights in nature than the spectacle of the giraffe, its tall neck upstretched, plucking with long prehensile tongue at the sweet young leafage of the acacia. In August of last year, the writer had the great good fortune to surprise a troop of nineteen, all feeding busily in this manner, fifteen being gathered round one tree. It was a sight never to be forgotten.

Although familiar to the Romans in the days of the Empire, when camelopards—doubtless from

North Africa—were exhibited in the arena, this animal seems in later times to have become completely unknown to Europe. There is indeed vague mention of an animal resembling the giraffe shown at Venice some three hundred years back; but until the close of the last century, it seems to have been classed more among the creatures of chimera or fable than as anything belonging to earth. Colonel Gordon, an officer serving under the Batavian Government at the Cape, appears to have been the first to dispel this illusion, and in about the year 1777, in company with Lieutenant Paterson, a British officer, he shot a giraffe just across the Orange River. A quaint portrait of this specimen is given in Paterson's book of Travels, published a little later. Le Vaillant, the French naturalist, to his own incredible joy slew another giraffe about the year 1784; and some of the most ecstatic portions of his amusing if highly-coloured narrative are devoted to the chase and death of this specimen, as well as to an analysis of the traveller's own over-wrought feelings upon such an unparalleled event. In Le Vaillant's Travels also, a figure of the giraffe is given. Even at the present day it is difficult to convey an adequate idea of this quadruped. From the scarcity of its occurrence and the singularity of its gait when roused, no animal in the wild state is so difficult to depict. A dead specimen is not easy to draw, even if the hunter—as very seldom happens—is a draughtsman; while the skin is so thick and of such enormous weight as to require cutting in half and disposing on two pack-oxen to be brought into camp.

On three succeeding occasions last year, as I had a camera with me, I employed Masarwa Bushmen to carry my photographic implements for me, in hopes of 'taking' a dead specimen. On these occasions, after long hot days of severe toil, no giraffes were sighted. Needless to say, during the next hunt, when the camera was left behind, a big troop was found, of which four mighty camelopards were laid low.

It is true there are specimens of the giraffe in the gardens of the Zoological Society in Regent's Park, but these pallid and undeveloped captives do not fairly represent the mature specimens of wild Africa. The colour of an old bull giraffe is of the richest dark orange chestnut, deepening almost to black upon the back. Old cows in the same way darken very much with age. The younger and mature members of the troop present the most beautiful array of colouring, varying from a rich ruddy orange to a bright lemon fawn.

It is a thousand pities that the authorities at the Natural History Museum do not procure good representative specimens of the giraffe while yet they can be obtained. Within the last few years, wonderful strides have been made in the stuffing and setting-up of skins; and the specimens of rare game sent home recently by the great hunter Mr F. C. Selous now afford faithful representations of the living animals, instead of, as in the case of many of the older specimens, absurd and hideous caricatures. The only stuffed giraffe in the collection of the Natural History Museum is certainly of great size; but it is wretchedly set up, and gives no sort of idea of the animal in its natural state. This specimen is very old and worn, and was shot, I believe, during the

expedition of Dr Andrew Smith about the year 1835. Similarly, at the Cape Town Museum the solitary example is little better than a misshapen monstrosity, and the skin is in a wretched condition. When it is remembered that this very skin lay for three years upon the open beach at Walfisch Bay before it was sent to Cape Town and set up, some idea may be formed of its miserable plight. But the Cape Government is not renowned for its anxiety to further the interests of science and natural history, and hard working and zealous as are the Museum authorities, the establishment is in a pecuniary sense very ill supported.

The most beautiful point about the giraffe is the eye, which is large, dark, full, and of the most melting tenderness, and shaded by long lashes. The eyes of the most beautiful gazelle cannot hope to surpass the bewitching softness of the timid giraffe's. Dependent as this animal is, from its sheer defencelessness, for its safety upon its scent and vision, these senses are extraordinarily acute; and the eye is so formed and set in the head that the animal has, without moving, a wide field of vision both in front and rear.

The pace of this animal is singularly deceptive. When the hunter first sets eyes on it as it moves away, he thinks it is merely going slowly at a curious gliding walk, and can be quickly overtaken. He canters slowly, and is surprised to find he is still losing ground. Even at a hard gallop it takes a good South African horse to run up to a giraffe; and unless a tremendous dash is made during the first mile of chase, forcing your horse at top speed with spur and sjambok, the tall quarry is as likely as not to get clean away from you. When pressed, the gait is most extraordinary. The giraffe progresses by moving two legs on one side simultaneously, and when forced to its greatest speed, its action resembles a series of striding leaps in which the hindlegs are kept very wide apart. As it runs thus, the great neck swings up and down, and the long black tail switches with the regularity of clockwork. Its limping, pitching action can only be compared to a gigantic and awkward automaton, or to the motion of a great ship pitching on a troubled sea. Nothing can be more wonderful or more exciting than to have a large troop of this most beautiful and stupendous game thus rocking and swaying in front of one.

As a rule, the giraffe is found in open bushy forest, and when pursued, it invariably runs for the most thorny and entangling portion. Its own thick hide and great weight enables it easily to force a way through the densest obstacles, which tear the rider and his horse terribly. It is not only advisable, it is a necessity to wear a stout thick cord coat when hunting these animals in forest-country. Nothing is more remarkable than the way in which these tall creatures duck and evade the branches of trees. The long neck is bent and the beautiful head lowered, so that branches which all but graze the withers are passed; and the operation is performed with great rapidity. In the same manner trees and bushes are avoided with sudden and astounding ease, the great creatures sheering and tacking in thick forest in a perfectly bewildering way. Curious though it may seem, the giraffe is ex-

tremely hard to find in forest-country, even although a troop may be feeding with their heads above bushes and low trees within the vision of the hunter. The long neck has a strange resemblance to the trunks and limbs of dead trees, and the colouring of the animal assimilates very wonderfully, especially in winter, with the sun-scorched vegetation, the yellow glare around, and the play of light and shade through foliage. Every distant tree or limb is therefore most anxiously scanned when giraffes are known to be in the neighbourhood.

The flesh of young giraffes and of fat cows especially is excellent; there is the least musky flavour perhaps, but it is not unpleasant. The tongue and marrow-bones are great delicacies, the latter, particularly, furnishing the rarest and most delicious banquet of the African hunter.

Few beasts of the chase are more poorly endowed with means of defence; but even the mild giraffe when wounded and brought to a stand, will, if the hunter approaches from the front, chop at him with its forefeet, and a blow from such a limb is an exceedingly dangerous one. I have questioned many hunters on this point, and cannot ascertain that the giraffe uses its legs in any other system of defence.

At the present time, the giraffe is mainly sought after for the value of its hide, which, even so far up country as Khama's Town (Palachwe), now commands a value of from two pounds ten shillings to four pounds ten shillings a skin, varying according to age and sex. The hide of a tough thick-skinned old bull, from an inch to an inch and a quarter in thickness, is of course the most sought after. When one of these great creatures lies prone upon the veldt, it seems as if enveloped in a mantle of brass, and the fingers can make no impression whatever upon the carcase. Not many years since, the hides of the rhinoceros and hippopotamus furnished ox-whips and riding-whips—colonially known as *sjamboks*—all over South Africa. But the rhinoceros is all but exterminated south of the Zambesi; the hippopotamus becomes scarcer year by year; and the hide of the giraffe is consequently in greatly increased demand. A few years back, there happened a dearth of sjambok hide, the price of whips rose immensely, and a giraffe skin sold readily for five pounds and more. Forthwith, parties of Dutch and native hunters flocked into the Kalahari, and scores upon scores of giraffe were slaughtered. On coming out with their loads, the hunters discovered that they had overstocked the market, and that prices had rapidly fallen again. Most up-country natives, especially the Bechuanas, use the hide of the giraffe for making the neat sandals they habitually wear, preferring it for its strength and toughness to any other. It seems a pity that for the sake only of whips and sandals, and to furnish the hunter with meat and an exciting form of sport, this stately creature should be exterminated from South Central Africa, as it bids fair soon to be.

It is a difficult matter to restrain one's sporting instincts, and to content one's self with merely looking on at such extraordinary creations of animal life. Upon a first and even second occasion, it is, I will admit, from personal experience, a physical impossibility to repress one's natural

hunting instincts—instincts deeply implanted during long ages—in a moment of such supreme excitement. But having fairly tasted the delights of giraffe-hunting, and they are very keen, I would never again, if I could help it, lay low another of these creatures, except to furnish a supply of absolutely necessary meat.

Its speed and staying powers and the nature of its habitat will always render the giraffe well worthy of the sportsman's skill; but in these days, when game is vanishing, almost as if by magic, from the face of the earth, unless its flesh is actually and imperatively needed, this, the most rare and characteristic of the African fauna, should, in my judgment, be suffered to go unmolested.

The North Kalahari will not for long retain its waterless renown; already concession hunters are everywhere securing 'veldt'; water will sooner or later be found in places hitherto considered to be lacking; and one of the last southern strongholds of the giraffe will then be gone.

Khama, who owns or controls a very large proportion of the best giraffe country now left to South Africa, might be induced to protect these rare and harmless animals. Already he only allows his own people or his own friends to shoot them, and a chief of such intelligence and such power could do very much towards staying extermination in his vast territory. But, on the other hand, after Khama, the deluge—otherwise extermination—is, I am afraid, pretty sure to come. The British South Africa Company, which it is said intends to preserve game, may, however, do something in the countries under its control.

Roughly speaking, the present geographical distribution of the giraffe may be said to extend from Khama's country—Bamangwato, North Bechuanaland—in the south, to the southern Soudan in the north; and in dry, suitable localities, where the giraffe acacia is to be found, its range extends all over Africa between these limits. Utter extinction is for the present, therefore, happily not immediately assured. But as Africa becomes opened up year by year—almost month by month—these beautiful and defenceless animals must surely pass away. At the end of another century, our successors will probably, as they gaze at pictures of the extinct camelopard, marvel that so extraordinary a creature could have lingered so late into the world's history. Yet another hundred years and their successors will be inclined to rank the giraffe among dragons, unicorns, and other creations of fable.

CHIT-CHAT ABOUT EYES.

AMONG the five different organs by means of which alone we are enabled to perceive the various phenomena of the external world, there is none of so great importance to us as the Eye. There is no sense we make use of to such an extent, or is so often necessary to supplement and render sure the action of the other four, as that of sight. To direct our sense of touch, to aid our localisation of sound, and in many ways to help our appreciation of smell and taste, the eyes are invaluable to us. Since,

then, we make more use of this sense than of the others, we surely ought to know in proportion more about the organs through which the sensation of light is produced than of those through which the other senses do their work. But beyond the elementary facts, the study of the eye is complicated, and needs much time and patience—far more, indeed, than hundreds of busy men and women can afford to devote to it. However, as we are all possessors of the articles in question, it may not be uninteresting to call to mind a few facts about the eyes—curious, obvious, inexplicable, and true.

Purkinje discovered a very simple and highly entertaining experiment by means of which the *retina*, with all its veins and blood-vessels standing out in relief against it, can be thrown into the air before one's eyes. It is called the Arborescent Figure, from its likeness to a many-branched tree, and is produced in the following manner. In a dark room at night move a lighted candle backwards and forwards before the eyes—these being firmly fixed on the wall beyond. After a few seconds the air will assume a reddish appearance, and running over it in all directions may be seen the veins and blood-vessels in bold relief; while towards the centre of the figure there rises up a dark trunk, from which the veins branch out on all sides. The trunk is visible where the optic nerve enters the eye; and this experiment is chiefly interesting to the student as proving that the parts of the retina which actually receive and produce the sensation of light must lie behind the blood-vessels, since these cast their shadow on to it, and we are enabled to see them, as we see any other object—externally.

It is remarkable, also, that although the optic nerve is of all parts of the eye the most sensitive to light, yet, should an object fall on it as we look round us—and some object must always be thrown on it—it is invisible to us; and in our field of vision there is in reality a gap, though in ordinary sight the surrounding edges of this gap draw up together, and so fill it. But by closing one eye, by practice one may actually force the object which is reflected on to the optic nerve to disappear completely from the field of vision. Bernstein—whose work on *The Five Senses of Man* is full of interest from cover to cover—tells us that even the sun itself can be made to disappear if it fall exactly on the blind spot where the optic nerve enters the eye. This may account for the fact that some people can close one eye and stare the summer sun in the face without wincing.

Towards nightfall, as the light grows scarce and dim, the pupil of the eye increases to its greatest size so as to catch and absorb all the rays it possibly can. Thus, a cat's eye will grow large at dusk; and those of the night-loving owl are so made as to produce a greater convergence of the rays of light, so that in faint light it can distinguish objects closer. It is as great

a mistake to suppose that cats can see in the dark, where *no* light is, as it is to suppose that under the influence of passion or excitement man's eyes have the power of emitting light. It is impossible, as has been proved beyond a doubt by many experiments in utter darkness. True, a cat's eyes have a wonderful brilliancy; but this is due to a 'carpet of glittering fibres' called the tapetum. It may be to some extent in virtue of this glitter that they possess their alleged power of fascinating small birds and other creatures, though we certainly need not suppose that the terror and inability to move evinced by the victim are due to the power of the eye alone. Fear of the approaching monster, which instinct tells them is hostile to their life, is fully as paralyzing as any eye glitter.

Kalm mentions having seen a rattlesnake 'lying at the bottom of a tree on which a squirrel was seated, fixing its eyes on the little animal, which from that moment cannot move or escape, but begins a doleful outcry; comes towards the snake; runs a little bit away; comes nearer, and finally is swallowed.' But, as if to show that this result of bewilderment is not all to be put down to the eye alone, Dr Andrew Smith says: 'I have heard of cases in which antelopes and other quadrupeds have been so bewildered by the sudden appearance of crocodiles, by the grimaces and contortions they practised, as to be unable to fly or move from the spot towards which the crocodiles were approaching to seize them.'

This power is in the human animal often developed to a very great extent, and the part that the eye plays in fascinating a fellow-creature by mesmerism—thus opening the way to almost infinite psychical results and unveiling unknown depths of possibility—is decidedly great in proportion to the magnetic force of the system, or rather the mind, for which it acts.

The meaning of the evil-eye, the 'Ophthalmos baskanos' of the Greeks, the 'fascinare' of the Romans, was probably far more than a vulgar superstition. We find traces of it in almost every country, notably to this day among the canny Scots who inhabit the Western Isles of the sea, of 'Ulva dark and Colonsay,' of Skye and the Hebrides; and of the Turks, who distrust the evil-eye of the stranger. But in old classical days the power seems chiefly to have been used for the purpose of grievously afflicting the livestock of disagreeable neighbours. So we find to this day in Ireland, parts of Scotland, and the west of England, where this belief is still prevalent. Certainly, in some form or other, mesmeric fascination by the eye has always been known; but that any one person, with no matter how evil an eye, should be able to 'teneros fascinare agnos' to any extent or number is ridiculous, and not seriously to be entertained for a moment.

But before we leave the human eye to notice one or two peculiarities in the eyes of insects and other creatures, we must not forget several other facts, which show us how very easily the senses may conjointly subject us to the most complete and perfect hallucinations. For instance, we can

'perceive' light without the smallest aid from the retina. If the optic nerve is sufficiently excited to reach the sensorium and create a disturbance at that centre of the brain where the optic nerve terminates, we shall then see light and sparks. If, moreover, the optic nerve is cut or mutilated in any way we should see a brilliant flash of light, though without any sensation of pain. And so it is with the other nerves: the auditory nerve has only to be excited, not necessarily by sound, so as to reach its centre the brain, and we shall hear a sound. How many ghosts might not be destroyed in this way?

Another curious fact about the eye as regards its perception of colour is, that, according to Bernstein, one in twenty persons are afflicted with red-blindness. In the normal eye the edges of the retina are not sensitive to the sensation of red light—that is, cannot *see* red colour. In some eyes this peculiarity will extend itself to half the extent of the retina; and in very many others (to no less, indeed, than one in twenty) this spreads over the whole of the retina. The possessors of such eyes will confuse in the most curious manner dark green and yellow with red. This is not always apparent; but a few tests will surely bring it out, and we should be amazed to find how many of us are subject to this partial colour-blindness.

All the muscles of the eyes are so arranged as to enable us to bring both eyes to bear on the same object at once. If we wish to look to the right, an exterior muscle sets the right eye in motion; but an interior, the left. Thus, we can look inward at the tip of the nose, but not outwards, one eye to the left, the other to the right; or one eye up, the other down.

The eyes of insects present several peculiarities. Often in the same individual we shall find two sets of eyes, the simple and the compound; these latter having a large number of minute hexagonal facets, each of which is in reality a cornea; and the marvel is that every single facet belongs to a distinct eye with pupil, iris, lens, all complete. The number of these corneas varies very considerably. While the ant possesses fifty only, the ordinary house-fly has four thousand; butterflies have no fewer than seventeen thousand; and some beetles rejoice in as many as twenty-five thousand.

The fish has also one striking though obvious peculiarity: its pupils are large, to absorb all the light they can; but the eyes are provided with no lachrymal apparatus, Father Ocean himself being so assiduous in performing for them the washing process that tears are not necessary.

The conditions of light naturally affect the eyes of animals considerably; and in the Mammoth Caves of Kentucky and in those of Adelsberg the creatures have been found blind or in various stages of blindness.

There are many insects which have a very much larger field of vision than we have. This is due to the greater concavity of their eyes, enabling them to see round the corner, so to speak, behind, and at the sides. This development in man would have its objectionable points, but also its good ones, not the least of which might be the detection of pickpockets.

The writer was once in the isle of Skye, being driven along a lonely road in a one-horse cart. Suddenly the animal began to shy violently towards one side of the road, though there was nothing in sight that could possibly have frightened it, both sides of the road being flat moorland for miles. However, nothing could induce the creature to move forwards until the driver eventually got down and led him past the objectionable thing, whatever it was. As he again took his seat on the box, he shook his head and said mysteriously: 'Ah! he'll be seeing something that we cannot see! A man was murdered here two years ago on this very spot.'

But this is no occasion for discussing the question whether animals in general, and horses in particular, have abnormal powers of vision which enable them to see the immaterial. Anyhow, the formation of their eyes in no way warrants any such supposition; and probably, if there is anything in the stories, the keen sensitiveness and heightened instinct of the animals played no little part in the occurrences.

To return for the last time to the human eye. An interesting point is the cause of the different shades of colour we see in them. On a certain membrane in the interior are numerous cells, called 'pigment' cells. When these are present in very great numbers they produce that deep black colour of some eyes, and in proportion to their numbers, decrease also the depth of colour, till finally a light blue is reached. In certain eyes these pigment cells do not exist at all, being wanting, indeed, all through the system, hair and skin. A person of this description is called an albino, and among animals we find a parallel in the case of the white rabbit.

The human eye is indeed the mirror of the soul within, and no part of the face betrays so clearly the state of mind as do the eyes. The cold glitter of greedily, cunning avarice; the sneaking glance of the cringing sycophant; the firm straight look of the brave and strong; the restless motion of the anxious or fearful; the inquiring gaze, the hesitating, the angry, the smiling, the proud, the humble, and lastly, the lover's, combining admiration, feeling, and longing, and who knows what else besides!

An article on the 'Eyes of Genius,' which appeared recently in *Chambers's Journal*, began by quoting a saying of Emerson's, to the effect that 'Each man carries in his eye an exact indication of his rank in the immense scale of man.' Shelley, who himself possessed a pair of beautiful eyes, like those of a deer, uses some remarkable expressions in his poetry:

Like a Thought, which makes
Unwonted tears throng to the *horny* eyes—

the epithet being so descriptive of that cold, resolutely hard eye of the selfish man, which nought can soften, and to which tears even are unwonted.

Again, when Panthea enters in the second act of *Prometheus Unbound*—from which also the above lines are taken—and Asia says:

I feel, I see,
Those eyes which burn through smiles that fade in tears,
Like stars half quenched in mists of silver dew.

And further on in the same scene, Asia, knowing

that truth is to be read in the eyes rather than on the lips, asks Panthea to

Lift up thine eyes,
And let me read thy dream.

And when Panthea has spoken, but failed to convey her meaning to Asia, the latter says:

Thou speakest, but thy words
Are as the air: I feel them not. O lift
Thine eyes, that I may read his written soul!

Panthea. I lift them, though they droop beneath the
load
Of that they would express: what canst thou see
But thine own fairest shadow imaged there?
Asia. Thine eyes are like the deep, blue, boundless
heaven
Contracted to two circles underneath
Their long fine lashes; dark, far, measureless,
Orb within orb and line through line inwoven.

THE WILD WHITE MAN OF NORTH QUEENSLAND.

THE doings of white men amongst the aborigines of Australia are indeed interesting records, and many of the stories seem stranger than fiction, especially when there exists in the minds of Englishmen an idea that that race of mankind partakes a little of savage cannibals. Amongst those persons who have abandoned civilisation and lived for a time amongst the Australian Blacks, as that race is generally but wrongly called, the most interesting perhaps is James Morril, the Wild White Man of North Queensland, who spent seventeen years amongst that people.

On the 28th of February 1846, a barque named the *Peruvian*, of Dundee, left the port of Sydney, New South Wales, bound for China. She had a crew of twenty-two, all told, and was commanded by Captain Pitkelly. There were fourteen sailors, amongst whom was Morril, and seven passengers—Mr and Mrs Wilmot, their child and nursemaid, Mr J. B. Quarry and child, and Mrs Pitkelly, the captain's wife. For a full week the vessel experienced tempestuous weather, and was blown along for several days with only the bare masts. Early on the morning of the second Sunday out (March 8) the vessel struck on the Horseshoe Reef, one of the dangerous shoals of the great Barrier Reef which stretches for nearly twelve hundred miles along the Queensland coast, south-east of Port Denison, and was soon washed up so high that only the spray from the breakers reached her. The boats were destroyed, one at the time of the collision with the rocks, and the others when attempts were being made to leave the vessel in them. The second-mate was washed overboard by the first sea that swept the vessel after she struck; and the first-mate, who was the captain's brother, was lost whilst he was endeavouring to make the last remaining boat fit for the sea. From casks, rigging, spars, &c., a raft was formed, upon which the survivors, after securing a cask of

water and some tinned meat and soup, drifted from the wreck. Their sufferings during the days that followed were fearful. For twenty-two days they drifted about without any signs of rescue from passing vessels, when Mr Quarry died. Next followed his child, Mrs Wilmot and her child and the nursemaid; then the carpenter, cook, and two seamen, two apprentices, and two black men. Provisions soon began to run short; but when the pitiful community took to the raft they had made a unanimous determination that, come what would, no proposition should ever be made or entertained to sacrifice any one as food for the others. One morning they saw the topsails of a brig, only to watch it disappear as the breeze freshened with the opening day. Again the raft drifted on the Barrier Reef, and two days afterwards they sighted Cape Upstart. Tossed hither and thither with the tides and currents, they came in view of Cape Bowling-green two days later.

At last, after forty-four days from that on which it drifted from the wreck, the raft was washed ashore on the north-eastern side of Cape Cleveland—the captain and his wife, Mr Wilmot, Millar (sailmaker), Gooley and Morril (seamen), and Wilson (apprentice), seven in all, reaching the land alive. Shortly after landing, Mr Wilmot and Gooley died; and Millar, finding a native canoe, paddled away in it, in the hope of discovering food and relief; but he never returned, his body being found some time after by the natives. The survivors sheltered themselves in a kind of cave, subsisting on shellfish for a fortnight, when some members of one of the aboriginal tribes found them. At first, they were afraid of the white people; but soon each of them became the centre of a group of the dusky race, whose curiosity led them to examine each carefully from the crown of the head to the sole of the foot. They next supplied them with food, and by signs indicated the direction in which there was plenty more. That night, both blacks and whites camped and slept together; and next morning they all started off for the big camp, Wilson, the young apprentice, who was a mere boy and almost unable to walk, being carried. On arrival at the camp the white people were supplied with food, but carefully covered with boughs, to conceal them from the general gaze. Members of the tribe from the surrounding district kept coming in, and a grand exhibition was made of the articles that had been found with the whites. When they were brought forth for public view they were observed by some of the people with curiosity, whilst others ran away in fright.

After a short time, the shipwrecked survivors were conducted to huts prepared for them, at the entrance of which small fires had been lit, and were supplied with such food as the aborigines possessed. For a long time parties of the tribe, which was a large one, kept arriving to see the strangers, who settled down as mem-

bers of the wild community. They were shown how to obtain food, but although treated with rude indulgence, they suffered frightfully. The whole of the poor unfortunate creatures struggled along together for twelve months, when the captain died, and his unfortunate wife only survived him three months, dying of a broken heart. The remaining two endeavoured to find their way south, but got no farther than where the present town of Bowen stands. Twelve months after the death of the captain, the young apprentice died; and Morril was left the sole survivor of that ill-fated party, with only the aborigines for his companions.

During his residence with this tribe of the Australian race, Morril accompanied them in their marches, fought with them in their tribal wars, went with them on their hunting expeditions into the country, or their fishing excursions to the sea-shore. He soon lost all European habits, and forgot almost his mother-tongue, becoming, in fact, a real domesticated aboriginal. At first, his associates at times treated him roughly, and would perhaps have killed him but for the interference of the women, with whom he became a great favourite. One old woman went so far as to recognise in him a dear departed son, who in dying hoped that he should return 'a white fellow.' During the early part of his sojourn in the bush he used to build 'gunyahs,' or huts, to sleep in during wet and cold weather; but as the natives often expelled him from his retreat and took possession, he discontinued labouring for their comfort. After this, he frequently covered himself with a sheet of bark during wet nights, when he slept tolerably well, and was fairly comfortable. The domain of the tribe with which he associated extended from the Burdekin River to the Black River, a distance of some thirty miles; and their headquarters were in the pockets of Mount Elliott, one of the highest mountains in Queensland, rising 4075 feet in height. A favourite haunt of the tribe was near Cape Marlow, about twenty-five miles northwards, by the shores of Cleveland Bay, and here Morril spent much of his time. Often did he climb up the rugged sides of Castle Hill, and from the summit scan the blue waters of the bay, in the fond hope of seeing a sail that would rescue him from solitude; but for this trouble he was never rewarded.

In 1861 he heard that white people had been seen in the neighbourhood, and with the object of coming in contact with them, he joined a friendly tribe who inhabited the country lying between the Burdekin and Cape Bowling-green. This tribe did not contemplate his leaving them, and for his own security from other tribes of an unfriendly disposition he was never free nor safe to go off alone on an expedition of discovery; and even had he come suddenly in contact with those of his own race, he would undoubtedly have shared the fate at that period indiscriminately meted out to the aborigines.

During the early part of January 1863, the tribe with which he lived organised a kangaroo battue in the near vicinity of a sheep-station on the Lower Burdekin, and one day Morril was detailed with a party of the women to look out for whites. One of the women who had strolled

off by herself soon told Morril that she had seen a white man's hut, and when she was directing him to the locality, they sighted some sheep. Upon Morril deciding to go on, the woman ran back. He then went to a water-hole, where he washed himself so as to appear as white as possible, and walked on in the direction of the sheep. Soon he came in sight of a yard, and then a hut, from which he heard voices, and at that instant felt confused and alarmed, and was almost impelled to run away. Mounting as high as he could on the fence, he called out the sailor's salutation he had so often repeated to himself when alone: 'What cheer, shipmate?' On hearing this, one man looked out of the hut, and seeing Morril, who was wild-looking in appearance, immediately called out: 'Come out and bring the guns, Wilson; here's a naked man on the fence that is white or yellow, but is not black!' Morril then threw up his arms and called out: 'I am a shipwrecked sailor. You would not shoot a British subject!' Then the men, who were stockmen, and who had regarded him as some sort of a bushranger, took him into the hut and gave him bread to eat, which at first he could not swallow. Having almost forgotten the English language, it was some time before he could explain himself to the settlers. That night he returned to the aborigines' camp, and upon his advice, they moved off some miles farther from the hut. When he told them that he intended to return to the whites, the natives at first understood that he would be away for three or four days only, and begged of him to talk to his countrymen and tell them not to shoot the natives. When they learned that he was going a long way off to see a great many whites, and that he would be away three or four moons, some of them declared that he was going to leave them altogether. Some in anger told him to go, saying that he would be drowned with the rest of the white men. Years before this, numbers of them had lost their lives during a great flood, and it was a consoling belief with the survivors that another great flood would drown all the white men, with their horses, cattle and sheep. Others lamented that he would be too far away to do anything to save them from the whites. They begged of him to induce his countrymen to let them have at least the swamps and salt-water creeks, upon condition that they (the natives) abandoned the upper reaches and rivers. With much lamentation on the part of many of his tried associates, on the following morning Morril ended his almost seventeen years' sojourn among the natives.

Morril was not, however, long to survive his release. Mr James Gordon, at that time the sub-collector of Customs at Bowen, took him to Brisbane, and presented him to Sir George Ferguson Bowen, the Governor of Queensland, who, however, took little interest in the 'Wild White Man.' Whilst in that city he joined the Baptist Church. Returning to Bowen, he was employed in the Customs department as one of the crew of the pilot-boat; and in 1864 he married a servant of the police magistrate's of that place. Townsville, now the leading city in North Queensland, and the seat of a bishop and his cathedral, was then just beginning to grow on

the shores of Cleveland Bay, and at the foot of Castle Hill, the peak Morril often climbed to scan the horizon in search of a sail. In April 1865 the first bonded goods arrived at the new seaport in the schooner *Ariel*, in the charge of none other than Jimmy Morril; and in June of the same year, when the first land of the new town was sold, a quarter of an acre was knocked down to Morril at the upset price, no one being inclined to bid against him, and thus he obtained an allotment of land in what he termed his country. He died in the following October at Bowen, leaving a widow and a posthumous son, who, at the time the writer of this article was a resident in Townsville (1886-89), was driving a team in the neighbourhood of that city. From the time of his release from the aborigine life to his death, Morril always had a deep affection for the aborigines; and Mr Gordon, the person above named, informed the writer that he used to relate some very touching incidents concerning that race, which often brought tears to his eyes.

ONE DAY.

I.

It came not when the roses grew
In pale and ruddy splendour;
When crystal drops of pearly dew
Lay in their petals tender;
When calla-lilies tall and fair
Their sweet perfume were flinging;
When soaring larks high in mid air
Their lays of love were singing.

II.

Nor yet when gaily in the meads
The daisies white were bobbing,
When through the sedges and the weeds
The soft south wind went sobbing;
The violets saw not that day,
Nor yet the primrose sprightly;
It came in mists and vapours gray
That day that ended brightly.

III.

The purple clouds high overhead
Fantastically were shifting,
And leaves of russet, gold, and red
From off the trees went drifting.
I know how fast my pulses stirred
That day in late November,
When some one softly spoke a word,
A word I well remember.

IV.

A simple word, and yet I thought
The branches bending o'er us
Took up the word as if they sought
To make a joyous chorus,
If flowers were dead and bird-notes stilled,
I heard the old sweet story,
That autumn day, 'I love you' filled
With more than summer glory.

THAT SUPPLE BACKBONE.

BY MRS LYNN LINTON.

As we cannot have everything in life we must content ourselves with a portion, and he is the wisest man among us who knows most clearly what portion he desires and bends all his energies with most earnestness in trying for it. But he is a fool who wants two irreconcilable things—who thinks he can hold with the hare and run with the hounds, and turn up smiling with the victors at the end. One of two contraries a man has to choose between—the stiff upper lip of the independent or the supple backbone of the time-server. If the former, he will keep his own self-respect and gain the respect of others, but also he will be sure to have the ill-will of his superiors, and be under the frost of those whose doubtful bottles he refuses to hold and whose muddy boots he declines to black. If the latter, he will in all probability come to worldly success, and find grateful patrons willing to give him a good push forward in return for his complaisance to them. But though he may be praised as a good-natured accommodating fellow, he will not be esteemed; nor will he be able to respect himself—conscious, as he will be, that he has not kept alight the sacred flame of masculine honour. All the same, that supple backbone will lead him far; and if that is what he wants, let him rejoice and be glad—but he must not be nice as to the road by which he travels nor the means by which he arrives.

Co-trustee with the unscrupulous scoundrel, but himself not naturally dishonest, that supple backbone has rather a heavy load to bear. A few years ago that clipper A1 at Lloyd's cost seventeen thousand pounds, and to-day is even in better condition than when she was built. The trustees decide to sell her for the benefit of the widow and orphans. The strong-willed superior so decides; that supple backbone of the inferior bends as usual and acquiesces. The ship is sold to the brother of the former, who gives seven

hundred pounds for his bargain; and the latter has not the courage to remonstrate. He does not pocket a 'red cent' himself, but he has not grit enough to stand out for justice and honesty, and so consents unto sinners, and is lost with them in the same deep pit of shame.

The managing clerk of a conscienceless attorney, with that supple backbone draws out a bill of costs that will stint the poor client for many a year to come—writes down the heads of an affidavit which he requests the unwary dupe to sign at the foot of the page, leaving a wide space of blank paper between—carries the hush-money by which a dangerous witness is bought off and justice effectually defeated—carries the bribe by which a double tongue is secured, and he who would have told the truth is bound now to the maintenance of a lie. All this he does without remonstrance, without hesitation—not because he is indifferent, but because he is a coward and a tool, and that supple backbone has not the power to stand upright when the hand of a stronger is laid on it. What indeed will not one of this kind do when under such pressure! There is no villainy for which a tool is wanting. Were all men who are not naturally evil, stiff-backed, there would be infinitely less crime than there is. That supple spine makes itself the hand to do the dirty work of the stronger; and between the bold brain to plan and the complaisant agent to effect, no crime is too bad, too base, or too mean to fail in execution. Ah! that supple backbone has much to answer for! As the receiver is as bad as the thief, so is the living tool that does the work as guilty as the one who plans the deed. His weakness matches the other's boldness, and is as the powder by which the ball is sped.

That supple backbone finds no more difficulty in flattery than it found in complaisance. The veriest old hag with money has her poet to praise and her artist to flatter her; the dullest block that ever wore a wig has courtiers as grovelling as worms, and with backbones as supple as that of the looped caterpillar, if he is highly placed and grandly named and standing on

the stage where the rich and powerful assemble. Men and women, with spinal columns as flexible as so many reeds, gather about the titled block and belaud and bepraise him as though he were a nineteenth-century demigod born within the sound of Bow Bells, instead of as in olden times to the chanting of Homeric hymns and the cries of *Evoë, Evoë!* No matter by what shady means he has made his money—it is made, and it is money. He has the influence of wealth, of position, of social power; and the flexible backbones bend before him, proud in their self-abasement. They are all on the lookout for crumbs, like so many gaping carp at the edge of a pond; and when those crumbs are thrown, then is their satisfaction assured and their self-abasement complete.

On all Boards, Committees, and the like, is sure to be such a proportion of these supple backbones as ensures the due despatch of business. Every 'strong' man has his following, and these outnumber the dissentients, who, moreover, do not organise. Talk of pocket boroughs—why! every man who does public business knows what it is to have so many votes in his hand, safely lodged there simply because of the suppleness of sundry backbones! In all parochial work the supple backbones carry the day. When by chance a rector is weaker than his recalcitrant parishioners, the coil into which things get is lamentable; for the minister is *ex officio* the lawful head, but what can the lawful head do when opposed by a rebellious tail? This suppleness of backbone, indeed, is the very essence of party government. The units of the party must have no sense of right or wrong—must not harbour such an inconvenient thing as a conscience—must look on a stiff upper lip as a moral blemish—must cultivate a willowy set of vertebrae, which sway into the right hand lobby or the left according to the bidding of the fogleman. The independent members are like those strange bodies which fall to the earth unbidden, no one can calculate when or where. But the supple kind make the life of the party and the continuance of the ministry.

What is public opinion but the consentaneous swaying of the supple backbones of society, as the ears of a barley-field which the wind passes over? Shout a thing loud enough, and shout it often enough, and you will get believers and repeaters and followers. It is all a matter of strength of lungs and suppleness of backbones. The few who dare to stand out against the popular cry of the moment are those unmanageable creatures with stiff upper lips—too stiff to bear with hooks and bridles. The majority are glad to be saved the trouble of independent judgment, and the still greater trouble of digging down to the root of things. Those supple backbones cannot do this. The utmost they can accomplish in that way is a little surface scratching about the upper part of the field—there where Public Opinion is shouting out her laws. When they have scratched about as deep as a bumble-bee might, they proclaim themselves satisfied and illuminated. Then they, too, bow before the 'mawmet' of the moment and invoke anathemas on those bold 'pies' who dare to

intone their psalms in a different key. Think of what would have befallen the man with the stiff upper lip and independent judgment who, when the rushing crowds tore through the streets of Paris shouting '*à Berlin, à Berlin,*' had confronted them with a negation and an exhortation to turn back and leave off screeching! They would have made short work of such a one; and the supplest of those swaying backbones would have been the cruellest in the punishment. No; it requires exceptional courage to stand out against a popular cry; and only those who have cultivated clearness of understanding, honesty of purpose, and boldness of mind, can face the obloquy resulting from the opposition. That supple backbone which bends to the breeze and swims with the stream is then the safest—whether the most respectable profession is another matter.

Even in private life, where sweetness of disposition and complaisance of habits are of prime importance, a swaying backbone, over-supple, is a nuisance rather than a pleasure. Tyrants alone like to live with slaves; but even they will compound for the shock to their dignity given by the insubordination of a rebel, for the pleasure they have in crushing him. But not the hardest-handed husband—not the most self-willed wife, likes to feel that the 'environment' in which he or she lives is nothing but one great amorphous mass of jelly—a slimy slippery substance which yields on all sides and takes no permanent shape—which has no form and no colour and no independent life of its own, but is just a slippery slimy mass to be run into any mould that is desired. A woman who has no opinions of her own, no principles, no thoughts that are not prompted, no likings that are not shared, becomes in time more irksome than even a fiery little 'scrat' who fights over the best way of making mutton broth, as if it were a matter of vital importance to body and soul, and who refuses to be guided or governed by living man or established code. If this last bantam is provoking, the invertebrate molluscous creature is maddening. Swansdown is all very well in its place, but when we want a serviceable rope we take hemp or haphy metal and let the soft stuff fly into space. To be able to say No to another's Yes is sometimes both necessary and wholesome, and also gives more happiness than the more servile echo. There are occasions when that No is our bounden duty—when the echoed Yes would be a sin. But sin or not, that supple backbone sways to the side of Yes; and what mischief can be caused by this complacency is caused—with no self-blame accruing.

So that on the whole a supple backbone is a doubtful good, for all the sweetness and good temper with which it is associated. It can so easily run over into servility—into unfaithfulness—into want of self-respect all round! We all have our hidden treasures of thought and principle to guard; and we must keep that dragon we call our conscience awake and not set it to sleep with cakes here or sweet songs there. And we all have that thing we call our self-respect to maintain; and when the backbone is too supple, this slips away like that jelly we spoke of, and we hold it no more as our own. As a rule, this invertebrate molluscousness does not belong to the northern nations; but even they need to

be prodded now and then—to be brought back from over-suppleness by reminders of what the brave past was, and what it did for them and gave them.

DUMARESQ'S DAUGHTER.

CHAPTER XLI.—THE MYSTERY SOLVED.

To Haviland Dumaresq's delight and surprise, Psyche still bore up bravely. Why, it would have been hard indeed to say. Whether, in spite of herself and her gloomy presentiments, she still cherished internally some secret hope that Linnell after all might have escaped from Khar-toum and across the desert to Biskra, he hardly knew; but in any case, he was pleased to find her still so buoyant. He hugged himself on the discovery. This trouble would pass over in the end, he felt sure. The mistress of such a splendid fortune as hers must surely be happy!

Poor sordid old thinker! For himself, he would have scouted all ideas of gain; but for Psyche—he was as greedy as the veriest money-grubber in the city of London. Nay, in his own mind, Haviland Dumaresq already gave himself, on Psyche's behalf, all the airs and importance of a wealthy person. Psyche was now a lady of position. He could hardly help letting Sirena feel the difference in his treatment of herself. And even to Psyche he often implied by a half-uttered side-hint that he regarded her as the possessor of a great estate, with infinite possibilities for the future still lying before her.

But Psyche, poor Psyche, only shrank back in horror from the hideous thought, and cried to herself with unspeakable remorse, a thousand times over, 'His money! His money! And I sent him to his death! I could never touch a single penny of it.'

And still she bore up, till despair should deepen into perfect certainty. For her father's sake, and with all the force of her father's nature, she strove to be calm: she schooled herself to fortitude—till news should come from Biskra.

One bright afternoon, Sirena and Dumaresq had taken her between them out upon the dry African hillside, where the pine-trees grew green and the broom blossomed yellow, and the chirp of the cicadas resounded from the rosemary. They seated her down on the arid rocks, under the shadow of a tall and flowery eucalyptus. Birds sang, and bees hummed, and in the valley beneath, the murmur of water plashed among the stickles. The high-road to Birmendreis ran just below them as they sat, and Psyche, looking down at it, with all her might, half fancied she could dimly make out a long white line that threaded the valley; for her eyes were almost wholly blinded now, and she never expected to see any more with them.

As she looked, however, and strained her eyeballs, dark objects passed now and then in shadowy show along the white strip, as one may sometimes see reflections from the street thrown up in vague outline on the ceiling through the curtains. One of them, Sirena said, was an Arab on a donkey; another, a cart going in to Algiers with fruit for the market; a third, a group of veiled Moorish women, coming home from their weekly visit to the cemeteries. Psyche could

dimly realise, when told, how each object answered to Sirena's description.

And then came a fourth, a smaller one than the rest; and that, Sirena imprudently blurted out, was a telegraph boy from the office at Mustapha Palais.

At the word, Psyche's heart rose up to her mouth within her. She followed the dark spot vaguely along the dim white line. 'He's going to the Orangers,' she cried with a start, as the object halted against a second white blur in the distance. Then the truth flashed across her with a wild surmise. 'Sirena, Sirena, it's a telegram from Biskra!'

Sirena, alarmed at her own imprudence, ran down the hill in hot haste and tore it open hurriedly. It was addressed outside to Haviland Dumaresq; but in her flurry and excitement she never paused for a moment to hesitate over trifles like that. A question of life and death was at issue now. She unfolded the paper and glanced at the contents. Her heart stood still within her in horror as she read: 'Patient convalescent and quite sensible, though very weak. He gives his name as Sir Austen Linnell, and has come direct through the Soudan from Khartoum. His cousin also escaped from the massacre, and accompanied him on his retreat as far as the desert, but was shot through the heart by Arabs near Ouargla some ten days since, and died without pain. Break the news gently to Miss Dumaresq.—VANRENNEN.'

So it was all over! The refugee was the wrong one!

She hurried back, panting, but restraining her tears with a terrible effort, for Psyche's sake, and handed the paper without one word of note or comment to Dumaresq. The gray old philosopher read doom in her face, but spoke not a syllable, lest the shock should come too suddenly upon Psyche. He took the telegram from her hands and read it through in silence. Psyche gazed up at him with appealing inquiry from those sightless orbs of hers. 'What does it say, Papa?' she murmured, gasping.

Dumaresq pressed her hand in his. His eyes were full. His voice was too choked for distinct utterance. 'My darling,' he whispered in a very low tone, 'try to bear up. For my sake, Psyche, don't let it kill you.'

Psyche glanced over his shoulder anxiously at the paper. Her eyes, too, were flooded with rising tears. She brushed them away and tried hard to spell it out. But it was too late now. No effort of will could bring back sight any more to those blinded pupils. Not even her eager desire to know the whole truth—to end this suspense, to face the worst—enabled her to break through that thick black cloud that obscured her vision. The world of form and colour was gone, gone utterly. She could see not even in dim outline. Nothing but darkness rose up before her.

'I can't make it out,' she murmured, grasping her father's arm hard. 'Read it to me, Papa. I can bear it. I can bear it.'

Dumaresq's voice faltered terribly. 'I can't read it,' he cried in turn, breaking down in the effort.—'Read it to her, Sirena. I've no voice left. The worst will be better than this suspense she's been living in.'

Sirena read on as far as the words, 'Sir Austen Linnell;' then Psyche's breath came and went suddenly, and she clenched her hands hard to keep herself from fainting.

'And *Him*?' she said slowly, holding up with an effort. 'Does your brother know anything about *him*, Sirena?' And those dim eyes fell upon her faithful new friend with unspeakable pathos.

Sirena hesitated a second in doubt. Then, in a voice half broken by irrepressible sobs, she went on once more till she came to the words, 'died without pain! the Arabs at Ouargla!'

Psyche drew a deep breath again, and sighed once. Strange to say, she seemed more composed now at the last moment than either of the others. Surely the bitterness of death was past. Compared to her worst fears—her worst dreams of unspeakable Oriental torture—that 'died without pain' was almost comfort.

'I know when he died,' Psyche murmured low after a short pause: 'I had a presentiment. That day when I saw him lying dead by himself on the sands in the desert!'

Her unnatural composure terrified Dumaresq. Such deadly calm at such an awful moment could bode no good. He peered down into her eyes, those deep, clear eyes of hers, and saw they were now tearless as well as sightless. 'Cry, darling, cry!' he exclaimed in his terror, clasping her to his bosom in an access of wild despair. 'Cry, Psyche, for my sake, try to cry! If you don't, your grief will surely kill you.'

'I can't, Papa,' Psyche answered quietly, as pale as death, but horribly calm and immovable. 'I cried so much at Petherton—in the nights—alone—when nobody knew I was crying at all—that I taught myself how to cry, internally, somehow. And now, when I'd like to let the tears come most, I feel I can't. They won't break through. My eyes are so hard—like iron balls. There's no cry left in them.'

The old man seated her gently on the rocks once more. Those great blind eyes of hers gazed blankly and despairingly over the dark, dark world that stretched in front of her. She had nothing left to live for in it all now. She sat bolt upright, immovable as stone. Her heart stood still like a stone within her. She said nothing, she saw nothing, she thought of nothing. A great numbness seemed to steal over her senses. She wasn't even unhappy in any active sense. She was conscious only in a dreary, weary, half dead-alive way of a vast calm blank spread for ever before her.

She was sinking, in fact, into utter lethargy. Long grief and despair had driven her senseless.

They sat there long, those two others, watching her anxiously. Many times Sirena looked across with a mute inquiring look in her eyes towards Haviland Dumaresq; and each time the gray old philosopher, heart-broken himself and torn with remorse, framed his lips into a mute *no* when Sirena would have spoken to his heart-broken daughter. It was better to let this dazed and paralysed mood wear itself out to its natural term by pure inanition. Psyche had so discounted her grief already that the final announcement came, not as a sudden shock, but merely as a clear and fatal certainty where before there had been nothing but doubt and hesitation.

At last, with a sudden return of power, she rose from her seat on the great rock, and moved towards the house, neither seeing nor yet groping, but finding her way, as it seemed, by pure instinct. Her tread was firm and her voice steady. 'Say nothing of all this at the villa, Sirena,' she said calmly, turning round, as she reached the road. 'I can bear it all now. I feel stronger already. He died without pain, Sir Austen says. And it's something at least to know exactly what happened to him.'

Sirena walked on by her side and wondered. But in truth Psyche had no reason to weep. A strange yet natural strength seemed to buoy her up. It was the strength of despair, backed up and reinforced by the strength of duty. Her own life was cut off from her altogether now. She had nothing left to live for henceforth but her father. When *he* was gone, she might fade away as she would, like a withered flower.

A NEW DEPARTURE IN PROFIT-SHARING.

By far the most striking and original method of solving the social problem, the relation between master and workmen, in force at present, is that founded and carried out by Mr Alfred Dolge, proprietor of lumber-mills, and the largest piano-felt and felt-shoe manufacturer in America, at his factories in Dolgeville, New York State. The sleepy village of Brockett's Bridge has been transformed mainly by his capacity and business energy into a busy hive of industry, and has assumed the name of its benefactor. It is interesting in another sense as the scene of a social experiment which has proved successful so far as it has gone, and which its founder terms *Earnings-sharing*, as distinguished from what is generally called '*Profit-sharing*,' in which Mr Alfred Dolge is no believer. The Emperor of Germany recently expressed his high appreciation of this attempt to solve the labour problem.

Edme-Jean Leclair, the Parisian painter and decorator, is the father of modern profit-sharing; but the past few years have witnessed other no less hopeful and interesting developments. Since 1843, when Leclair astonished his sceptical workmen as to his intentions by throwing a bag of coin (four hundred and ninety pounds) on a table for distribution amongst forty-four of them, developments of his system have spread. In 1891, about fifty British firms, eighty-one in France, Alsace, and Switzerland, and twenty-nine in the United States of America, practised some system of profit-sharing. A usual agreement in the case of British firms adopting the system is, that the surplus profits of the business (if any), beyond such definite sum as is for the time being reserved to the firm for their own benefit, are divided into two equal parts: one part is distributed (not of legal right, but gratuitously) as a bonus to the employees in the manner adopted in the rules of the firm; and the other part is retained by the firm. This does not entitle to any voice in the management, and its weak point is that drones and working-bees have share and share alike. The plan we here describe seems fairer, in so far that it is based on the

workman's own earnings; and in the case of the firm adopting it, strikes and labour troubles are unknown.

None of the pioneers of profit-sharing have ever posed as philanthropists; they have simply acted as business men anxious to improve the prosperity of their different establishments by turning out good work, promoting greater care of implements and economy of material, and welding in closer relationship master and workman. Leclair on being styled a philanthropist, said: 'I am simply a business man. I would rather gain one hundred thousand francs and give away fifty thousand, than gain twenty-five thousand and keep the whole for myself.' Mr Alfred Dolge, whose system we describe, at his annual reunion at the close of last year repeated what he had told his workmen over and over again, that his plan of distribution of earnings was not an act of benevolence, but simply a matter of business on his part. He had always aimed at producing the best quality of goods that could be made. He knew that he could not do so unless he interested his employees in their work, so that they might use their best endeavours, and tax their brains to improve its quality and lessen the cost of his products. Justice dictated that demanding this from his workmen, he owed them the compensation of more than ordinary wages.

A brief outline of the more prominent methods of profit-sharing will enable us to compare them with that of Mr Dolge. Leclair found that a mutual aid society which he had established in 1838 became 'a powerful means of moralisation and a living course in public law.' M. Frégier in 1835 had dropped the hint to him that the best expedient to adopt in doing away with the antagonism between capital and labour was to allow the workmen some participation in profits. Neither Leclair nor the author of this suggestion took the matter seriously at first, until the house-painter, after much thought, concluded in 1842 that the thing appeared to him possible and one of the simplest to put into practice. As now constituted, the net profits of the firm are divided in certain fixed proportions between the managing partners, mutual aid society and the regular workmen. Five per cent. on the capital of four hundred thousand francs is deducted like wages from the gross profits in order to find the net profits; fifty per cent. of the remaining profits go to labour in cash, twenty-five per cent. to management, and twenty-five per cent. to the great provident society, which is now half owner of the capital of the firm. Between 1842, and 1872 the year of Leclair's death, the mutual aid society and his workmen had received forty-four thousand pounds; in 1882 the sum had reached one hundred and thirty-three thousand pounds. In 1882 and 1889 the dividend that was paid to wages was over nine thousand pounds in each case. The effect on the workmen has been to help to make them sober, thrifty, and industrious.

Other notable profit-sharing concerns are the Co-operative Paper Works, Angoulême, founded by M. E. Laroche-Joubert, where the dividend is paid in cash; and between 1879-88, more than forty-four thousand pounds was so distributed over and above wages. At Godin's iron foundry, Guise, employing sixteen hundred hands, the

workmen's share of profits accumulates towards the purchase of shares in the firm. Profit-sharing in some form has been in force here since 1877, and began with a bonus. Nearly one thousand workmen received additions to wages in 1889. The result is that out of a 'squalid, ignorant peasantry' he has produced an industrial community with the discipline of a regiment and the commercial alertness of the market-place.

The celebrated scheme of Messrs Briggs, Whitwood Colliery, Yorkshire, lasted from 1864 to 1875, until the participation of the workmen in a strike caused its collapse. When the net profits exceeded ten per cent. on the capital embarked, all those employed by the company, managers, agents, or workpeople, received one-half of this excess profit, in proportion to their respective earnings. About thirty-four thousand pounds were so distributed in nine years. We have not space to mention here the names and methods of the fifty British profit-sharing firms. These will be found in Gilman's *Profit-sharing*, and in the description of the Profit-sharing Scheme by Bushill, Coventry.

It is worth noting that at Shanghai, where few of the local native banks have a capital of more than ten to fifteen thousand pounds, every employee down to the lowest coolie has a share in the annual division of profits.

Mr Alfred Dolge, after a study of all the known systems of profit-sharing, came to the conclusion that the one he has adopted is the only practicable one for the amelioration of the condition of working-people. It is not Profit-sharing, but Earnings-sharing; and he says it does not in the least resemble communism or socialism, or the scheme of paternal government now in practice in Germany. It depends entirely on the development of each employee's individuality, and places him on the same level with his employer. So-called profit-sharing, as generally practised, he considers as simply the division of a certain share of the earnings, not of the profits of the business. He objects to the lazy and incompetent workman receiving the same percentage as the intelligent and industrious one, as it appears to him to destroy all individual ambition, and is a kind of alms-giving. Besides, if the profits of a business are to be shared by employees, then it follows that they also share the losses.

Alfred Dolge was born at Chemnitz, Saxony, in 1848, and learned his father's business of piano-making. He went to New York in order to perfect his knowledge of piano construction, returning to Leipzig in 1868. His visit to America determined him to settle there. When Dolge came back to New York, he found work in a piano establishment, and soon noticed that the quality of the hammer leather was very poor. He knew that a much better leather was to be had in Germany, and so he ordered a small quantity by way of experiment. His first venture was so successful that it was soon repeated, and he made a handsome profit by the sale of his skins to piano-makers. He induced his employer, Mathushek, also to import Poehlmann's wire, which was found more suitable for upright pianos. A reduction of wages at the factory in New Haven, in 1869, made him quit the bench and start as an importer of piano materials. He succeeded in placing the materials of the German manufac-

turers on the American market in spite of strong competition. There was one article used in the manufacture of pianos, hammer-felt, which he had not in stock; it had to be imported from Europe; and there were only two makers of it. Dolge determined to begin its manufacture in America and organised the Eagle Felt Company. He had many difficulties to contend with ere he produced good felt for the piano-manufacturers, and lost a considerable amount of money. The excellence of Dolge's manufacture, however, was recognised at the Vienna Exhibition of 1873; and next year the demand had so increased that he had to enlarge his factories at Brockett's Bridge, the village, about two hundred miles from New York, which is now, after himself, called Dolgeville. The village is on the verge of the Adirondacks, has a population of two thousand five hundred, between six and seven hundred of whom find employment in Dolge's factories. The increased demand for organ and piano felt continued not only in America but in Europe, and sawmills and lumber-factories for the making of sounding-boards were added. The felt-shoe industry was also begun, and now fifteen hundred pairs of shoes are made every day in Dolgeville. A business of over three hundred thousand pounds was done in 1890. His own success is reflected amongst his workpeople; and in Dolgeville, which he has largely built up, he has opened roads, introduced the electric light, and contributed most of the funds for an excellent school-house, towards which he subscribes five thousand dollars annually. He has also given a park of four hundred acres to the workpeople, assisted them in building houses, founded a club-house, where good entertainments are given, and a free library.

The result of Alfred Dolge's practical experience, and study of political economy, is comprised in his earnings-sharing scheme. In the creation of wealth he claims that certain of the employees contribute a larger share than is represented by their wages, which are regulated by market-rates; and that these earnings can be determined by a method of book-keeping; and that it is the duty of the employer, as a simple matter of justice, to pay such employees their real earnings, and not merely their wages; and that by so doing he will prevent strikes, produce better results, and in the end profit personally thereby. Alfred Dolge formulated his scheme by the help of the best legal advice. It embraces: (1) A Pension Scheme; (2) an Insurance Scheme; and (3) an Endowment Scheme. This differs from many forms of profit-sharing in that there are no cash payments. The following came into force on January 1st 1890, after several years' experimenting with a Pension (1882) and Life Insurance plan (1886).

Under the Pension Scheme, every employee over twenty-one, and under fifty years of age, after a continuous service of ten years, in case of inability to work through any cause, is entitled to a pension at the rate of fifty per cent. of wages earned during the last year next preceding that of stoppage of work; this rises by gradations to one hundred per cent. after twenty-five years' service. This pension is paid from a fund contributed to by the firm, on account of every employee, according to age and wages earned. The pension fund will soon be self-supporting,

and showed a balance in hand last January of thirteen thousand dollars. Nearly three thousand dollars was paid by the firm to the pension account in the previous year.

Under the Insurance Scheme, every male employee after twenty-one, for each five years of continuous service, is entitled to a Life Insurance Policy of the value of one thousand dollars; so that, after fifteen years' service, he is possessor of three policies worth three thousand dollars. Seventy-five policies of a value of one hundred and thirty-eight thousand dollars were in existence in January last, and the premiums paid by the firm during 1890 amounted to over five thousand dollars.

Under the Endowment Scheme, every male employee who has been in the service of the house for five years is entitled to an endowment account, upon which he will be credited at the end of each year according as the manufacturing record shows that he has earned more than has been paid to him in the form of wages. Any losses caused through bad work are charged against his account. This endowment money is payable only at his arriving at the age of sixty, or at death. Interest upon any balance is credited at the rate of six per cent. at the end of each year. Since this system of earnings-sharing began a few years ago, Mr Dolge has paid to assistants, foremen, clerks, and working-men, and for their benefit, over one hundred thousand dollars. None of these laws, of course, deprive the house of the power to discharge a workman for any good reason, or alter the right of the workman to quit at any time. A neat passbook is put in the hands of each workman containing the printed laws of this system of distribution of earnings, with blank columns in which the share falling due can be entered.

The wise and practical advice given to his workmen at the annual reunions is always good. Mr Dolge told his workmen once, if they wished to increase their earnings, to live better and enjoy more comforts, they must cultivate their minds, use their brains, and develop their intelligence to such a point that they might use their mental and physical powers to the best advantage; for that, after all, was the only advantage that he or any other employer had in the race of life over his employees. Brains more than the exertion of muscular force had built their imposing factories, developed the felt business and the elegant styles of the shoes produced. Brain-work was better paid because it produced higher and wider results than manual or merely physical labour.

A NOBLE REVENGE.

PART III.—A FRIEND IN NEED.

THE entrance to Providence Court, Bucklersbury, is so narrow, being an arched passage, that it can easily be passed unnoticed. This passage running through a house to the rear opens on a small paved yard. Gloomy even in summer, overshadowed by tall buildings on all sides, it is chiefly occupied by the offices of various agents. At the farther end, in the darkest corner, a small house of two stories was occupied by Mr Issachar, the usurer and money-lender. He resided there all the year round, never taking

a holiday, having given up all recreation years ago, when he buried his Christian wife, for whose sake he had been cast out from his people. His only diversion was money-making, not on account of the luxury it purchases, but as an amusing game of speculation. He had no children to inherit it. His affections had withered up, for he was alone in the world. In leading a meditative life, his intellect had become clearer than ever. His advice was sought in many a pecuniary speculation. Those who took it generally prospered.

One fine morning Mr Issachar sat at a desk close to the wire-blind at the window of his dark office, upon which the sun never shone. Though a hot day on the outer side of the passage, it was chilly in the court, and Mr Issachar had a fire. He was engaged in taking extracts from financial papers. A small spare man, with hair and beard white as snow, wearing a velvet cap and gold spectacles. His complexion was of the clearest olive; his forehead high, crossed and recrossed by countless lines, delicate as cobwebs; a fine brow, under which his Oriental, long, and even beautiful brown eyes still retained their lustre.

Presently footsteps broke upon the silence of the court. Mr Issachar raised his head, listening. They advanced towards his house. 'The trained walk of a gentleman.' Long practice had enabled the Jew to judge of a person's position by the tread. 'Military, I think,' said he.

The regular tramp, tramp of the footfalls stopped at his door, and there was a rap from the highly polished brass knocker, which had been screwed on when the house was rebuilt immediately after the Fire of London.

The door was opened by a young clerk, a German Jew, for Issachar clung to his ancient race. 'A gentleman wishes to see you, sir; he will not send in his name.'

'I will receive him.' Mystery surrounded so many of his clients, that this was nothing unusual.

The visitor was a tall well-made man, with a sunburnt face, and hair prematurely gray. Removing his hat as he entered the room, he stood for a moment regarding the money-lender without speaking, who on his side looked up at him with a questioning expression on his face.

'We have met before, Mr Issachar. Am I changed past recognition?'

The Jew fastened his intelligent eyes upon him, scanning every feature; then he said slowly: 'You are indeed altered; yet I know you by your figure, your eyes, your voice: they are the same as of old. To change like this in so short a time denotes mental suffering. You have been through a fiery furnace, Captain Gravenor.'

'So short a time! Why, it is eleven long years,' cried his visitor with a bitter laugh.

'To me it appears short because my life is monotonous. Many events, change of scene, cause time to seem longer. As you left me, so you find me. I have often thought of you—felt for your blighted life.'

'You believed in me—that is why I come to-day.'

'I never doubted your innocence. How long have you been back? Tell me your story.'

'But a few weeks. As for my story there is not much to tell. I was not badly treated on the whole—out there. I tried to become resigned

and found comfort by going back to the early lessons of a pious mother. Had she lived, I might have been a less thoughtless man.' He sighed. 'Well, I got a good name in several respects. When the time came for freedom, I went to Melbourne, and lived for eighteen months by my own exertions. I set up as an accountant and prospered better than I expected. But a desperate yearning for home possessed me. I returned—to learn that I had a son.' He buried his face in his hands. There was a silence.

'I, too, once had a son—he died. You are better off than I am. Yours lives.'

'He is ignorant that he has a father. They have even discarded my name. I have seen him. A noble boy, with his mother's beauty. Then I felt a wicked thirst for revenge spring up within me against the villain who has debarred me from the happiness of his infancy—of witnessing him budding into boyhood.'

'Never doubt but there is a hand that will repay. The treacherous only prosper for a time.—Can you fix upon your enemy?'

'Yes. But I have no proof.'

'There are strange mysterious agencies at work around us—hidden influences, which we human beings cannot fathom. How is it you walk into this room when I was just about to advertise for you?'

'For me?'

'Yes; for I knew the time had expired for your release. Lift that marble letter-weight on the table before you; read the strip of paper under it.'

Captain Gravenor obeyed. 'Captain George Gravenor, formerly of the — Regiment, is requested to communicate with Messrs Everett, Solicitors, Bedford Row.—Colonial papers, please copy.'

He let the paper fall from his hand. 'How wonderful—how extraordinary!' he cried.

'Listen!' said Issachar.

Captain Gravenor sat down quite overcome. Here was a friend—at last, at last—one who believed in him.

'Living here apart from the world,' commenced the Jew, 'it interests me to follow the career of many persons who pass as in a phantasmagoria across life's stage. A brilliant entrance—an exit to be soon forgotten. Monarchs have lived and died; dynasties have passed away; new countries risen. Statesmen made great names, now forgotten. Genius has flashed like a meteor for a time, and soon died. Three generations of names are contained in those safes, and he indicated the rows of them around the office. 'All since I have sat at this table, in the same chair, with the same velvet cover, not yet worn out. There are many persons whose actions I have followed, and still follow, noting their lives. I piece the fragments together as a child does a puzzle. I think I know the hand that worked your ruin, and say, Wait.'

'I must and will clear my name,' cried Captain Gravenor with energy. 'Can you help me to do so?'

'You must remain in London.—How do you propose living?'

'The very subject on which I came to speak. Can you—will you, recommend me as an accountant?'

'Yes; I believe I can do that.—How do your finances stand?' asked Issachar confidentially. 'Can I lend you money?'

'Thank you for a kind offer, Mr Issachar. With my frugal habits I have sufficient for the present. Should it fail, I will come to you.'

'Agreed,' said the Jew. 'Wait. When affairs are ripe, you shall act. I was about to advertise for you, that you might be at hand when a certain event will assuredly come to pass, or I am much mistaken. It will clear your name from all blemish.'

'Do that, Mr Issachar, and I will kneel to you,' replied the Captain in a subdued voice, much overcome.

'No,' said the old man. 'I am only a poor human being, a descendant of a despised race. Perhaps in your case I may be an instrument in the hands of Providence.'

Very soon after this interview, Captain Gravenor, under an assumed name, set up as an accountant in a room near Broad Street, where he found employment, thanks to the recommendations of Issachar. He remained unknown and unrecognised, walking the London streets like a ghost returned to his former haunts, with a strange feeling that George Gravenor was another person from himself altogether. On Saturdays, his one great but melancholy pleasure was to take a return ticket to the seaside place where Felix was at school and watch the boy at play. Sometimes he had a sight of Lena, but this was seldom, as she was her father's companion during his convalescence, reading and writing for him untiringly. Neither she nor her boy knew whose eyes were upon them. Felix imagined his father to be dead. Young as he was, it seemed strange, he thought, that no one ever spoke of him; from an early age he had been checked when he ventured a question.

'I should like to have a photograph of my Papa,' he said one day to his mother. 'The other boys at school have them whether they are alive or dead.'

A look of positive fright passed over Lena's face, and she burst into tears. 'Never ask me that again, Felix,' she sobbed.

Once he ventured, also saying to Mr Desborough: 'Did my Papa go to Eton when he was a boy?'

'I do not know.'

'I wish he hadn't died.'

'You must look upon me as grandfather and father as well, Felix. Do not speak of him again.'

Youth is thoughtless. The boy had a vague impression of mystery—that was all. He never renewed the subject.

It was seven months since Mr Desborough had visited Nicholas Lane; he could walk pretty well now, and was anxious to resume his old habits. Mr Thorel had taken his place efficiently in the interim. He reported affairs at the bank to be perfectly satisfactory, and Mr Desborough's presence to be quite unnecessary.

One morning Mr Thorel drove across the Park from his house in Kensington Gore to Portland Place. Dressed in the height of fashion, with an exotic in his button-hole, he entered Mr Desborough's library, where Lena sat reading the *Times* to her father.

'I have come for the key of the strong-room,'

said he. 'Lord Harbury is coming this morning to Nicholas Lane for his jewels; his son is going to be married.'

'I will go with you,' said the banker. 'I shall be glad of an incentive to renew my duties.'

'But are you equal to it? Do you think if'—

'Quite, and I shall go,' said Mr Desborough. Rising, he opened his desk, taking out the master-key of the iron room at the bank, where plate, jewels, and securities were deposited—a key never out of his possession until his illness obliged him to intrust it to Mr Thorel in the course of business; but it was returned to him immediately.

His unexpected arrival at the bank was received with many congratulations from his numerous staff; and the old gentleman resumed his chair in the private room with unalloyed pleasure, awaiting the visit of Lord Harbury, who arrived at twelve o'clock.

Mr Desborough unlocked the strong-room door, then the iron safe containing Lord Harbury's family jewels, which were in an ebony casket. The nobleman pulled out its tiers of drawers to examine them. He held up a beautiful diamond necklace with a large opal pendant. 'This opal is considered the heirloom of my family; it is one of the finest in Europe. My future daughter-in-law will wear it on her bridal day.' At this moment one of the small diamonds surrounding it fell from the setting on to the table. 'Now, how does that come about?' said he. Adjusting his glasses, he closely inspected the jewel. 'The setting is damaged. How strange! Why—no—yes—impossible!' He looked up blankly at the banker.

'What is wrong? What is wrong?' cried Mr Desborough anxiously.

'Are you a judge of precious stones? If so, tell me if you call this an iridescent opal? There are greens and red in it, but no real fire. Mr Desborough, my opal has been changed!'

'My lord, that is impossible.'

'Take care what you assert, Lord Harbury,' said Mr Thorel in a menacing tone, a dark frown upon his face.

'How dare you dictate to me what I should say?' cried the nobleman in sudden anger. 'I swear that this is not an opal at all, nor even a first-rate imitation.—Desborough, how do you account for this?'

'The opal is as you brought it,' again interrupted Mr Thorel.

'I am bewildered,' exclaimed the banker.

'It is *not* as I brought it; this is a false one.'

'Then it was changed before you deposited it with us. Such things do happen in aristocratic families,' remarked Mr Thorel insolently.

'Not in mine, sir,' replied the nobleman haughtily. 'Besides, I took the precaution of having the jewels examined by Hancock on my way here—seven years ago, when Lady Harbury died. We will go to him now, if you please.'

The result was as Lord Harbury had detected: the opal had been stolen. This was a valueless counterfeit.

Poor Mr Desborough was much agitated. Once made public, this affair would damage his credit, and ruin him. 'We must go to Scotland Yard,' gasped he faintly.

'You are not fit, uncle ; I will go,' cried Mr Thorel. 'We will sift it to the bottom.'

'Let me take you home,' said Lord Harbury kindly. 'I am very sorry to cause you anxiety, and you only just recovering from an illness.'

'I do not value my life, my lord, but I do my honour. Who can have done this?' He was much shaken.

When he sat down in his study to think, after recovering from the first shock of the discovery, his energy returned to him in a remarkable manner ; always a clear-headed man, he took a sudden resolution. He wired for a celebrated detective to come at once. The result of their conference was a strong suspicion of one person.

'You must come with me to the bank immediately,' said the old gentleman. 'I cannot rest until the contents of the strong-room are thoroughly examined.'

FIRST NIGHTS OF FAMOUS PLAYS.

THE mental condition of every one assisting at the production of a new drama—audience, actors, or playwright—must always prove an interesting study. In the good old times, when the gallery was crowded with 'prentices from Cheapside, the boxes with 'persons of quality,' and the pit with celebrated wits, most plays were either 'troubled with convulsive fits, or died the first night,' says the author of the *Stage Beaux*—Tom Brown of Shiffnal—'or by mere dint of acting, held out to the third ; which is like a consumptive man's living by cordials, or else die a violent death, and are interred with the solemnity of cat-calls.'

In glancing back into the early part of the last century an advertisement will be found, published in the *Daily Courant*, announcing that Addison's new tragedy of *Cato* would be presented 'at the Theatre-royal, Drury Lane, on Tuesday, the 14th of April.' This was in 1713. The four first acts of the play, written nine years before, had been submitted to Colley Cibber, actor, author, and joint-manager of Drury Lane Theatre. Cibber's pleasure on reading the manuscript is reported to have been unbounded. But the manager's delight was nipped in the bud. 'Whatever spirit Mr Addison had shown in writing it, he doubted he would never have courage enough to let his *Cato* stand the censure of an English audience : that it had only been written for the amusement of his leisure hours in Italy, and was never intended for the stage.' But it was now an open secret that he had framed a tragedy ; and having been lately introduced to Pope—probably at Button's or the Kit Cat Club—Addison brought *Cato* with him in order to have his sincere opinion about it. 'I told him,' says Pope, 'that I thought that he had better not act it : that he would get reputation enough by only printing it. This I said as thinking the lines well written, but the piece not theatrical enough.' But the time came 'when those who affected to think liberty a danger, affected likewise to think that a stage-play might preserve it.' The forcible utterances touching liberty which this tragedy contained, it was thought, must rouse the people to a sense of the danger they suffered from the evil machinations of the Tories. The play was speedily

prepared for representation. For years no social event had excited more interest in society. Political circles looked forward to its effects with intense anxiety. A prologue was written by Pope, and a humorous epilogue by Dr Garth. The eventful evening arrived : the theatre presented an appearance of exceptional brilliancy—critics, poets, and playwrights : men of every political creed were in the pit. The boxes were filled : stars in the breasts of peers and diamonds on the necks of ladies dazzled the eye. The play began ; and in the excitement all criticism was forgotten. Cato's first speech in defence of freedom—

'Twill never be too late

To sue for chains, and own a conqueror.

Why should Rome fall a moment ere her time?

No ; let us draw her term of freedom out

In its full length, and spin it to the last ;

So shall we gain still one day's liberty :

And let me perish, but in Cato's judgment,

A day, an hour, of virtuous liberty

Is worth a whole eternity in bondage—

was greeted with loud applause from the Whig party on one side of the house, and echoed by plaudits not less boisterous from Tories on the other ; for the Tories had resolved to turn the tables on their opponents by a warm recognition of all that was uttered in favour of liberty. Throughout the five acts the applause never lagged. 'Yet not until the last sentence was spoken, and the curtain fairly dropped,' says Mrs Inchbald, 'did the author even venture to move.' Addison had placed himself on a bench in the greenroom, 'his body motionless, his soul in tumult, keeping by his side a friend, whom he despatched every minute towards the stage to bring him news of what was passing there.' The tragedy was acted for thirty nights. But it was never considered a good stage-play : its run was chiefly due to the political points of view from which it was regarded.

It was early in the year 1772, when Goldsmith was forty-four years of age, that he fell in with a friend at some old Fleet Street tavern, and begged his honest opinion as to the merits of the plot which he had conceived for a new comedy. The motive of the play, it was understood, turned upon 'one gentleman mistaking the house of another for an inn.' The critic pronounced the device too broad and farcical for comedy : upon hearing which Goldsmith exclaimed : 'It is all I can do ; for alas, I find that my genius, if I ever had any, has of late totally deserted me !' In order that he might be freer from interruption while engaged in writing this comedy, the author took lodgings in a farmhouse close to the village of Hyde, six miles from London. When he returned to town, Goldsmith submitted his play to George Colman ; but tedious weeks and months went by and no satisfactory answer came. The spring passed and brought him no hope. At last, early in the following year, he wrote Colman a pathetic letter. In answer to this appeal his manuscript was returned : it was accompanied, however, by a note stating that notwithstanding its faults the play would be produced. But no name had yet been given to the comedy. Joshua Reynolds suggested 'The Belle's Stratagem'—afterwards used by Mrs Cowley for one of her comedies ; another friend

considered 'The Old House a New Inn' more suitable. But the author finally selected *She Stoops to Conquer*; or, *the Mistakes of a Night*, as the most appropriate title. Garrick wrote a prologue for the play; and the 15th of March 1773—the date fixed for the first representation of this noted comedy—at last arrived. Goldsmith's friends, resolving to celebrate the day as became its importance, agreed to dine in company before visiting the playhouse. The poor dramatist was exceedingly nervous; neither the friendly sallies of Dr Johnson, encouraging words from Reynolds, nor the epigrams of Edmund Burke, could divert his thoughts. Dinner over, Goldsmith declined to accompany his friends: he resolved to absent himself from the theatre until the fate of the comedy was known. Meanwhile, the playhouse was filled by an expectant audience. At six o'clock the curtain rose, the prologue was spoken, and the play began. The house, quickly catching the humour of the scenes and the wit of the dialogue, warmed into hearty laughter. After the second act no doubt existed of the comedy's success. All eyes were turned upon Dr Johnson; 'and when he laughed, every body thought himself entitled to roar.' In fact, Tony Lumpkin's antics and Marlow's mistakes kept the house in excellent humour. All this while Goldsmith was wandering about moodily in St James's Park. Here a friend met him, and at last prevailed upon him to visit the theatre. The success of this comedy was doubly assured at the time from being witnessed on the tenth night of its production by George III.

When the newspapers announced the date fixed for the *School for Scandal*—'a play never before performed'—they made no mention of the author's name: the advertisements declared that the comedy 'would be ornamented with scenes which did honour to the painters, and furnished with dresses new and elegant.' In those days new dresses were the exception rather than the rule. The evening of the 8th of May 1777 was the date fixed for the first performance. The doors of Drury Lane playhouse opened at half-past five o'clock, and before an hour passed, 'a brilliant and crowded audience,' says the *Public Advertiser*, 'had assembled.' The curtain rising in due time, Garrick's prologue was given with much pleasantry. It adverted to the title of the comedy, and 'shot an arrow of pointed satire at the too general proneness to detraction observable in the daily and evening papers.' Then the comedy began. 'The loudest testimonies of applause,' remarked the *London Evening Post* on the day following, 'greeted the comedy between every act.' But the full force of enthusiasm was reserved for the screen scene, which produced a burst of applause 'beyond anything ever heard in a theatre.' A record of the sensation this scene caused is to be found in the *Life and Times of Frederick Reynolds* the dramatist. On this very night he was returning from Lincoln's Inn about nine o'clock; 'and passing through the pit passage from Vinegar Yard to Brydges Street,' he writes: 'I heard such a tremendous noise over my head that, fearing the theatre was proceeding to fall about it, I ran for my life; but found the next morning that the noise did not arise from the falling of the house, but from the falling of the screen in the fourth act, so violent and so tumultuous

were the applause and laughter.' Sheridan had gained the reputation that night of having written the most brilliant comedy in our language.

'What think you of a Newgate pastoral amongst the thieves?' Swift once remarked in Gay's presence. Gay was inclined to think a comedy having scenes laid in the famous prison might be better still. When he mentioned his idea to Swift, the doctor did not much like the project; and when the play was written, neither Swift nor Pope thought it would succeed. It was offered to Colley Cibber and his brother-managers at Drury Lane, and was promptly rejected. Gay then took it to John Rich, proprietor of Lincoln's Inn Fields Theatre. Rich accepted the play, and it was speedily put in rehearsal. The following announcement was printed in the *Daily Post* on the 29th of January 1728: 'Never before acted by the company of comedians at the Theatre-royal in Lincoln's Inn Fields. The present Monday, being the 29th day of January, will be performed the *Beggar's Opera*.' On the night of its first representation, Gay's many friends assembled at the old playhouse in the Fields. A vast crowd of 'women of quality and men of parts' was present. A ballad opera was a form of entertainment new to the public, and its success was assured before the curtain fell. The acclamations which rang through the house were said to have been deafening. For sixty-three consecutive nights the *Beggar's Opera* was performed that season. Nor was that all. It drove the Italian opera, which it burlesqued, out of town. Its songs were sung in every drawing-room, its verses printed on the fans of ladies of quality. In the character of the heroine, Polly Peachum, Miss Fenton gained both fame and fortune.

Edmund Kean's appearance shortly before his death in Grattan's play of *Ben Nazir* was one of the most anxious first nights ever witnessed. The incident has been placed on record in graphic style by the author himself. 'The night at length arrived,' writes Grattan. 'Everything was ready. I saw Kean in the morning: he expressed himself with the utmost confidence; strutted about his drawing-room in his lodgings in Duke Street, Adelphi, decked out in his magnificent dress; and declaimed with great vigour some of his favourite passages—the book in his hand. Notwithstanding all this, I had serious doubts of the night's result. I was certain he would be imperfect; but I reckoned fully on his giving the principal passages with ample effect; and I calculated on subsequent representations repairing any defects which might appear on the first.' Grattan then repaired to the theatre. He knew that Kean felt deeply the importance of ensuring success in *Ben Nazir*. He knew that a crisis had arrived in his professional fate. The whole tide of public feeling was with him. He had regained his place at the head of the acted drama. To confirm him there, beyond competition or cavil, there was only wanting one vigorous display of power in a new part, and that part was now ready written to his hand. Nothing, in short, could have exceeded the ardour with which he had undertaken the study of this play. He had carried it away with him on the provincial tour on which he had set out after playing his dozen nights in London to enthusiastic

audiences. He had repeatedly said that he hoped to reap as much fame from it as he had gained from Maturin's *Bertram*. The dress in which he was to appear was magnificent; an idea may be formed on that head from the fact that it cost fifty guineas. Kean reckoned on playing *Ben Nazir* a hundred nights. The house was crowded in all parts when Grattan took his seat in a private box behind the dress circle. A fair share of applause was given to some of the early passages; and the audience seemed well prepared for Kean's appearance, with which the third scene was to open. He did at length appear. The intention of the author and the keeping of the character required him to rush rapidly on the stage giving utterance to a burst of joyous soliloquy. 'What was my astonishment to see him, as the scene opened,' says Grattan, 'standing in the centre of the stage, his arms crossed, and his whole attitude one of thoughtful solemnity! His dress was splendid; and thunders of applause greeted him from all parts of the house. To display the one and give time for the other were the objects for which he stood fixed for several minutes and sacrificed the sense of the situation. He spoke; but what a speech! The one I wrote consisted of eight or nine lines: his was of two or three sentences, but not six consecutive words of the text. His look, his manner, his tone, were to me quite appalling; to any other observer they must have been incomprehensible. I was utterly shocked. And as the play went on and as he stood by, with moveless muscle and glazed eye, throughout the scene which should have been one of violent, perhaps too violent exertion, a cold shower of perspiration poured from my forehead, and I endured a revulsion of feeling which I cannot describe, and which I would not for worlds one eye had witnessed. The act closed—a dead silence followed the fall of the curtain.' The stage-manager came forward and made an apology for Kean's imperfection in his part and an appeal in behalf of the play. Neither excited much sympathy: the audience was disgusted. 'I now, for the first time during the night, went behind the scenes. On crossing the stage towards the greenroom I met Kean, supported by his servant and another person, going in the direction of his dressing-room. When he saw me he hung down his head and waved his hand and uttered some expressions of deep sorrow and even remorse. I bore my disappointment as well as I could; returned thanks to the other actors for their exertions, and renounced dramatic writing for ever.'

When Sheridan Knowles offered Charles Kemble the *Hunchback* for Covent Garden Theatre, it was immediately accepted. Fanny Kemble, then in her twentieth year, has recorded her first impressions of the comedy. 'After my riding lesson,' she writes, 'I went and sat in the library to hear Sheridan Knowles's play of the *Hunchback*. He read it himself to us. A real play, with real characters, individuals, human beings. It is a good deal after the fashion of our old playwrights, and does not disgrace its models. I was delighted with it; it is full of life and originality; a little long, but that's a trifle. I like the woman's part exceedingly, but am afraid I shall find it very difficult to act.' She was cast for Julia, her representation of which Knowles subsequently acknowledged far out-

stripped his most sanguine hopes. The author enacted the part of Master Walter. The play was produced on the 5th of April 1832. The crowded house which assembled to witness its performance was unanimous in its appreciation; and during the latter scenes, between Julia, Clifford, and Master Walter, 'the audience was overwhelmed with tears.' When the curtain fell, the *Morning Chronicle* states, 'the applause was tumultuous, and a general call made for Knowles. He was confused by the novelty of his situation, and exclaimed that, "conscious of his own unworthiness, he presumed that the audience was applauding their own kindness." The comedy ran to the close of the season, being only interrupted by a few benefit nights.

The famous play, the *Lady of Lyons*, was in rehearsal in the early part of 1838. On the evening of Thursday, February 15, it was announced for representation. Curiosity had been for some time excited regarding the power and brilliancy of this play, and the first representation was therefore attended by an unusually large audience. Men and women of rank and fashion filled the boxes. The curtain rose, and the play began amidst breathless interest. Macready, who took the part of Claude Melnotte, had never acted with greater force and energy; Miss Faucit (now Lady Martin) played with dignity and grace; and before the first act was finished, every one predicted that the drama would prove successful. Curiosity regarding the author was now rife: a thousand surmises were made as to his name. None seemed to recognise the work as Bulwer's. As the play went on the applause increased. Miss Faucit not merely won plaudits; she drew tears from the audience. 'Her first indication of changed feeling,' says the *Morning Chronicle*, 'from agony to rage, at the word *mother* addressed to the widow Melnotte, was an exquisite touch of genuine nature.' Meanwhile, Bulwer was not present to witness the triumph of his production; he was detained in the House of Commons by a debate on the ballot, in which he took part. The curtain had risen on the last act when he entered Lady Blessington's box. The audience was following the play with rapt attention; and finally, as the curtain fell, burst into a tumult of prolonged applause.

RANKEILOR'S DIAMOND.

By CARROL KING.

I was lying lazily in my hammock, which swung in the cool breeze, hung from a giant limb of one of the great trees in the compound. I was realising, somewhat uncomfortably, the condition of my finances, and forcing myself to look the situation squarely in the face. I was slow to believe that pleasure is a more costly thing than labour, and its products far from being as satisfactory. When I left England, I assured my father that five hundred a year and my pay would be more than enough to cover all reasonable wants and wishes; and now, after nine or ten months in Bareilly, I was so straitened 'for lack o' gear,' that I must either overdraw, borrow, or live an exceedingly retired life for the next three months. The privilege of playing guinea pool, in Ashton's rooms, with much better players than myself,

and the not very heavy book on half-a-dozen sporting events, had combined towards this rapid result, as I could not help ruefully acknowledging.

As I mused, I became suddenly aware of a laughing face looking down into my hammock. Rankeilor, the captain of my company, had swung himself noiselessly into the tree, and perched astride a rough limb that swayed alongside of mine. 'Well, Campbell,' was his gay greeting, 'you are enjoying the *dolce far niente* in the shade. I am just released from duty.'

'You are mistaken about the *dolce*,' I replied. 'I am tasting the bitter, not the "sweet do-nothing," and shall have to taste it for some time to come.'

'I have been a bit remorseful over you, lad,' he said, speaking more gravely than was his wont, and without looking at me, scraping down gray fragments of lichen from the trunk of the old tree. 'I have not forgotten that it was I who first introduced you into Ashton's rooms and to his fast set. I have been foolish enough myself; but I had no right to drag you into a like scrape.'

'Nonsense, Rankeilor!' I said hastily. 'I was just charging myself with moral supineness when you came upon me so suddenly—resolving to pull myself together, and resist even sixpenny Nap in future!'

He smiled his bright sunny smile. 'All right, lad. I'll back you up.—I am afraid I need not say what I came to say—to ask, rather. You could not lend me a tanner for two days?'

I shook my head regretfully. 'I am completely cleaned out, Rankeilor—not a rupee left. And, what is worse, Ashton holds one or two IOUs, which he must hold till next pay.'

'Ashton holds them,' he repeated, a quick impatient frown crossing his features. 'Then you positively have not a single coin to throw at a fellow, Campbell?'

'Not one, Rankeilor. I am awfully sorry; but—'

'Oh, never mind,' he interrupted, with ready kindness. 'I shall have plenty in a day or two, and may be able to give you a lift—who knows?' He reached up to the limb above, to steady himself for an elastic spring downwards.

'Hallo! What's come of your big rose diamond?' I asked, looking at the empty setting of the ring he always wore on the little finger of his left hand.

He, too, looked at the empty ring, and although he laughed, I saw that he had changed colour, and his laugh, to my ear, who knew all his moods, bore an inflection of pain or vexation.

'I—shall have it reset in two days at the furthest,' he answered. 'And I mean to make the setting more secure.' With a nod he sprang down, and vanished.

I wondered idly why he had shown some little confusion or annoyance at my question. The ring was a lady's ring—a large, exceedingly beautiful rose diamond, set between two opals. Of course he was bantered unsparingly about it by his brother-officers, and equally, of course, he retained his bright good-humour, and replied with ready wit, making none of them any the wiser regarding the donor of the ring. I alone knew that it was his mother's old engagement

ring, and that she had asked him to 'make it his talisman—his charm against evil.'

'It is time for your rope-drill, sir, and the men are turning out,' said Farrel's voice, breaking in on my thoughts.

I sprang down at once, casting a regretful look at the hammock that I left swinging in the cool shade of green boughs. I hated rope-drill, and the men hated it even more cordially than I did. It was an arrangement of ropes and knots whereby eight or ten men could be made to represent fifty or a hundred—by dint of hard work and much running about. However, the weather was not yet hot enough to make active exercise positively disagreeable; so we went at it with a will just inside the wall of the great compound, in the centre of which stood the officers' bungalow.

After we had finished and I had dismissed the men, who trotted away thankfully, wiping their hot brows, I threw myself down on the ground, hot and panting. Petersen, one of the men, had remained to gather up the ropes and convey them to their place. Suddenly he darted away from the ropes and dashed his cap at some object with all his force.

'What is it?' I asked, raising myself on my elbow with languid curiosity to watch his movements.

'It's a rabbit, sir! He's got into a hole here; but I'll have him for supper yet.' He began pulling away some light shrubs around the mouth of the hole or ditch into which the rabbit had disappeared. I lay down again heedlessly, to lounge away a few of the fifteen minutes that would intervene before the bell sounded for tiffin. Suddenly I heard the man calling me by name.

'Mr Campbell, sir, won't you please come here just for a moment?'

I jumped up, and went to the mouth of the hole, into which man and rabbit had both disappeared. Petersen was emerging from it feet foremost, dragging something after him.

'This is a queer place, sir,' he said: 'it goes in ever so far. It's a regular tunnel, it is; and I found them things inside!'

He held up a trowel and pickaxe—a very small one—both which bore evidence of having been recently used for excavating purposes in the half-dried, freshly-turned earth adhering to them.

'Where do you suppose it leads to?' I asked, taking the trowel in my hand.

'Well, sir, I didn't go in very far; but it goes off that way a good bit.' He described a sweep with his arm, passing the officers' quarters, to the left.

'And that leads?'—Only for an instant did I stand with bent brows; then, as if a 'brain-wave' had flashed from the one to the other, we both exclaimed at once: 'Good gracious! The fort!—the fort, with all the money!'

'It must be that,' I said, in consternation. 'Petersen, you go in again and penetrate to the very end. I shall walk above, as your voice directs.—Mind, you must shout well. We must look into this.'

The man obeyed at once, and crept back into the hole.

As soon as he had completely vanished, I

threw down the trowel, and prepared to follow above-ground, when a single dazzling point of light glittered like a star from amidst the displaced earth fallen from the trowel, where I had thrown it down. With a strange, sinking feeling of genuine dismay at my heart, I stooped, and picked up—Rankeilor's diamond! I had not time then, however, to speculate. Petersen was already shouting, his voice muffled and indistinct, as from a distance. I rolled the precious stone in a corner of my handkerchief, and sprang away to follow the man's progress. I replied to every shout by stamping violently on the ground. As we had feared, we were led directly to the 'fort,' where all the moneys of the garrison were packed and stacked from floor to ceiling. What was worse, before the faint muffled voice had ceased to lead me forward, I stood within two or three yards of the back wall of the fort! Evidently the tunnel was quite near completion: a single night's hard work, a brick or two removed from the wall, and the excavators would be richly rewarded!

I turned, and quickly retraced my steps to the mouth of the tunnel. A group of men, among whom I distinguished Captains Ashton and Fordyce, stood by the entrance. Plainly, they had been watching our movements, and must have thought them suspicious.

Obedying a swift impulse, I lifted my handkerchief and slipped the jewel into my mouth, where it lay 'rolled like a sweet morsel under my tongue.' I saw that Captain Fordyce held the trowel in his hand, and Captain Ashton had just laid down the pickaxe.

'Campbell! You, Campbell! It can't be possible!' exclaimed Ashton, in amazed crescendo. 'Who would have thought or believed it! I should sooner have named any other man in the garrison, had I been asked to pick out the—*the delinquent!*'

'The delinquent!' I repeated haughtily. 'How dare you use the word to me? I have been discovering a bold and daring attempt to rob the fort—an attempt that has come dangerously near to success too! Another night's work would have finished the!'

'What did I tell you, Fordyce?' interrupted Ashton, shaking his head. 'I told you, when we discovered this tunnel yesterday, and resolved to watch it, that the—the excavators would be sure to wear a bold front, and proclaim themselves explorers only!'

'I will not submit to this!' I cried with intense anger. I never was a patient man, and Ashton's half-compassionate, half-contemptuous tone drove me wild. 'You exceed your authority, Ashton! As for Petersen, he was obeying orders. I am going now straight to Colonel Pryor, to lay the whole infamous business before him. I think you will scarcely dare to say that that is the course of action a guilty man would follow!'

I turned sharply round to do as I said, when the men, coming upon me like an avalanche, seized and overpowered me in a moment, and with either arm in a powerful grip, I realised with speechless anger that quietness would serve my turn best, at least for the present. Both Ashton and Fordyce were my superiors in rank. I was comparatively a new-comer, while

they were veterans in the service. Even if this proved a mistake, their mistaken zeal would do them less harm than good in the colonel's eyes in so serious an affair as this.

'Escort Mr Campbell to his quarters, men,' said Ashton's quiet voice. 'Petersen can be taken to the guardroom for the present.—Fordyce, we had better go at once to Colonel Pryor.'

I was 'escorted' to my quarters by the obedient automatons on either side of me. Once fairly into my rooms, the first use I made of my privacy was to lock away Rankeilor's diamond in a secret drawer of my desk; and then, though chafing like an imprisoned eagle, I forced myself into quietness, in order to think out as best I could what relation Rankeilor bore to this strange discovery of the secret tunnel.

I had abundance of time to pursue my reflections, for, with the solitary exception of the orderly who brought my luncheon, no one came near me for several hours. Over and over, round and round again, spun and whirled in my brain the events of the day and my strange discovery. The conclusion I came to was startling; and the instant I found myself being driven towards it, like a horse swerving from a desperate leap, I turned away and began my summary all over again. One or two things I was quite sure of: Rankeilor's diamond had sparkled and scintillated on his finger last evening at the late mess dinner. Ashton and Fordyce had both declared that they had watched the tunnel since 'yesterday afternoon'; Rankeilor must therefore have lost the jewel in the tunnel while it was being watched, and at night, or very early in the morning. What could that possibly mean except?—I always stopped there, and began all over again. I remember, with a strange feeling of disloyalty to one who had been the kindest of friends to me, how Rankeilor had two or three times told me that he would have 'plenty of money' within a day or two at the furthest, and would even be able to help me out of my tight places. One thing I was clearly decided upon, in the slow crystallisation of repulsive ideas forming in my brain against my will—that was, that so far as I was concerned in the matter, I would shield my friend's name. I would preserve utter silence on the subject of his lost diamond, for the present at least, no matter what the penalty might be.

A quick footstep in the corridor caught my ear; my door was thrown open, and Rankeilor walked in, his face suffused with a fiery glow of indignation. 'What a thundering shame, Campbell!' was his impulsive salutation, holding out both hands to me. 'If Ashton and Fordyce knew you as I do, they would laugh at the thought of bringing such a charge against you!'

'As you do,' I said, forcing a smile. 'I mean—as *you* laugh at it!'

He looked at me attentively, as if something in my manner had struck him as unusual.

'Tell me all about it, Campbell,' he said, speaking with authority and kindness, both. 'Let me hear your version of the affair.'

'Mine is very simple. I was at my rope-drill, as the men can testify. I had dismissed the men, all but Petersen, whose duty it was to see to the ropes, when I saw him fling his cap at a rabbit

just darting into its hole, as we thought. Cap and rabbit both disappeared, and Petersen crawled in after, and found—what made him forget the rabbit. We had just finished exploring the tunnel; in fact, I have not yet had Petersen's report. Ashton and Fordyce, with one or two men, seized and arrested us, and scoffed at my explanations.'

Rankeilor looked grave.

'May I hear their account of it?' I asked after a pause.

'Yes. It seems that they discovered this tunnel yesterday, and without exploring it very thoroughly, suspected it might lead to the fort, and watched it, from that time and all night, by turns. No one approached it until the lunch-hour to-day, when they both—Ashton and Fordyce—saw you and your man near the entrance. Then, as they suppose, with a view to discovering how far the tunnel had yet to penetrate before reaching the fort, the man crept inside, and you walked towards the fort until within a few yards. Then they called up their men and arrested you both on the spot.—Is that correct, Campbell?'

Before I could reply, a knock at the door was followed by the entrance of an orderly, who informed me that Colonel Pryor desired my presence in the anteroom. I went at once, followed by Rankeilor. There were only two men—my accusers—present in the anteroom with Colonel Pryor when I entered. It was quite an informal inquiry; but I saw that the old 'chief' noted keenly my every word and look. I told the plain unvarnished tale, with simple directness, to Colonel Pryor, and he listened with courtesy. When I had ended, he looked towards Ashton and Fordyce.

'You found this tunnel yesterday afternoon, you say, gentlemen?'

'We did, sir, and we watched all night and all day; to-day, one or the other of us kept near it.'

The chief mused for a moment, his stern old face masked and inscrutable as that of the Sphinx. 'Did you leave any one on guard at the tunnel when you came to me first, to report? Who is there now?'

The two officers looked a little foolish.

'We did not post a sentry there after discovering the—tunnelers,' said Ashton, somewhat lamely. 'It will be time enough in the evening.'

'Well, gentlemen,' said the colonel in his short decisive manner, 'I do not see why Campbell should not have found out this tunnel as well as *you*, with intentions as innocent as your own.'

The officers were silent.

'It seems to me that you failed in your duty when you did not report such an important discovery to me last night. And it does not seem just to attach any stigma to Campbell's finding of it, unless you share it! If Campbell and his man had been the excavators, they would not have risked drawing attention to their work in broad daylight. I am greatly surprised at your finding no one there during the night, for certainly that tunnel was made in the hours of darkness! I shall post sentries there to-night. I think you had better confine yourselves to barracks till to-morrow afternoon—you three dis-

coverers, I mean—and let me deal alone with this henceforward.'

He left the room; and I never saw darker, angrier faces than were those of Ashton and Fordyce on hearing the colonel's ultimatum.

Without speaking to any of them, I returned to my own room, again followed by Rankeilor, who in his friendliest manner laid his hand on my shoulder.

'Campbell, old fellow, I don't mean to leave you alone till you make a clean breast of it! I see clearly that you suspect me of some complicity in this business, and I shall haunt you until you confess. Come, out with it.'

I gazed at him in bewildered fashion for an instant. Why should I be so anxious to shield this man's reputation, if he was himself so reckless of it? Or was this bold affectionate friendliness meant merely to draw out all my information and let him know where he stood? Well, he should have it! I would be reckless too, although the strong fascination of his look and manner, of the man altogether, had never been so strongly present to my mind as now.

'I don't suspect—I know, Rankeilor!' I said, looking earnestly at him. 'I found your diamond—where you lost it, in the very mouth of that tunnel, among the freshly-turned earth on the trowel!'

A series of rapid, startling changes crossed his features, leaving him as pale as death; but his eyes never flinched from their steady gaze into mine, only his hand dropped from my shoulder.

'You found my diamond there?—my mother's gift?' he said sternly.

'Yes; I found it there. I have it safely; and no eye has seen it but mine, nor shall any one hear of it from me, Rankeilor!'

His face softened again, and he replaced his hand on my shoulder with a smile. He had but opened his lips to speak, when a hideous sound, or rather a babel of sounds, arose from the opposite room in the same corridor: a rain of heavy blows, mingled with howls and loud protestations, and groans of—'Oh sahib! I *not* steal it! I *not* steal anything! Oh—oh, sahib!'

We both walked unceremoniously into Ashton's room, whence the sounds proceeded. It was not quite an unheard-of thing to find an officer beating his Hindu servant with his braces or anything that came handy; but Ashton was in a furious passion, and was kicking savagely as well. Without a moment's hesitation, Rankeilor sprang forward and wrenched the man's arm out of Ashton's angry grip.

'Go—run,' he said, and the poor wretch needed no second bidding.

Ashton turned fiercely on Rankeilor. 'How dare you interfere? The dog has been stealing! I have lost'—He stopped short, looking blacker than a thunder-cloud.

'I know,' said Rankeilor quietly. 'You have lost my rose diamond, which you took from me last night at baccarat, knowing well that it represented more than five times the value of the amount I owed you! Ashton, you shall send in your papers to-morrow! Fordyce too.—I have felt for some time that "monkeys" and "ponies" had gone quite far enough in your quarters; but when it comes to tunnelling through to the fort

for money to supply your table, it *must* stop! I give you your choice: either send in your papers at once, or the whole story of where the diamond was found—among the fresh earth adhering to the trowel—shall be told openly and freely.'

'Bah! Say no more!' said Ashton, with face and voice of exceeding disgust. 'I did not mean to stay long in any case in a corps of cads and tradesmen! I shall exchange into a horse-regiment.'

'You were glad enough to win the money of the cads and tradesmen,' said Rankeilor coldly. 'However, so long as you and Fordyce retire at once, you can go where you please.—Come along, Campbell.' He took me by the arm, and we crossed again into my room.

'Is it all square now, lad?' he asked, with his winning smile. 'And will you restore me my mother's diamond? You say you found it.'

'Rankeilor, I sincerely beg your pardon for having suspected you!' I held out my hand; and he grasped it warmly.

'It was natural,' he said; 'but I could not bear to tell you *how* I had lost my mother's beautiful gift; and until my next remittance from home, I knew I should not be able to redeem it. That was my reason for asking if you could lend me any money.'

'And I could not,' I said ruefully. 'But, Rankeilor, how can you be sure that Ashton and Fordyce are the defaulters?'

'I'll tell you how,' he answered readily. 'And if I am not mistaken, the chief guesses it as shrewdly as I do. When they reported the case, the colonel told them he would see to it, in a half-careless sort of fashion; but he asked them to wait there, in his house, until he performed an important duty. They did so with pleasure; and the old fellow, taking me along, went straight to the tunnel, and did exactly what you and your man Petersen, it seems, did. I crawled in; he walked above, and I guided him by shouting. He examined the pickaxe and trowel: the earth on them was fresh, quite different from that in the entrance. I am certain he believes, as I do, that that earth was turned over last night!—Campbell, my dear fellow, I forgive you with all my heart for suspecting me of—deuce knows what; but I refused utterly and indignantly to suspect *you* of the least approach to complicity in this—crime! Give me the full credit I deserve.' He laughed in his quiet cordial way; but I saw that he was a little hurt too. 'And let's "make a compact firm and sure" to help each other, and these young fledglings in our corps to escape from the snares of such fowlers as Ashton and Fordyce. Shall we?'

'I shall never play for money again while I live,' I said firmly. 'And I *don't* think I can ever distrust you again, Rankeilor.'

It was impossible for any one to guess whether Colonel Pryor suspected anything unusual in receiving the resignation of two officers on the same day. He could keep his own counsel—none better! The tunnel was safely blocked up, and the fort closely guarded. It was in 1860 that the incident occurred, and Rankeilor and I are still fast friends after thirty years. The snows of winter are beginning to besprinkle our heads, and our faces are tanned and weather-

beaten; but our hearts are fresh and firmly knit as in early manhood. His mother's diamond still shines on his finger, though she has long ago fallen asleep.

RAILWAY ENGINE-DRIVERS.

BEFORE a man can become an Engine-driver he has to serve some years in the locomotive works of the company, where he learns all the parts and fittings of an engine; he is then eligible for the post of fireman; at this rank he may remain a long time; in fact, he is fortunate if he is made a driver in the course of three or four years. It will therefore be seen that an engine-driver is always a competent man. This is a rule, and, like all such, there is generally an exception to it; but there is only one to this, and the circumstances of the case made it necessary that incompetent men should be employed; but the exception is hardly likely to take place again. The Midland drivers' strike in 1887 compelled the company to fall back upon men who had not sufficient experience; but risky though this was, no serious accident resulted from it. Drivers are skilled men, and therefore their number is limited. Many of them on the different lines of the country could supervise the building of an engine; and many of the locomotive superintendents have spent years on the footplate of an engine before they rose to their present high position.

A man on being appointed a driver will try his hand at first with a slow goods-train; and having shown himself competent and careful, he will then have charge of an express goods or slow passenger train; and the height of his ambition is generally attained when he is called upon to drive such trains as the Flying Scotchman, the Wild Irishman, or the Flying Dutchman. The general public has no idea what driving engines of these express trains means. It is no exaggeration to say that while the train is running the driver's whole life is in his work, and that he has no time to think of anything else but his engine and the signals ahead. An express train often travels at the rate of sixty miles an hour, and then signals will be passed about every four minutes, and it can readily be understood that an engine travelling at that high rate of speed will require constant attention. The strain on a man's mind working an engine a long distance without stopping is very great, and could not be endured for many hours together; besides, it would not be safe for an engine to travel more than one hundred and eighty miles without being examined, and that distance is about the maximum any engine runs on one journey. Two such journeys is a good day's work for both man and engine. The average time on duty for the men is nine hours a day, beyond which they are paid overtime. When they are not running, their time is devoted to examining the engine. This is a very important duty; for should any accident or delay be caused through negligence on the part of the driver in not seeing that the machinery is in good working order, he will

be severely fined, and probably reduced. This applies equally to the men in charge of goods and slow passenger trains; but as their speed is not high and they have constant stoppages, the liability of their engines getting out of order is not so great.

Engines are very much like racehorses—they have little tricks and peculiarities of their own, and require humouring; for this reason, every driver keeps to his own engine as much as possible. The express engines of most lines cost between three and four thousand pounds. Their working career depends very much upon the road they have to travel. Steep gradients play sad havoc with them, and will shorten their lives by two or three years. The speed of engines is regulated by time tables; but there is such a thing as making up lost time. This depends on the driver. If he is of a cautious and steady turn of mind, he will act up to the time table, and be late rather than travel beyond the authorised speed. There are many men, however, who delight in the speed of their engines, and who glory when they have the chance of a little fast running. This can only be indulged in when trains are late and a long distance has to be run without stopping. As the question is often asked, 'Which is the fastest train in the world?' it would be well to give it here with the particulars. The honour belongs to the Great Northern Railway Company. Their train which leaves Grantham at 4.18 P.M. and runs through to London (King's Cross) without stopping, arriving there at 6.15 P.M., is the fastest train in the world, covering a distance of 105½ miles in one hour fifty-seven minutes—averaging fifty-four miles an hour the entire distance. The speed of this train at certain places will exceed the rate of sixty miles an hour; but the passenger is unconscious of this unusual celerity, as the train oscillates very little.

Drivers have to stand all weathers, and with very little protection. In the summer they are sweltering in heat above and below; in winter the lower parts of their bodies are baked, and the upper parts are nearly frozen; but this they bear without much grumbling. The only weather they dread and do grumble at with just cause is the foggy and snowy weather; for to these two conditions of our climate can be debited the great majority of railway accidents. With all the care imaginable, drivers can never feel themselves safe in such weather till their work is done.

Behind the black and greasy faces of these men there are brave hearts, and seldom do they forget their duty to the public in times of accident. Nine times out of ten they could leap from their engine without much injury in cases of collision; but nine times out of ten they don't, but stick to their post till they know they can do no good. The recorded cases of their bravery, and the narrow escapes from accident owing to it, give a very poor idea of the actual number of such cases. Railway officials are never very communicative about an accident that all the world knows of, and they believe in the saying, 'Where ignorance is bliss, 'tis folly to be wise.' The public, therefore, are kept in ignorance of all but accomplished facts. But every year is adding to the safety of railway travelling; the splendid brakes

now in use on the more important lines have given even drivers and guards easy minds; and a thorough good system of fog-signalling would render their lives about as safe as that of the ordinary mechanic. Drivers and firemen are under a locomotive superintendent, and are only under the orders of other departments as far as the working of the trains is concerned. The large railways of England build their own engines and employ thousands of hands; these are all under the locomotive department. Crewe and Doncaster are the locomotive centres for the London and North-western and the Great Northern Railways respectively.

ACROSS THE SEAS.

HER foot falls faintly on the sand;
Her yearning heart would fain divine
What passes in that far-off land
Beyond the dim horizon's line.

A white wing flutters on the blue;
Her heart sways with the soft south breeze;
Ah! would she were a bird, and knew
To beat her way across the seas.

And to the vaulted heaven she lifts,
From alien shores, her dreamy eyes;
She follows where a white cloud drifts
Its northward way athwart the skies.

And will it meet the upward gaze
Of him whose thought is all for her?
And will he see it, in amazement,
And wonder why his soul should stir?

Or will his heart at once divine
That she has watched it far away—
That in its fragrant memories twine
Of love of him of yesterday?

Alas! alas! her eyes are wet
With foolish tears—the cloud above
Drifts by—eternal bonds are set
To human thought and human love.

And yet, who knows—it still may be
The moment hath its perfect part
In life, and speeds across the sea
To spend its sunshine in his heart.

MYRA.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.*

PRICE 1½d.

SIR WALTER RALEIGH'S BIRTHPLACE.

No county in all England can show such a glory-roll of famous sons as the brave shire of Devon, the pride of the 'West countree;' and amongst all the names which she has written upon the pages of history there is not a more notable one than that of Sir Walter Raleigh. Even in these dull prosaic days, whence chivalry has been driven by a thirst for self-aggrandisement, and wealth has banished honour, a glamour yet clings around the memory of that Devonshire Squire's son, who was at once a dashing soldier and a daring sailor, a polished courtier and a bold explorer, a planter of colonies and a merchant adventurer, a governor of provinces and a country gentleman, a graphic historian and a graceful poet.

It was in a modest unpretentious manor-house that the great Englishman first saw the light somewhere about 1552. Hayes Barton is now a cosy farmstead, presenting probably very much the same appearance in this year of grace as it did in the sixteenth-century days; standing in a sheltered valley some few miles inland from the little watering-place of Budleigh Salterton, and at no great distance from the ancient port of Exmouth. The house is a long low one, with quaint gables breaking the level of its thatched roof, and a bold two-storied porch standing out in the centre of its front. Although 'restored,' the classic features have been carefully preserved, and fancy easily repeoples the old house with phantoms of the past. The 'Hall,' now divided into two, but with its wide fireplace and its deep stone-mullioned windows yet perfect, is as trim as when Mistress Katherine, daughter of Sir Philip Champernown of Modbury, and widow of Otto Gilbert, lord of Compton Castle, ruled there as Walter Raleigh the Elder's third wife.

The room in which the future hero of the family was born is under the west wing gable, just at the head of a dark and winding stairway; and from its triple-light window there is a peep of rolling upland and great waving elms, and a little hollow where a brooklet sings and slides

amongst the water-flags. A real English home-stead, peaceful, and out of reach of the world's worry and racket, it is just the spot where a boy would grow up self-reliant, fond of sport, and develop a taste for the healthy simple life of a country gentleman. One can imagine the youngster wandering about these wide-stretching meadows, fishing the stream yonder, and hunting the game in his father's woods; and picture him, too, on Sundays and saints'-days going with his pious mother along the high-banked lanes to East Budleigh, in whose ancient church slept generations of his kin. The old family pew yet remains, bearing on its age-black panel the date 1537, cut in quaint rude figures; and in the aisle may still be seen the slab which covers the grave in which rests his father's first wife. The letters are curiously turned upside down, but otherwise the inscription reads correctly:

ANNAE RALEIGH Uxor WALTERI RALEIGH
Hujusmodi sepulchrum hujusmodi
ANNAE RALEIGH Uxor WALTERI RALEIGH

In the fine old church at Sidmouth, some six miles away, there is a relic, amongst a collection of registers and documents, which brings us into very close touch with the Walter Raleighs, father and son. It is a deed by which the manor of Sidmouth leases tithes of fish to 'Walter Rawlegh the elder, Carow Ralegh, and Walter Raleigh the younger;' and is of great interest not only on account of their signatures, but because it shows that each spelled the family name differently, in that delightfully free-and-easy way which folks had in those days of unfettered orthography. The father signs himself 'Ralegh,' the elder son as 'Caro Rawlegh,' whilst the future Sir Walter writes it 'Rauleygh' in this his first known autograph.

That the family was of gentle degree is proved by its alliances with the proud and ancient houses of the Gilberts, the Carews, and the Champernownes, as well as by the place-names of the surrounding manors of 'Collaton Rawleigh,' 'Withycombe Rawleigh,' and 'Combe Rawleigh.'

As to the master of Hayes Barton himself, little is known, except that he was already a Protestant when his son Walter was born, though his wife remained a Catholic for some years after. Katherine Raleigh visited Agnes Prest in Exeter jail and tried to show the error of her faith; but the heretic speedily turned the tables on her visitor; and Mrs Raleigh returning, told that she never 'heard any woman of such simplicity to see to, talk so godly and so earnestly, insomuch that if God were not with her, she could not speak such things.' Both parents, so their illustrious son tells us, lie side by side 'in Exeter Church.' Through his mother, young Walter Raleigh was related to the Gilberts; and at their ancestral home of Compton Castle, near Torquay, spent several years with his two half-brothers. A notable trio truly, each destined to win fame: Adrian Gilbert, organiser of grand schemes for colonisation, and dabbler in alchemy; Sir Humphrey Gilbert, the high-souled navigator, who will go down with his ship in a September gale off the Azores, bidding his men be not afraid, and crying, 'We are as near heaven by sea as by land;' Sir Walter Raleigh, the court darling, the foe of Spain, the discoverer of new lands over seas, who will face the headsman's axe as fearlessly as ever he fronted foeman's sword, and die calmly like an English gentleman, with but one request, 'Give me heartily your prayers.'

At some period in the early life of Walter Raleigh, Hayes Barton evidently passed into the Duke family, in whose keeping the following letter was long preserved:

MR DUKE—I wrote to Mr Prideaux to move yow touchinge the purchase of a farne sometime in my father's possession. I will most willingly give whatsoever in your conscience you shall deeme it worth; and if at any time you shall have occasion to use me, yow shall fynd me a thankful frind to yow and yours. I am resolved, if I cannot entreat yow, to build at Colliton. But for the naturall disposition I have to that place, being born in that house, I had rather seate myself there than anywhere els. So I take my leve readie to countervaille all your courtesies to the uttermost of my power. From the Court the xxvi of July 1584.—Your very willing frind in all shalbe able.

W. RALEGH.

Evidently, in the height of his splendour, Raleigh yet felt an affectionate longing for the old home of his race, although it would not seem that he succeeded in regaining possession of it.

The Colliton of the letter is probably the 'Collaton Rawleigh' before mentioned, where at one time his progenitors had property, and which still claims to be the place where the first potatoes brought to this country were planted by him.

Lingering in the cool porch, with its two stone benches and low archway, as the sun westerns fast and throws a golden light across the waving woods, through which the evening breeze is sighing like the wash of waves upon a distant pebble beach, pictures of the past come and go, hazy and indistinct by lapse of time, but with traces yet of colours which will never fade. Away beyond the crest of those upland meadows, right in front of the house, over which a cloud of rooks are wheeling homeward with hoarse 'Caw, caw,' lies the English Channel. Three

hundred years ago, a great sea-fight is raging on its tossing waters, which is to settle the fate of Merrie England, and decide whether the Bible or the Inquisition shall rule her people. The Invincible Armada, manned by the chivalry of Catholic Europe, and blessed by the Pope, is being gallantly tackled by the little English fleet, and stout west-country ships are clawing to windward and pounding away at the stately galleons of Spain. It is a battle for the gods, where cavaliers of Castile are fairly fronted by gentlemen of Devon, and Spanish Dons are at a death-grip with English seadogs. The roar of those Tudor guns has not even yet ceased to echo, and through the mists of centuries we can discern much of that glorious battle. Medina, with his fleet stretching crescent-wise, is pushing onward to join Parma, and then, ho! for London town; but Lord Howard of Effingham, with Drake, Raleigh, Hawkins, Frobisher, and a score of other valiant captains, are worrying him like a pack of hungry hounds. The Spaniards cannot shake them off, and are already crying to the saints for help; but the only answer is the cheering of English seamen and the crashing of round-shot into their great galliases; and ever as the Armada steers on up Channel, ships are dashing out from every port to join in the fell chase and strike hard for Queen and Freedom. So the great fight drifts out of sight of the villagers of Budleigh and Otterton and many another village round, who are gathered on the cliffs; and folks wonder how it all will end, until the glad news comes how a great gale has blown in the halls of heaven and scattered wide the pride of Spain.

To the son of Hayes Barton belongs, if the tale be true, the credit equally with Drake of having prevailed upon the Lord High Admiral not to lay his vessels alongside the enemy, but to harass and hamper him by a running attack.

Looking out westward from the little window of the porch, the dark ridge of Dartmoor standing out boldly against the rosy sky recalls Sir Walter Raleigh in all the magnificence of his power as Lord Warden of the Stannaries, and Vice-admiral of Cornwall and Devon, going up, according to right ancient custom, to the wind-swept granite tors to regulate the proceedings, and administer justice in all matters concerned with the tin miners and workers of the west. Then the picture merges rapidly into a more homely one, when, disgraced at court, he retires to his estate at Sherborne, and lives quietly with his wife, his 'deerest Besse,' and their boy Carew. But the calm does not last long; and even in this peaceful summer's evening, with a veritable Lotus Island spirit in the hay-scented air, it is easy to think how that energetic restless heart would weary of quiet country life, and throb wildly for new scenes of adventure; and the longing send him at last out to the mystic West, the land of the dying day.

And now the sun dipping behind these hills which guard Hayes Barton is suggestive of the waning of Raleigh's star. Queen Elizabeth is dead, and James Stuart has no love for the gallant west-countryman. 'On my soul, man, I have heard but *rawly* of thee,' is the elegant pun with which—so says tradition—the uncouth Scotchman greeted the polished courtier and

soldier-scholar. His trial at Winchester about the wretched Cobham and Arabella Stuart business will ever be a stain upon the fair escutcheon of the English Bar; and if ever a hiss from bystanders was richly merited it was when Popham the Lord Chief-justice called his noble prisoner 'a traitor and an atheist.'

It is a melancholy picture to see the once bold adventurer and queen's favourite courtier spending a dreary twelve years as a prisoner in the Tower, and whiling away the monotonous hours by writing his famous *History of the World*, though not in the 'White Tower' cell, so long pointed out as the place in which he was confined. A breath of freedom comes when he is liberated to set out for Guiana to discover gold; but from first to last the demon of ill-luck controlled the expedition; and little as he foresaw it, the result of this second voyage to Guiana was his death-doom. With a fleet of seven vessels, manned, so he himself wrote, by 'a company of volunteers who for the most part had neither seen the sea nor the wars, who, some forty gentlemen excepted, were the very scum of the world, drunkards, blasphemers, and such others, as their fathers, brothers, and friends thought it an exceeding good gain to be discharged of'—Sir Walter Raleigh reaches the Orinoco, so ill, that for twenty days he has tasted nothing more solid than a stewed prune. Disasters follow thick; and the crushing blow falls when news comes of the defeat of his men before the Spanish settlement of San Thomé, and the death of his son Walter.

The following letter, preserved amongst the Cecil papers at Hatfield, which the poor heart-broken knight wrote to Lady Raleigh, throws a pathetic light upon the sad picture of this adventure:

'I was loathe to write because I knewe not how to comforte you, and God knowes I never knewe what sorrow meant till nowe. All that I can say to you is that you must obey the will and providence of God. . . . Comfort your hart (dearest Besse); I shall sorrow for us bothe. I shall sorrowe the lesse because I have not longe to sorrowe because not longe to live. . . . The Lord blesse and comfort you that you may bear patientlie the death of your valiant sonne.—22d of March (1618), from the Isle of Christophers.—Yours,

W. RALEGH.

'(Postscript)—I protest before the majestee of God that as Sir Francis Drake and Sir John Hawkins died hart-broken when they failed of their enterprise, I could willingly doe the like, did I not contend against sorrowe for your sake in hope to provide somewhat for you and to comfort and relieve you. If I live to returne, resolve yourselfe that it is the care for you that hath strengthened my harte. My braynes are broken, and I cannot write much. I live yet, and I have told you why. Whitney, for whome I sold all my plate at Plymouth, and to whom I gave more credit and countenance than all the captains of my fleete, ran from me at the Grana-dos, and Woolaston with him. Soe I [have] nowe but five shippes, and one of those I have sent home my fly-boate, and in her a rabble of idle rascalls, which I knowe will not spare to wounde mee: but I care not. I am sure there is never a base slave in the fleete hath taken the paines and

care that I have done, hath slept so little and travelled soe much. My frends will not believe them; and for the rest, I care not. God in heaven bless you and strengthen your hart.—Yours,
W. RALEGH.'

His forebodings were too true; and when, on the 21st of June, he crept back with the remnant of the fleet into Plymouth, his enemies had been busy, and he was arrested by a despicable cousin, Sir Judas Stukely, and hurried to London to be sacrificed—such was the irony of fate—by his king, to please Spain, the very power from which Sir Walter Raleigh, years before, had helped to save the throne on which James Stuart sat.

In vain did Lady Raleigh plead for her great husband's life from a monarch who, four months before, had assured the Spanish ambassador that 'not all those who have given security for Raleigh can save him from the gallows;' and so, on Thursday evening, October the 28th, she bids him the long good-bye in the Gate House of the Tower, and leaves him for ever with a last brave smile. Then the famous prisoner takes up a pen and writes his farewell verses:

Even such is Time, that takes on trust
Our youth, our joys, our all we have,
And pays us but with earth and dust;
Who in the dark and silent grave,
When we have wandered all our ways,
Shuts up the story of our days:
But from this earth, this grave, this dust,
My God shall raise me up, I trust.

The sun has gone down now into the broad Atlantic, and the shades of evening are darkening the sweet Devonshire landscape; but the western heavens are a blaze of crimsoned purple, and the splendour of the dying day is typical of those last moments of Raleigh's life, which have left a golden glory about his memory for all time.

Let us pause a moment, and look upon a scene than which no finer or more ennobling has ever been played upon the great stage of History. In the dull gray hours of early morning, Sir Walter Raleigh comes out to meet death in the old Palace Yard. Sixty-seven stirring adventurous years have left their marks upon him; but he mounts the scaffold as cheerily as ever he did quarter-deck, and stands erect and smiling to take his farewell of life. The wild love of freedom flashes out in the very first words he utters: 'I thank God that He has sent me to die in the light, and not in darkness.' All his old courtliness shows itself as he gently dismisses the friends who have gathered round him, saying: 'I have a long journey to go, therefore I must take my leave of you.' The fearlessness of his nature asserts itself as he tosses off his doublet and asks to see the axe with: 'I prithee, let me see it! Dost think that I am afraid of it?' And the bold faith of the man shines forth in his answer to the sheriff's question as to which way he will lay himself upon the block: 'So the heart be right, it matters not which way the head lies.'

The grim executioner even is touched by his victim's fortitude, and weepingly kneels and asks forgiveness. This done, Sir Walter Raleigh places himself with his face to the east, prays silently for a brief space, and then gives the fatal signal by raising his hand. Utterly unmoved, the headsman stands irresolute, and the voice which has rung out in the crash of battle and sounded

clear above the howling gale is heard to cry: 'What dost thou fear? Strike, man, strike.' Then the axe is wielded once, twice; but or ever the second blow falls, the staunch heart has ceased to beat, and one of the most illustrious of Englishmen is no more.

It is very much the fashion nowadays to cry down the worthies of the past, to dwarf their virtues, and magnify their faults; nor has Raleigh escaped. True, he was not altogether an admirable character—was vain, extravagant, overbearing, and ambitious; but with it all he was a brave, hard-working, talented, God-fearing man; and will be ever remembered as one of that band of Elizabethan heroes who helped so largely to make our country great.

DUMARESQ'S DAUGHTER.

CHAPTER XLII.—THE MEETING.

FOR the next three days, the same unnatural peace of soul possessed Psyche. Sirena and Geraldine Maitland, who were constantly in attendance, could hardly understand her strange unvarying calmness. But Haviland Dumaresq, nearer to her in blood, and liker in fibre, understood it only too well. Psychologist that he was, he knew what it meant: a self annihilated.

When a soul is dead, it doesn't complain; it doesn't grieve; it doesn't even despair. It lives on with a vague sort of vegetative life; a life which stands to the psychical health in the same relation as the state of coma stands to the bodily functions. That was indeed the sort of life that Psyche was now fast falling into.

On the third morning after the final collapse, Sirena received a telegram from her sister, dated from Constantine: 'Sir Austen better, and able to travel. We are all coming on together at once. We shall reach Algiers by to-night's train. Come in with a carriage from the Orangers to the dépôt to meet us.'

She showed the telegram in much doubt to Dumaresq. How to comport themselves? The old man turned it over in his mind for a moment. 'Shall we let her know they're coming or not?' he asked, hesitating. 'Either way, Sirena, seems fraught with alternative danger.'

'Let her know,' Sirena answered with American boldness and feminine instinct. 'Say to her Corona and Cyrus are coming. She'll be anxious to know whatever they can tell her. You needn't mention that Sir Austen's with them.'

'But suppose she should want to go down and meet them?' Haviland Dumaresq suggested. The events of the last twelve months had so thoroughly unmanned him that that proud spirit condescended even, for the first time in life, to ask somebody else's advice about his own movements.

'Let her go,' Sirena answered after a second's consideration. 'It'll do her good, Mr Dumaresq, even to move. Anything that sort of takes her out of herself is good for her, I opine. She'll want to hear what Sir Austen has to say. And if she sees him, it'll satisfy her to learn the

worst at once. After all, Sir Austen was the last man to see him.'

'I can't bear to tell her,' Haviland Dumaresq cried, recoiling. 'Will you, Sirena?'

With a nod Sirena slipped from the room to Psyche. She told her the message very gently. Psyche, sitting by the open window, where the sun shone warm on her face, and the insects hummed, and the scent of the great white Japanese lilies floated in upon the breeze, listened with that strange dull calmness still all unbroken. 'We'll go to meet them,' she said simply, folding her hands on her lap in Quaker fashion. 'I can bear all now. I can bear anything. Do you know, Sirena, I felt almost happy in the warm bright sunlight just this minute—happy like a lizard—before you came into the room to tell me. The light fell upon me till I felt it with my face; and it seemed as if the world were all dead to me at once; and my eyes were gone; and my senses were failing: and just the sunlight and the breeze and the flowers remained, and the noise of insects, and the vague sense that, after all, he wasn't now so very, very far from me. He was farther away, you know, before we knew all. And now, I think, he knows all too—and perhaps he forgives me.'

'You must rouse yourself,' Sirena cried with a face all tears. 'Oh Psyche, you must really try to rouse yourself. You mustn't let your life just dream itself away and fade out like that. For your father's sake, dear Psyche, you must try to rouse yourself.'

'I can't,' Psyche answered, moving her sightless eyes quietly round in the broad sunshine. 'I don't seem to have impulse enough left now for anything but this. I like to feel the sun fall full upon my eyes. I can feel it hot, oh, so hot on my eyeballs. I'm quite resigned, quite resigned now, Sirena; and I feel somehow that if I were to try and rouse myself, the pang in my heart would come back at once as fierce and cruel and painful as ever. It would come like a spasm, and cut through and through me.'

'But you'll go down to meet Cyrus?' Sirena cried with a despairing look.

'Oh yes, I'll go down to meet Corona and your brother,' Psyche answered with a quiet half-inaudible sigh. 'I couldn't bear not to go down and meet them. I want to hear the worst at once, Sirena. I think when I've heard it, dear, it'll be all over. And besides, I want to thank them both so much for the trouble they've taken.' And she kissed her new friend's hand softly and tenderly.

At six o'clock that night, they were at Algiers station; Haviland Dumaresq and Sirena supporting and guiding the blind girl's steps; and Psyche, pale but resolute still, walking firm with unflinching feet between them. After all, she was still Dumaresq's daughter. Though eyes and nerves might desert her at a pinch, that unconquerable will should never fail to sustain her.

At ten minutes past six, the train steamed, snorting, into the bare station. As it came, Psyche's heart sank slowly within her. She knew not why, but a faint fluttering possessed her soul. She remembered that fluttering well of yore: how strange! how unexpected! She had felt it more than once—in her happy time—in the old, old days—that summer at Petherton.

She hardly knew herself what the fluttering foreboded.

The train pulled up at the platform in front. Haviland Dumaresq, too agitated in soul to know what he was doing, left Psyche for the moment in Sirena's care, and rushed forward along the line in search of Cyrus and Corona. Sirena drew Psyche gently along, and stopped at last in front of a full carriage, whence two or three people were descending deliberately with true African laziness among their rugs and bundles. Corona's grave face gazed out at her ruthfully in the background behind, and Cyrus stood beside her, looking very solemn.

'Take care, Sir Austen,' Corona whispered under her breath. 'Perhaps you'd better not get out just yet. My sister's there, and I—I fancy she's got a friend of hers with her. She's very much agitated. I don't want you to get out too soon and shock her.'

'Shock her?' Sir Austen answered in genuine surprise. 'Why, what do you mean, Miss Vanrenen? I'm wasted, I know; but I don't quite understand what there is about my appearance'—

But Cyrus would permit him to say no more. 'Not just now,' he interposed in an authoritative voice. 'We'll explain by-and-by. Let my sister get out first, and then I'll come myself. —Good-evening, Sirena. —Good-evening, Miss Dumaresq.'

At that name, Sir Austen gave a sudden start of astonishment. 'Miss Dumaresq!' he repeated with extreme incredulity. 'Not—not Miss Dumaresq, Haviland Dumaresq's daughter?'

As he spoke in a voice loud enough to be heard outside the carriage, Sirena started back with alarm to see Psyche's face, pale as death before, grow suddenly crimson, while a terrible thrill passed visibly like a wave through her whole body. Corona was pausing on the step now; and Cyrus, with one hand outstretched in a warning attitude above his shoulder, was endeavouring to prevent Sir Austen from descending. But Sir Austen, undeterred by his vain remonstrance, burst wildly to the door with incredible strength, for a man just recovered from the fierce throes of fever, and crying aloud in his paroxysm, 'It's she! It's Psyche!' rushed frantically out upon the open platform.

Next moment, to Sirena and Corona's unspeakable astonishment, Psyche herself, rushing forward with equal ardour to meet him, lay fainting and sobbing in Sir Austen's arms, in one fierce torrent of outpouring emotion.

For a full minute she lay there still, panting hard for breath, and now once more deadly pale in the face, with the awful pallor of a broken heart—too suddenly relieved from an unbearable pressure. Sirena and Corona, taking it all dimly in, but not even now understanding to the full what it really meant, stood reverently by, endeavouring to shade them with their screening bodies from the prying eyes of the other passengers, and too agitated themselves to make any effort at calming the agitation of those two weak and overwrought lovers.

At last Haviland Dumaresq, having walked in vain to the train's end, without recognising anybody, turned back in his quest, and came suddenly face to face with the unconscious couple.

Corona noticed, even in that moment of hurry, excitement, and surprise, that as soon as his eyes fell upon Sir Austen, a strange gleam of joy, not unminged with an expression of incredulous astonishment, lighted up the old philosopher's cold and clear-cut features. He advanced, all trembling, with outstretched hand. 'Why, Linnell!' he cried, in a voice half choked with its own delight. 'You back! You safe! They said you were dead! This is wonderful, wonderful! They told us it was the other one!'

'What! it isn't Sir Austen after all, then,' Cyrus cried, half piqued to think he hadn't really been hob-nobbing these last three days with a genuine unadulterated English baronet.

'No, no,' Dumaresq answered, still grasping the painter's hand hard in his trembling fingers. 'It isn't Sir Austen at all, thank God; it's his cousin, his cousin!'

Linnell turned round, with poor Psyche half fainting still, and supported on his arm. 'Yes,' he said quietly, with a deep sigh of regret. 'It is Sir Austen—I'm Sir Austen now: my cousin lies dead in the desert behind me.'

Corona and Sirena stood off, all agast. Then Cyrus's chance was gone for ever; and Psyche would yet be a real My Lady!

After all, it would be something to talk about in Cincinnati: 'Our friend Lady Linnell, who was once Miss Dumaresq.' And only to think they'd be able to call a real My Lady by her given name, Psyche!

For if there is any being alive on this oblate spheroid of ours who thoroughly appreciates at its fullest value the social importance of rank and title and 'our old nobility,' that being's home is by the setting sun, and his land is surely the great western Republic.

But Psyche only knew that HE had come back again.

(To be continued.)

THE TOMATO.

THE Tomato, the 'Love-apple' of our forefathers, has now become one of our most important vegetable products. At this season, when the annual crop has just been gathered, a short sketch of its history and manner of culture may be interesting.

Though almost unknown in this country ten years ago, except to those directly interested in horticultural affairs, the plant is not by any means a recent introduction, as we find that it was first grown in Britain as far back as the year 1596. It is a native of Central and South America, and was brought to Europe by the Spaniards in 1583. Its fruits were used by them and the Italians in the composition of sauces and salads, being for that purpose dressed with pepper, salt, and oil. Though introduced to British gardens as early as 1596, it seems to have been little more than an object of curiosity and ornament, on account of the unique beauty of its fruit, till the beginning of the present century, when we learn from the writings of a horticulturist of that time that 'of late years the tomato has come into great use for culinary purposes, and is become an object of cultivation for the market of the metropolis.'

In connection with the history of the tomato, it is interesting to note that its first appearance in Britain was made in the year previous to that in which the potato—a native also of South America, and a member likewise of the *Solanum* family—was introduced; yet how great is the difference in the estimation in which each has been held, and their economic value! The potato has long been a necessity of life with us; while the tomato, though rapidly rising in popularity and commercial value, is still almost unknown to the mass of the people. However, during the last decade the luscious fruits of the tomato have risen in public estimation to a surprising extent, and it is now a very important item in our national food supplies. The taste for it is steadily increasing, and the salesmen in our large fruit-markets agree that no garden produce meets with so ready sale.

Tomato-fruits eaten as they are plucked from the plants are delightfully cool and pleasing to the palate of those who have acquired a taste for them, and no other fruit or vegetable is capable of being cooked and served in so many attractive forms. They may be boiled, fried, baked, roasted, stewed, pickled, or preserved, and made up into sauces, soups, ketchup, and salads in a thousand-and-one ways to tempt the appetite. In a recently published book before us there are sixteen pages of short recipes for preparing the tomato, and these are only the author's selection from the many ways in which it is possible to prepare it for the table.

We have said that the tomato has rapidly increased in commercial value during the last few years. This will be easily realised if we consider the large number of glass structures in the country employed in its culture alone. We have the authority of an eminent horticulturist for the statement that there are at the present time no fewer than one million square feet of glass structures in Great Britain under which tomatoes are grown for market purposes. It is of course difficult to arrive at anything like an exact knowledge of the total weight of the fruits raised in these houses. In the case of the supplies which are sent from the Channel Islands, whence we get very large quantities all the year round, the information on this matter is somewhat definite. Last year (1890) eight hundred tons of tomatoes of the value of forty thousand pounds were shipped from these islands to various ports in the kingdom. Of this quantity, by far the largest part went to London, though Liverpool, Glasgow, Hull, and Newcastle also received considerable consignments. The natives of the Channel Islands have found the tomato a splendid source of wealth, of which they have not been slow to take advantage. They give the greatest care to the production of the fruits, selecting the varieties they grow with much thought and after many trials. Their climate is congenial to the tomato; but they have some heavy drawbacks to contend against. All their produce must be shipped off by steamers, and consequently it requires to be more carefully packed than in the case of consignments forwarded by rail. But they have surmounted this difficulty, and succeed in packing tomatoes, grapes, and other soft fruits so that they arrive at their destination in almost perfect condition. Their

mode of packing tomatoes, though effective, is very simple. They use light yet strong wicker-baskets which hold from twenty to thirty pounds each. The bottoms, sides, and ends of these baskets are covered with large sheets of paper, and then the fruits are put carefully in until the baskets are nearly full to the rim. One or two sheets of strong paper are then placed over the top and laced firmly with twine, and the basket is ready for shipment.

The Azores and Canary Islands also send large lots to London. From the north of France also come considerable quantities, which are nicely packed with fancy-coloured paper shavings. This manner of packing helps to attract buyers to the lots, and enhances their value.

For one or two seasons, small quantities have come from the United States, where the tomato is more extensively grown than in any other country in the world. The distance, however, is against this trade, as the fruit is of a very perishable nature.

Foreign and even Channel Island tomatoes, however, are never so fine as home-grown produce. They lack the perfection of finish, colour, flavour, and beauty which makes our home-grown fruits so delicious. This is caused by their being pulled before they are fully developed in size and colour, and the longer time that necessarily elapses between the acts of plucking and consuming.

Worthing, in Sussex, is the centre of the home tomato-growing industry, and a large part of the best fruits offered in the London and other central markets is raised there. The trade gives employment to many hands; and in recent years, numerous and valuable greenhouses have been erected for the culture of the tomato.

In other parts round London, in the midland and northern parts of England, and in Scotland, tomato-growing is rapidly extending, and, as a rule, those who have engaged in the occupation have found it profitable.

The tomato in this country is almost entirely grown under glass. There are a few attempts made each season to raise a crop out of doors; but except in very bright long summers, these efforts have been followed with very little success. Under glass it is comparatively easy to manage, very little gardening skill being required to produce good crops. The principal rules followed by successful growers are—to keep a moderately dry atmosphere in the house, to provide good ventilation, and to allow the plants very little nourishment or moisture until after the fruits are well set. The plants being annuals, require to be raised from seed every season. The seed is sown in March, and the plants are grown in pots or boxes in a good strong heat till May, when they are planted in the fruiting-beds. As they grow up, stout stakes are placed to them.

The one-stem mode of culture is now generally adopted. This is effected by pinching off all shoots that are thrown out from the main stem, which treatment induces the plants to produce a greater number of blossoms, and prevents them running too much to foliage. The fruits which are most suitable for marketing purposes are of medium size, about a quarter of a pound in weight, with smooth clear skin, round form, and warm red colour.

The varieties of the tomato are now very numerous; indeed, no other kind of fruit or vegetable exhibits such variableness in the forms of its fruit. There are large, round, smooth-fruited sorts of a beautiful scarlet colour when ripe; kinds which produce rich golden-coloured fruits; delicious plum and cherry-shaped sorts; currant-like varieties producing clusters of small pretty fruits; and there are kinds which give fruits with the soft skin, shape, and colour of the peach.

A representative collection of these varieties in healthy vigour, well and skilfully grown, each tree with many fine ripe luscious love-apples hanging amidst clean fresh foliage, is a grand sight.

There can be no doubt of the future importance of the tomato in this country as an article of diet. We believe that soon its only rival in the Vegetable Kingdom will be the potato; and if horticulturists, by the cross-fertilisation of suitable sorts, succeed in raising a variety that will be sufficiently hardy to give good crops when grown out of doors, the tomato, as in the United States, may become as popular with us as the potato.

A NOBLE REVENGE.

PART IV.—CONCLUSION.

CAPTAIN GRAVENOR had not worked many months as an accountant, when one day he was hastily summoned to Providence Court; and for the first time within his remembrance, found the office empty—no fire in the grate, the money-lender's chair vacant. He was shocked to hear that his one friend was no more. The young clerk had found Mr Issachar dozing, as he imagined; but in reality he was dead, having passed away peacefully in his sleep.

Sincerely grieved, Gravenor ascended to an upper room, where the old Jew lay calm and tranquil on his bed. He took the thin wrinkled hand in his own. Was it fancy, or did those cold fingers indeed clasp his? He thought so. Bending over him, he silently thanked the inanimate clay—of the man who had believed in his innocence.

The money-lender had many friends, who were also on the spot, taking the arrangement of his funeral. Some of these were executors. He left a large fortune. There were bequests to several hospitals, legacies to friends and to poor Jews. To the astonishment of Captain Gravenor, a codicil to the will named him as successor to the business, bequeathing him mortgages, securities, and all the property upon which he had lent money—a fortune in themselves. Upon examination, the Captain found that not only had Issachar advanced large sums on important bonds, foreign as well as English, but on jewels and ancient plate. There were gold and silver salvers and goblets of Benvenuto Cellini. One large packet was directed to himself. It consisted of deeds; and in a small case was a magnificent opal. On a slip of paper, Issachar had written: 'Herein you will find several important papers—all forgeries. I knew them to be such when I

received them—for they will arm you with the means of extinguishing the career of the wretch who ruined you—Jaques Thorel—at a blow. He also brought this fine opal. Whose it really is, time will show.' The date was nearly six months previous—soon after Mr Desborough's seizure.

Captain Gravenor soon decided how to act. He desired Mr Everett, the Jew's solicitor, and whom he retained as his own, to write both to Mr Desborough and Thorel, making an appointment to meet them on urgent business the following morning at the bank in Nicholas Lane. By a strange coincidence, it was only the day after the banker had searched through the contents of his strong-room in the presence of the detective. To Mr Desborough's intense relief, he had found the property deposited with him to be intact, as far as he could judge; but his papers had been disturbed; precise and neat in his business arrangements, he discovered that at once.

At the appointed hour, both the banker and Thorel were awaiting the solicitor, both concluding that his visit was connected with the stolen opal. Presently, Gravenor and Mr Everett arrived, having posted a strong detachment of police in plain clothes around the entrance.

'Captain Gravenor and Mr Everett,' announced a clerk, opening the door of Mr Desborough's private room.

A bomb-shell falling in their midst could not have caused greater consternation. The banker started to his feet; but the usually self-assured Thorel staggered to a chair and fell into it.

Seven months of rest had somewhat restored Captain Gravenor to a semblance of his former self. He was less thin; the dark sun-burnt skin had disappeared; his eyes were brighter, his hair gray; a dignified bearing taking the place of his early debonaire joyous manner. He looked taller than ever in his suit of mourning. Entering the room a few paces, he stood still, regarding the two men before him. Mr Everett turned the key in the lock and placed his back against the door.

'George Gravenor! Come back!' gasped the old gentleman.

Thorel glared at him with a murderous glance, but did not speak.

'Yes, Mr Desborough,' replied he, in a serious deliberate voice. 'I have returned to clear my honour and claim my wife.—Do you know these securities?'

'Good heavens!' cried the banker, taking them with a shaking hand. 'Yes; I recognise them. But I saw them only yesterday in my safe. How did you obtain them?'

'These are forgeries, upon which yonder ingenious villain raised a large sum of money from the late Mr Issachar. See! Here is his receipt for it, signed—'Jaques Thorel. He who could forge one thing could counterfeit another. It was he who forged your cheque to ruin me.'

'It is false—convict!' cried Thorel, suddenly making a dash across the room and seizing Gravenor by the throat. But he was no match for the Captain, who, after a short scuffle, shook him off, then held him by the collar at arm's-length.

'Go to yonder table and write a full confession of your guilt, and betraying an innocent man through jealousy—to a fate worse than death.

Outside the bank there are police to arrest you. Write, I say, at once.'

'Jaques, you are a villain! I am convinced you have purloined Lord Harbury's opal,' said the banker.

'Opal—opal!' exclaimed Captain Gravenor, producing a small box. 'Can this be it?'

'Gravenor, I curse you!' hissed Thorel. 'You have stood between me and the woman I loved. I am sorry I did not remove you from my path by surer means.—Yes, uncle, I did forge your cheque; I confess it, and glory in having given him a few years of suffering. I wish'—

'Stop!' said Mr Desborough, horrified. 'Say no more. Write the full confession. I demand it.'

Thorel took a pen, dipped it in the ink, and, with great self-command, wrote a few lines.

Mr Desborough took the opal, the splendid jewel, bright with its hidden fire. 'A forger, a robber.—Jaques Thorel, I disown you. No punishment will be too severe for you.—Give him up to justice, Gravenor.'

'Will punishment, however severe, restore to me the years I have lost—give me back the companionship of my wife—the happiness of seeing my boy grow up from infancy—will it restore my desolated home?—Thorel, you have injured me as much as one man can injure another; but it would render me no satisfaction to know you were leading a life of hard labour, enduring the degrading companionship of the hulks! No. I destroy these proofs of your guilt for ever!' said Gravenor, tearing the forged papers, the signed acceptances, and casting them on the fire. 'Go!' he said, pointing to the door. 'The world is open to you—to which will be published your odious infamous secret. Let that knowledge and your guilty conscience be my revenge.—Go, and repent—with a soiled name, a ruined reputation, as you gave me.'

For the first time in his life, the pale face of the wretch crimsoned. He opened his lips, as if to speak; but no words came. Then, overcome with shame, his head sank, and he slouched from the room, his self-assurance, his jauntiness, gone, destroyed by the coals of fire heaped upon his head.

'Captain Gravenor,' said the banker, grasping his hand, while tears coursed down his furrowed cheeks, 'you are a noble, generous man! How I have misjudged you!'

'Not so, Mr Desborough. I try to be a Christian, nothing more.'

'From this moment, the bank shall be that of Desborough and Gravenor.—Will you be my partner?'

'Yes,' answered the Captain, clasping his father-in-law's hand.

Thorel's confession was published in all the leading papers both at home and abroad. Former friends flocked around Captain Gravenor with their congratulations; but, though glad to see again their once familiar faces, he remembered that he had stood alone in his adversity. To one man alone he owed gratitude, who had believed in him, and saved him.

His honour is cleared; and if ever perfect happiness existed in this world, it is to be found in the home of George and Lena Gravenor. With the love of his wife and boy, the Captain is

slowly forgetting the years of trial he had endured; they have left their mark upon him, but only to elevate his character, rendering him a noble Christian man.

EXPULSIONS FROM PARLIAMENT.

A RECENT expulsion from the House of Commons recalls a power of Parliament which, although nowadays seldom put into force, has in the past been often exercised under singular circumstances against members. Many expulsions for commercial and other frauds took place in the early part of the eighteenth century. After the bursting of the South Sea Bubble, several leading members who had been identified with it were expelled from Parliament. The Chancellor of the Exchequer, Aislalie, was one of these. He was said to have made a quarter of a million by transactions in the stock of the company, contrary to his oath of office. Aislalie was expelled without a division, sent to the Tower, and ordered to refund his ill-gotten gains. A similar fate befell Sir George Caswell, a wealthy banker of the day. On the 23d of January 1721 the Commons, having ordered their doors to be locked and the keys to be laid on the table, summoned Sir Robert Chaplin, Bart.; Sir Theodore Jannsen, Bart.; Mr F. Eyles, and Mr Sawbridge, directors of the South Sea Company, to attend in their places immediately. General Ross then acquainted the House—according to the records of the period—that 'they had already discovered a train of the deepest villainy and fraud that ever hell contrived to ruin a nation.' It was at once agreed *nem con.* that Sawbridge and Jannsen be expelled the House. A few days later, a like resolution was agreed to with respect to Chaplin and Eyles. In 1723 Lord Barrington, an Irish peer, was expelled for promoting, abetting, and carrying on a fraudulent undertaking called the Harburg Lottery. In 1730 Sir Robert Sutton and two other members were dismissed for participating in the direction of a shady concern called 'The Charitable Corporation.' One member, a Mr Ward, was in 1727 prosecuted by the Duchess of Buckingham for forgery. Being convicted, he was expelled, and ordered to stand in the pillory, where he had his footmen in livery to attend him. He is referred to in Pope's line in the *Dunciad*: 'As thick as eggs at Ward in pillory.'

A Mr Asgill was expelled in 1707 for having published a treatise on *The Possibility of avoiding Death*. The same fate on the same ground had previously befallen him in the Irish Parliament. Asgill was a solicitor, one of whose clients—the Dr Barbon who built the new square of Lincoln's Inn—bequeathed him a considerable sum of money. Barbon had purchased the rotten borough of Braumber—consisting of a single street—and Asgill availed himself of this property to secure a seat in the House of Commons, and with it the privilege of freedom from arrest. Officers were in waiting to take him when his expulsion occurred, but he managed to make his escape. Sir Richard Steele, of *Tatler* fame, was expelled from the House of Commons for having 'maliciously insinuated that the Protestant

succession in the House of Hanover is in danger under Her Majesty's administration.' He was expelled by a majority of nearly one hundred in a house of four hundred members. Another well-known case is that of Sir Robert Walpole. The accusation of corruption brought against Walpole by the Commissioners of Public Accounts was made in December 1711. They charged him with having taken two notes of hand—one for five hundred guineas, and the other for five hundred pounds—while he was Secretary of War, for forage contracts in Scotland. In consequence of these reports, he was heard in his own defence on the 17th of January 1712. Ultimately, the House resolved that he had been guilty of a high breach of trust, that he should be committed to the Tower, and expelled the House. Next morning, Walpole surrendered himself as a prisoner, and was committed to the Tower, where he remained till the prorogation of Parliament. A new writ having been issued for Lynn, he was re-elected; but on a petition by Mr Samuel Taylor, the opposing candidate, the House declared Walpole incapable of sitting in that Parliament.

Although no power exercised by the House of Commons is more undoubted than that of expelling a member as a punishment for grave offences, yet expulsion, whilst it vacates the seat of a member and a new writ is immediately issued, does not create any disability on the part of the offending member to serve again in Parliament. John Wilkes was expelled in 1764 for being the author of a seditious libel. In the next Parliament (1769) he was again expelled for another libel. A new writ was ordered for the county of Middlesex, which he represented, and he was re-elected without a contest, upon which it was resolved that 'having been in this Parliament expelled this House, he was and is incapable of being elected as a member to serve in this present Parliament.' The election was declared void; but Mr Wilkes was again elected. His election was once more declared void, and another writ issued. A new expedient was now tried. Mr Luttrell, then a member, accepted the Chiltern Hundreds, and stood against Wilkes. Being defeated, he petitioned against the return of his opponent. The House resolved that, although a majority of the electors had voted for Wilkes, Mr Luttrell ought to have been returned, and they amended the return accordingly. Against these proceedings the electors of Middlesex presented a petition without effect, as the House declared that Luttrell was duly elected. The whole of these proceedings were at the time severely condemned by public opinion, and were proved by unanswerable arguments to be illegal. On the 3d of May 1772 the resolution of the 17th February 1769 was ordered to be expunged from the journals 'as subversive of the rights of the whole body of electors of this kingdom.'

Our readers are already familiar with the more recent case of the late Mr Bradlaugh, who, having been expelled, or at least rejected, was immediately returned by the electors of Northampton, and no question was raised as to the validity of his return. Expulsion and perpetual disability had been part of the punishment inflicted upon Mr Arthur Hall in 1580 and on other members. During the Long Parliament, incapacity for serv-

ing in the Parliament then assembled was frequently part of the sentence of expulsion; but these cases and that of Walpole are declared by no less an authority than Sir Erskine May to be simply examples of an excess of their jurisdiction by the Commons. One memorable case of expulsion was that of Lord Cochrane, who, with others, was charged with conspiracy in the spreading of false reports of the death of Napoleon Bonaparte and the defeat of the French in battle, in order to affect English government stocks to his own profit. Lord Cochrane was fined one thousand pounds, sentenced to twelve months' imprisonment, and ordered to stand in the pillory, then situated opposite the Royal Exchange.

One case of a member fleeing from justice is that of James Sadlier, against whom a true bill was found for fraud in July 1856. A warrant was issued for his apprehension, but could not be served, as he had absconded. A motion was made for his expulsion on the ground that he was a fugitive from justice; but as this measure was considered premature, the House refused at that time to interpose. However, on the 16th of February 1857, reports of the Crown solicitors and officers of the constabulary were submitted, showing the measures which had since been ineffectually taken to arrest Sadlier and bring him up for trial. He was expelled from the House, as having fled from justice.

Expulsions have been generally resorted to for offences which render members unfit for a seat in Parliament, and which, if not so punished, would bring discredit upon Parliament itself. Members of Parliament have been expelled as being in open rebellion, as having been guilty of forgery, perjury, frauds, and breach of trust, misappropriation of public money, conspiracy to defraud, corruption in the administration of justice or in public offices, or in the execution of their duty as members of the House, of conduct unbecoming the character of an officer and a gentleman, or of libels and various other offences committed against the House itself.

WHAT'S IN A NAME?

"JOHN HAYES!" exclaimed Judge Benton. 'What of him? That's a name I ought to know well enough. There wasn't a better-known man in Texas in early days, unless it was old Sam Houston himself.'

Judge Benton, Doctor Gossett—or Doc. Gossett as he was familiarly termed—and I had been out on an antelope hunt together, and the three of us were sitting on our blankets smoking and telling stories round a smouldering fire of buffalo-chips on Bijou Creek, about fifty miles from Denver. It was the Doctor who had mentioned the name of John Hayes.

'That's so,' assented he emphatically. 'He was a well-known man, and no mistake. John Hayes did me a good turn once, and that, too, by the mere force of his name, I can tell you.—But go on, Judge, and let us hear what they used to say of him in Texas.'

'Only this,' answered Judge Benton, 'that in those hard times, when our life was one continual

struggle against the Mexicans on one side and the Comanches on the other, it was reckoned that we had no braver man, no harder fighter, and no cooler leader of men, than John Hayes. He was a little man to look at, but he was all there. Our Texas rangers knew a man when they saw him, and they all allowed that they had no better man among them than he was. The Comanches jumped him once when he was alone on the prairie, and he made a running fight of it till they shot his horse from under him; but that didn't finish him by a good deal, for on foot he managed to get into the rocks he had been making for, and there he, single-handed, killed seven of them, and escaped. He was a perfect terror in a tight place, and could whip his weight in wild-cats.—But let us hear how Jack Hayes ever helped you. You never told us that you had been in Texas.

'No more I have,' answered Doc. Gossett with a laugh; 'but his name and reputation were known outside of the Lone Star State. I was in California in '49, and it was there the thing happened. You know how, when the great rush to the gold-diggings broke out, men just poured out of Frisco in streams as fast as they were landed from the ships. They packed their blankets and their grub on their backs, and simply struck out for the mines, with or without friends, just as might happen. I was alone, and had no particular friends; but I started up country along with a crowd who had been on the same ship as I, and we camped together just for the sake of company. We weren't partners, you understand, or anything like that; one half of us didn't even know the names of the other half, and for that matter there were a good few that one didn't want to know. But I tell you it was a wonderful sight to see those crowds of men on the march; and at night their camp-fires along the gulches made it look like an army broke loose.'

Here Doc. Gossett found that his pipe was out. He knocked the ashes out of it against his boot-heel and looked across at me. 'Will you let me have a pipeful of that English tobacco of yours, Thompson?' said he. 'I've a fancy to see what it's like.'

'Certainly—with pleasure,' I answered, handing him over the pouch. He filled up, and proceeded with his story.

'Well, it so fell out that a ruffian called Yankee Sullivan was going up to the mines at the same time along with a gang of rowdies of his own sort. He was a regular low-down shoulder-striker, a plug-ugly of the worst description. He was hanged afterwards by the Vigilance Committee in San Francisco, and richly he deserved it. He and two or three more of his gang used to think it fun, when they'd had their suppers, to go around to the different camps near by and see if they could spot any greenhorns, regular softies, you know; and as soon as they'd found one, they would simply turn to and say all the low mean things they could think of, and get off their jokes on him, and insult him, till the poor wretch would feel fit to sink into the earth with shame. We had heard of their goings-on; but they hadn't been round to see us, till one

night they plumped right into our camp and made themselves at home. They sat down by the fire and looked around, and passed a few words with some of our crowd—men, as I told you, I'd fought pretty shy of. Presently they spotted a couple of Johnny Raws among us, and set to work to roast them, and, my word for it, but I tell you those poor fellows got it hot. I wouldn't have been talked to like that for all the gold in California. I didn't know what to do. I was a bit of a raw hand myself in these days, and I thought my turn was bound to come next. After a while they got tired of tormenting those two poor craven-spirited wretches, and Yankee Sullivan stood up—he was a huge big six-foot man—and swung himself round to look for another victim. He saw close beside him a little dark-eyed man quietly sitting there whittling a chip with a knife, and watching him. Yankee Sullivan brought down his great paw on the little man's shoulder. "Well, sonny," said he, "and what's your name?"

'The little man never started or shrunk away, nor even moved, but he just looked up straight in his eyes and said in the gentlest voice: "My name, sir, is John Hayes."

'Never in all my life did anything do me so much good as to see Yankee Sullivan curl up when he heard that. He didn't seem as if he could say "Bo!" to a two-year-old boy. He never opened his mouth, but he just walked right out of our camp, and the rest of his gang after him. You bet they knew who Jack Hayes was, and they didn't want any fuss with him or with any one around where he was. His name alone was quite enough for them; that cooled them off mightily.'

'He did you a good turn that time, sure enough,' said Judge Benton. 'But for all that, a man may have a big name as a fighting man and yet not be able always to run a bluff on people so easy. Did I ever tell how Slade was once backed down by a boy here in Denver?'

'No,' answered the Doctor. 'Fire away.'

'First tell me who Slade was, please,' I interjected. I had not been long in the country, and was ignorant of many things that were familiar to the others as household words.

'Slade,' answered Judge Benton explanatorily, 'was a man who was hanged by the Vigilantes in Montana a few years back. He killed a terrible lot of men. He's got friends too, still, has Slade, who maintain that he never killed a man who didn't need killing badly; but however that may be, he certainly did kill a great many. He was a desperado, and a very cruel one. He had a spite against Jules, the Frenchman, for an old grudge, and he bided his time, and just laid for him till his chance came, and then he did simply kill him. Then, if any one ever dunned him for a debt, he used to remind him how he settled matters with Jules, and explain that that was his way of paying off old scores. One time he was down here in Denver on a visit, and he owed a bill at Ensor's drug store. The principal wanted to collect it, but he didn't quite like the job, and so he sent his head-clerk to ask Slade for the money. The clerk didn't like it either; but he had to do it or lose his place; so he started out, and soon found Slade on the street, and presented his bill. Slade looked at it, read it, looked up at the clerk, and

said roughly: "Did Mr Ensor tell you to give me this thing?"

"Yes, Mr Slade," answered the clerk, trembling.

"Very well," said Slade, handing it back to him, "you can take it right back to your principal, and tell him that if he or any other man dares to offer me a thing like that again, I'll do for him."

"The clerk was only too pleased to get off so cheaply, and he fled back to the store and told his story. Mr Ensor was nonplussed. He was very far from being a fighting man himself, and he began to think Slade's bill was a hopelessly bad debt. But he had in his store a boy of seventeen, named Powell, who was learning to be a drug-clerk. He heard all that went on, and fired up at the idea of a bully like Slade evading payment of a just debt just because he had the name of being a desperado. He spoke up. "Mr Ensor," said he, "if you'll give me that bill to collect, I'll see if I can get Mr Slade to fork out."

"Ensor looked at him, and thought it a pity to send such a youth into the jaws of such an old tiger as Slade; but business is business, and the boy was a Western boy, bred up on the frontier. He knew what Slade was as well as anybody, and understood quite well what he was volunteering for.

"All right, Powell," said Mr Ensor. "Try it if you like. You can take it to him."

"Powell stepped around to his room and got a short bowie-knife that he had there. He took this in his right hand, holding it with the blade lying flat against the inside of his wrist, under the cuff of his sleeve. He took the bill in his left hand, found Slade, and presented it to him without a word. Slade looked at it, recognised it, looked up and caught the burning eyes of the boy watching him like a panther ready to spring.

"Did you get this from Mr Ensor?" asked Slade.

"Yes, sir," answered the boy, clutching the handle of the knife hard.

"Did you hear the message I sent him about it?" inquired the desperado.

"Yes, sir," answered the boy again, shutting his lips the moment the words were out of them, and holding his breath for the struggle. "Now, then, it's my life or his," he thought, bracing himself ready to strike straight at Slade's heart if he saw his hand moving towards his pistol.

"But Slade just folded up the bill and put it in his pocket. "You can tell Mr Ensor," said he quietly, "that I haven't got the money about me at this moment, but that I'll call around before I leave town and settle it;" and the man-tiger turned on his heel and walked off; and what's more, he sent one of his chums round with the cash that afternoon. Curious thing for Slade to do, wasn't it?"

"You can bet Slade knew that boy had come prepared for a fight after that message," said Doc. Gossett. "Now, I take it, Slade was no fool, and knew he'd be thought a lot worse of if he killed a boy—killed him, one may say, for nothing; and then, too, he saw that the boy was mighty liable to kill him. Probably there were none of his own crowd round to spot him, so he just backed down. That's how it must have happened, I should guess, for there aren't many men alive

who can say—say it truly, that is—that they've bluffed Slade."

"Yes," said I, "after all, there is such a thing as conscience even in a ruffian like that. Slade knew he was doing wrong in threatening to kill an innocent person; and when he met some one who dared to defy his threat and stand up for the right, the brute courage which, I suppose, was all he had, failed him."

My companions were silent a moment; then Judge Benton removed his pipe from his mouth and observed thoughtfully: "You think 'tis conscience doth make cowards of us all." I've lived now many years in the Far West, and I never before heard any one suggest that a man like Slade had got such a thing as a conscience. Come to think of it, though, I suppose he may have had one. Certainly, he broke down when he knew he was to be hanged, and a bad conscience might partly account for it, for no one ever questioned his courage till then."

"Excuse me, Judge," said Doc. Gossett; "but I can't quite follow you there. First of all, I don't think a human tiger like Slade has any more conscience than a regular man-eater. He begins by killing one man, then another; then he finds that he's got a name as a man-killer, and he has to live up to it. He thinks about it all the time, and he knows that everybody he meets is thinking about it too, and expects him to go on. He knows, too, that every rowdy who is aching to make a name for himself as a desperado is constantly figuring how to kill him, and so he is known everywhere as "the man that shot Slade." By the time that he's got to look on all the world like that, his conscience, if he ever had any, is seared. Perhaps if he could only go off and live peacefully somewhere else, he might repent; but by the time he's killed twenty men, his name is known all over the United States. He can't give up because of the name he's got. But I don't believe he really likes it, I'll admit that. All the time he has got an uneasy sense that he's bound to die some day with his boots on, and he hates it secretly, as they all do; but that secret uneasiness is not conscience, at least not what I call conscience."

"Neither should I call it so," answered the Judge. "I allow that men of the stamp of Slade and Yankee Sullivan do dread the inevitable end of their career, though some of them break down when it comes, and some do not; but I take it that what Mr Thompson meant when he talked about Slade's conscience causing his courage to fail him was not the mere dread of dying with his boots on. Slade may have seen when he looked in the boy's eyes that the boy meant to kill him or be killed, but that never stopped him. He didn't fear being killed in a fight. What I suspect he may have felt was a sudden and overpowering sense of the odiousness of his tiger-like thirst for blood, and a wish, just for a moment, that he were young again like the boy before him with no one's life upon his soul. Even a man as hard as Slade has his moments of regret, when he feels that he would give anything to undo it all and to be young and innocent once more."

"That's what I meant," said I. "I thought a feeling like that might have checked him."

"Maybe so," said Doc. Gossett. "The only pity

is that, if he ever had such feelings, he didn't begin to attend to them about ten or fifteen years earlier. If he had, he might have come down perhaps to live as a peaceable ranchman, out here, say, on Bijou, and there would have been about a hundred more people left alive, that's all.'

'Yes,' said the Judge; 'if a man would only hold himself in when first his conscience begins to prick him, there would be less work for my profession in this world; and less for yours too, Doctor, for that matter. However, both Slade and his victims have gone before a Higher Court by this time, and somewhere and somehow justice is done at last.'

THE MONTH:

SCIENCE AND ARTS.

THE meeting of the British Association at Cardiff may be regarded as one of the most successful of these annual gatherings in the cause of science. The President's address, which largely dealt with the applications of the Spectroscope and Photography to Astronomy, was full of interest. In the course of his remarks, Dr Huggins, who himself has been the principal worker in these branches of astronomy, told his hearers how the modern gelatine photographic dry plate had rendered possible the portraiture of bodies so distant that they are quite invisible; but the light having on the chemical surface a cumulative action, the picturing of the unseen becomes possible.

The International Congress of Hygiene and Demography, which lately met in London, under the able presidency of the Prince of Wales, represents perhaps the most important meeting of scientific men which this century has seen. That this must be at once conceded, a glance at the sections into which the work of the Congress has been necessarily cut, together with the names of the presidents of those divisions, will at once show. Thus, we find that Section I., which dealt with 'Preventive Medicine,' was presided over by Sir Joseph Fayrer; Section II., 'Bacteriology,' was under the care of Sir Joseph Lister; 'Chemistry and Physics in Relation to Hygiene,' in the able hands of Sir Henry Roscoe; and so on. The amount of work performed by the various sections was enormous, as any one might judge from the condensed reports, which covered for the time several columns of the daily newspapers. It embraced, indeed, every matter which could in the most remote manner be associated with the question of Health, from food and air for the living to the best mode of sepulture for the dead. It is a matter for regret that none of the party politicians who, as ministers of the Crown, are supposed to have several of the subjects dealt with by the Congress under their especial care, thought fit to attend the opening of this important Congress.

At a recent meeting of the American Institute of Mining Engineers, an interesting discussion took place relative to the advantages gained from adding small quantities of aluminium to steel ingots. It was stated that for open hearth steel containing less than .05 per cent. of carbon, from five to ten ounces of aluminium per ton of steel

is sufficient; but that Bessemer steel requires about thirty per cent. more aluminium to secure the same results. It was also said that the action of aluminium is about twenty times as powerful as that of silicon. This action is believed to be as follows: the blowholes in the steel ingot are due to occluded carbonic oxide gas, and it is proved by experiment that aluminium has the power of reducing that gas. In one experiment where a large quantity of carbonic oxide was blown through a crucible of molten steel containing aluminium, the carbon in the steel was increased by thirty-five per cent. owing to the reduction of the gas.

Mr Francis Galton describes in *Nature* an unusual meteorological occurrence which had been reported to him by a friend in Shropshire. On a calm day, when there did not appear to be a breath of wind, the hay in a certain field suddenly acquired a rotary movement, and before many minutes had elapsed, formed a column which seemed to connect the earth with the sky. The height of this column may be gauged when it is mentioned that after the phenomenon had subsided the hay continued to fall in patches for a period of four hours.

Further boring operations at Dover, where coal was discovered some months ago, give satisfactory results. Six seams of coal have already been pierced, and these average in thickness about eighteen inches. It is believed that when a greater depth is attained the mineral will present itself in far thicker beds, and this theory is to be tested by continuing the boring before it is definitely decided whether a shaft shall be sunk at the spot.

The City of London is at last making active preparations for the installation of the electric light within its somewhat limited area, for the City proper only covers one square mile of surface. But within these limits there are no fewer than fifty-six miles of streets, comprising noble thoroughfares and narrow lanes. All these are to be illuminated by electricity, for the carrying out of which work the City has been divided, like ancient Gaul, into three parts, or districts, in each of which a different electric lighting company will lay its mains. Both arc and incandescent lights will cater for public approval; but it is already pretty definitely established that the former are more suitable for open-air purposes, and the latter for indoor use.

An interesting description of the Chinese varnish exported from Hankow comes from the British consul at that city. This valuable product comes from the gum of 'Rhus vernicifera,' incisions being made in the trunk of the tree before daylight, so that the gum which oozes from them may be gathered and strained through cotton cloth in darkness. The access of light causes the gum to congeal with all its impurities embedded in it. Moisture also causes it to solidify, so that in wet weather it cannot be strained; but, curiously enough, the varnish is always applied to the object to be treated when the weather is damp, for otherwise it will always remain sticky. The coat of varnish usually takes a month to dry, but we are not told how during that long period it is protected from dust and insects. The consul has suggested that this varnish may possibly have been one of the

ingredients comprised in the celebrated Cremona varnish, to which some of the mellow tones of the famous violins were to be attributed. He thinks that it might be worth the attention of modern musical-instrument manufacturers.

The *Pharmaceutical Journal* recently described the discovery of a quantity of quicksilver in a walnut tree. The tree, which measured about four feet in diameter, was being cut in a timber-yard when the saw encountered a cavity full of the liquid metal. This opening had evidently been bored out, and had been originally plugged with a piece of deal after the mercury had been inserted; but round this deal plug about eighteen inches of walnut wood had grown. It is estimated that the quicksilver must have been placed in the tree about two centuries ago, and probably under the mistaken belief that its presence would get rid of some insect pest which had attacked the wood. There is an old belief that the presence of metal will have a favourable effect in such a case, and the Chinese have a similar notion, which induces them to endeavour to cure an ailing tree by driving an iron nail into its trunk.

All who know anything about the physical theory of music are aware that the modern method of tuning a piano or any other similarly keyed instrument represents a compromise, and is known as 'equal temperament.' It was common a few years ago to tune church organs by 'unequal temperament,' by which device certain keys were more perfectly in tune, but at the expense of the others. Many attempts have from time to time been made to construct instruments with an extra number of digitals to the octave, so that each key should be in perfect tune; but, owing to their complication and the difficulty of using them, they have merely represented experimental contrivances. Curiously enough, it has been reserved for a Japanese inventor to show us how the idea can be successfully carried out. Dr Tanaka has made and patented an harmonium in which the octave is provided with twenty sounds, which are under ready control of the player. It has been exhibited lately both in Germany and England, and has been very favourably received. Such an instrument, if it can be produced at a moderate price, would be greatly valued in the musical world.

Many years ago it was proposed that photography should be utilised in establishing a national collection of portraits of eminent persons, and the scheme only failed because it was found that the permanence of a photographic picture could not be guaranteed. Now, however, with improved processes, which are old enough to have been proved, this want of permanence is a thing of the past. To name two only, the Platinotype and Carbon processes; both are capable of yielding pictures which are quite as lasting as the paper upon which they are impressed. So the old scheme has been revived, and has now been started under altered conditions. Under the imposing title of 'The British Museum of Portraits,' the collection is now in the process of formation at South Kensington. The movement is due to the Amateur Photographic Association, of which the Prince of Wales is President.

In the same manner that the old picturesque

line-of-battle ship has been superseded by the ugly modern ironclad, so the sailing merchantman has been almost extinguished by the steamer. Even the familiar form of the latter seems to be threatened by a new kind of construction, which from its shape is known as a 'whaleback.' Such a vessel was recently discharging her cargo, consisting of eight thousand tons of grain, at Liverpool, after a voyage from Montreal occupying fifteen days. This curious vessel is built of steel throughout, and her top, which can hardly be called a deck, is of convex form, so that any water which may be shipped runs off immediately. There are nine hatches or plates, which are screwed on or off as may be necessary; and the crew have further access to the outer world by means of two conning turrets, one fore and the other aft. The crew consists of twenty men, whose lives must be passed in the body of the vessel except during good weather. The length of the ship is two hundred and sixty-five feet, with a beam of fifty-eight feet, and a depth of twenty-four feet. Water-ballast can be pumped into the vessel in bad weather so as to submerge it entirely with the exception of the two turrets. Four other vessels built on a similar plan are running on the American lakes, but they are of smaller capacity.

A boat of quite another kind has been built at the works of Messrs Wyss & Co., and is now afloat for experimental purposes on Lake Zürich. This little vessel is built entirely of aluminium, and owing to the extreme lightness of that metal, its total weight is less than half that of a boat of the same size built of iron or steel. This vessel, or rather launch, is fitted with a two-horse-power petroleum engine, will carry six persons, and will travel at six miles an hour. It is noteworthy that the metal of which this launch is built was reduced from its native clay by electric process at the aluminium works at Schaffhausen. The dynamo machines at these works obtain their energy from turbines worked by the celebrated falls of the Rhine. The owners are therefore able to boast that the new vessel owes its origin to Swiss labour, Swiss material, and even Swiss motive-power. It is believed that such vessels made of aluminium, which possesses such advantages in strength, freedom from corrosion, and lightness, will gradually supersede, on the Swiss lakes at least, those built of iron.

For a long time past most of the public clocks in Paris, as well as the timepieces in banks, hotels, clubs, and in many private houses, have been kept going by means of pneumatic power supplied from a central station; and to supply them with the necessary compressed air, a network of pipes has been laid beneath the city streets. Owing recently to one of these pipes being broken during the operation of taking up a portion of the roadway, all the clocks upon the pneumatic system, to the number of about ten thousand, suddenly stopped, to the great inconvenience of the business portion of the community. It was impossible to remedy the mischief at once, and the easiest plan was found to be to start the clocks once more at exactly twelve hours after the accident, thus obviating the necessity of altering the hands of each individual clock. The system of supplying water, gas, electricity, air,

&c., from one fixed point is good in itself, for it represents economy of labour and materials; but this case of stoppage shows that it is not without its inconveniences.

M. Flammarion, a popular French writer on meteorological subjects, several of whose works have been translated into English, has lately been busying himself with an inquiry into the change of climate, which, during the past few years, has made itself disagreeably felt. From statistics which he has gathered, he shows that in every part of France and the Continent during the past six years, the thermometer has been getting lower and lower, the fall being more noticeable in the spring than in the other seasons of the year. Great Britain shows a similar excess of cold weather; while, strange to say, Denmark, Norway, Sweden, and Russia, which we have been accustomed to regard as cold countries, have during the past four years had a higher temperature than that to which they are accustomed. M. Flammarion goes farther back than this, and quotes history to show that in past years many trees which once flourished in Northern France are now found only in the south, while others have disappeared altogether. Among these are named the lemon, which no longer grows at Languedoc; the orange, which has deserted Roussillon; and the Lombardy poplar, which has disappeared from the country altogether. He also points out that many noted vintages have ceased to be, owing to the impossibility of growing the grapes under the altered climatic conditions. There is not now a single vineyard, he tells us, to be found north of Paris.

According to the United States consul at Jerusalem, the agricultural success of Palestine depends principally upon the wonderful capacity of the soil for vine-growing. At the present time this industry pays from forty to fifty per cent. better than any other kind of produce, the best wines being made by the German and Jewish colonists round about Jaffa and its neighbourhood. The old native vineyards are still in active cultivation, and it is believed that within a short time the hillsides of Judea will be covered with vines to an extent never previously known. It is curious to reflect that this result is either probable or possible in a rainless land; yet it is a fact that during the whole period of growth from the blossom to the fruit, no drop of rain comes to the thirsty soil, the nightly mist which blows in from the Mediterranean supplying its place and bringing in the needful moisture. It is perhaps due to these conditions that the vines are wholly free from mildew, and are not subject to diseases affecting them in other countries.

For some time past French agriculturists have been using as a remedy against vine, tomato, and potato insect pests a mixture which is known as *bouilli bordelaise*, which consists of three per cent. each of lime and sulphate of copper in water. The same effectual remedy has recently been tried with success in destroying a fungus which attacks beetroot, the leaves becoming at once more luxuriant and the root growing richer in sugar. It is believed that the remedy may be found applicable in other cases of plant-disease, and as it is very cheap in preparation and easily applied, agriculturists of an experimental turn are advised to give it a trial.

Some interesting particulars, gleaned from Reports by United States consuls concerning the macaroni industry of Italy, have lately been published. Originally, the term was applied to bits of paste and cheese pressed into balls; but modern macaroni, including vermicelli and the various fanciful forms of paste used in soups, is made of wheat-meal or flour, eggs, and water. Its manufacture is as much a household operation as is the work of breadmaking in our own country districts, and it may be said that the work is equally simple in both cases. The ingredients are made into a paste with hot water, rolled out on a board, and after being left for a short time to dry, the sheet of paste is rolled up and the ends cut off in slices. These as they separate form strings of macaroni. The material is also made on a commercial scale at various factories where steam-machinery of the most perfect type is in use. In these factories the paste is forced through moulds, which give it its familiar pipe-like form. Good macaroni cannot be made from soft or tender wheat, and for this reason foreign grain is never employed if Italian can be obtained. The industry is a very large one, small factories being found in every part of Italy; but it is impossible to ascertain the amount of macaroni actually produced.

A number of experiments were recently carried out with a new explosive called 'Ammonite' at the works of the Miners' Safety Explosive Company, Stanford-le-Hope, Essex. This new compound is a mixture of ammonium nitrate and nitro-naphthaline, both of which are in themselves inexplodable, but when combined, are capable of exerting enormous disruptive force. In the first experiment a cylindrical shot weighing twenty-nine pounds was fired from a mortar several times, five grammes of a different explosive being used on each occasion. While the gunpowder charge threw the shot a hundred and thirty-six yards, and dynamite two hundred and eighty-nine yards, the new explosive headed the list with a range of three hundred and twenty yards. Another experiment showed that while nearly every other explosive was fired by a weight falling upon it from a height, ammonite remained intact. A still more convincing proof of its freedom from ignition by percussion, was shown when rifle bullets were fired at a number of ammonite cartridges attached to a board. It is quite evident that in ammonite we have an explosive of very great value, which can be manufactured and handled with an amount of safety which cannot be claimed for any other compound of a like nature.

The recent meeting at Bournemouth of the British Medical Association was a most successful one, and several papers of great interest to laymen as well as to the profession were read. Among these was an able one by Dr Lauder Brunton entitled 'Twenty-five Years of Medical Progress.' In the course of this paper, Dr Brunton gave a curious instance of the manner in which evil often begets good. The stupidity and cupidity of the Spaniards of the Cordilleras many years ago induced them to reap a rapid harvest by cutting down all their cinchona trees without pausing to plant fresh ones. This made the valuable drug quinine to become for a time very scarce, and its price ran up to a fabulous amount.

Chemists then tried to prepare the drug synthetically, for it was evident that a fortune awaited a successful result. Perkins in the endeavour to solve the problem discovered the aniline colours, and the impulse which his labours gave to the study of aromatic compounds led to the production of salicylic acid, antipyrin, and other drugs without number, which have been invaluable to medicine. It may be mentioned that the wonderful staining powers of the aniline dyes have been most useful in histological research, and have made it possible to distinguish disease germs under the microscope which otherwise would have been quite invisible.

MY INDULGENCE PASSAGE.

An 'Indulgence Passage' is the name given to the permission to travel in a troop-ship which is sometimes granted by the naval authorities to people who cannot claim a passage as a right, but who, being themselves in the naval or military services, or closely connected with those who are, receive such an indulgence. This is of course a great boon to officers and their wives going on or returning from leave; or to one who, not being very well, wants a change; or to relatives wishing to visit those near or dear to them serving abroad.

I am a military officer, stationed at Malta, and I thought it would be very pleasant to get away from that hot-house during the month of August, even for ten days; so I asked for an indulgence passage in the troop-ship *Himalaya*, which was to call at Malta and proceed from there to Cyprus and Egypt. My request having been granted, and having received eleven days' leave, which would give a day to spare in case the ship did not return so punctually as she generally does, I started upon my indulgence passage, and felt much cooler even before Malta was quite out of sight. I doubt whether I could have looked back on the passage as an 'indulgence' if seasickness had tormented me; but, as almost for the first time at sea, it did not, and as every one on board was most kind, I felt with gratitude that I had been really indulged. Indulgence men-passengers pay six shillings and sixpence per diem for their food; and ladies, five shillings and sixpence. It certainly was an indulgence to have a look at Cyprus and Egypt, and a pleasant time on board for ten days with people many of whom were friends, and all of whom were connected with my own profession, for the sum of three pounds five shillings.

There are two classes of troop-ships. First, the great Indian ones, and then those that go to foreign stations not in India. To this second class belongs the old *Himalaya*, as she is affectionately called, because almost every one of any standing in the services has had a passage in her, and because she dates back from the Crimean war. Her size may be estimated from the fact that there were on board, when we returned from Egypt to Malta, no fewer than fifteen hundred soldiers, and yet there was room. She is fitted up with electric light and all modern improvements.

What strikes a person taking a passage for the first time in one of these floating barracks is the

excellency of the order and discipline that prevails. They might be described as gigantic hold-alls, for there is in them everything from a needle to an anchor; but there is a place for everything, and everything is in its place. Even the ladies, who sometimes do not know their place, and who are wont to quarrel about precedence in reference to berths, seats at dinner, and other important trifles, are gradually wheeled into line by the tact and experience of the paymaster, who, poor man, looks after such matters.

As for the ship's company, they seemed to be always doing something. They obeyed orders at the double, and so cheerfully, that it did one good to see them. We were much interested in some of the drills they went through. When the bugle sounded 'Man overboard,' or 'Fire,' or 'Prepare to abandon ship' (in boats), every man knew his place, and got into it in what seemed to us a very short time indeed. One poor lady became quite excited as she looked on at the last-named drill, and could not understand that it was only make-believe, as the children say. She ran about asking which boat she was to get into.

For the first two days of the voyage, people did not know each other well, and were either suffering from or fearing an attack of sea-sickness. After this, the saloon piano began to be played, then there was singing, and occasionally a little dance. When a regiment came on board, its band played every evening outside the saloon while we were at dinner. One evening the blue-jackets and soldiers gave a very good entertainment on the quarter-deck, when several amusing songs were sung. But indeed there was always something to interest us. A troop-ship is like a small town, and whether you look at the workshops where the different artificers are working, or at the doings of the blue-jackets and soldiers, or at the horses, dogs, and other less common pets of the officers and men, you will not find time hang heavy on your hands. Some get quite excited over the ship's run, and make small bets as to the day and hour of her arrival at the next calling-place. Then there are deck-quoits and other games which give an appetite for the numerous meals that seem to succeed each other so quickly. We spent one morning on our return from Egypt examining the three colours or standards of Nejumi which were taken at the battle of Toski. An officer on board was bringing them as a present to the Duke of Cambridge, and he kindly showed them to us.

The first land we saw after leaving Malta was Crete, along which we sailed for most of a day. It was very rugged, and we decided that one particularly high mountain was Ida, where the ancients said Zeus was educated. On the morning of the fifth day we arrived at Limasol, which is one of the apologies for a harbour at Cyprus. The officers of the ship told us that there was nothing to see, and that it was not worth while landing. That, however, is what they say of most places; so we did land, and were much amused and interested. Limasol is a little town, consisting of flat-roofed mud-houses, some stone stores that were made at the time of the English occupation, a rather nice Greek church, and a mosque. The streets, which are narrow and

dirty, now and then bring you into very quaint courts, round which sit apathetic Turks smoking their hubble-bubbles quite regardless of the speed of the nineteenth century elsewhere. Nearly as many things are sold in the streets as in the little open shops or bazaars. Women were selling brilliantly-coloured silks, embroidery, and of course the 'curios' and Roman antiquities of which every one here seems to be possessed. The great production of the island is grapes. In the little market I bought for a piastre, which is about a penny, two or three pounds of very fine ones. But, indeed, the table of weights and measures at Cyprus is decidedly vague. When I had selected a box of 'Turkish Delight,' the man proceeded to weigh it by putting into the opposite scale a horseshoe, two stones, and a small coil of wire! Of course I was satisfied.

In these days, when national customs and costumes are being more and more assimilated, it is pleasant to come upon a place like Cyprus where this is not the case. Men and women dress for the most part like Turks and Greeks; but the boots they wear are a national peculiarity. They come up over the knee, and are an inch, or sometimes as much as two inches thick in the soles, which are studded with nails so broad that they look like iron plates. I was told that some people do not take off these boots day or night as long as they last; and of one man who, being unable to do so, went to a doctor, when his foot came off along with the boot!

We had six hours to remain on shore, and might have seen more of the island if there had been roads and we could have got a conveyance. The only road, however, in this part of the island is that which goes to Polimedia, where our soldiers are encamped in winter, and on to Mount Troödos, which is their summer camp. This last place was between thirty and forty miles from us; so we could not think of it. Nicosia, the capital, was also too far away; and so was Famagusta, with its famous ruins and monastery.

So, after spending some time at the little club, we returned to the ship. On our way we passed a place where they were auctioning skinfuls of wine. The auctioneer handed me a glass to taste. I thought it horrible, though it must have been necessarily pure, for anything the Cypriots could adulterate it with, even water, would cost more than the juice of the grape. If they ever knew the art of making wine, they have lost it now.

We left Cyprus at 2.30 o'clock on a Wednesday, much interested by what we had seen, and greatly admiring the shapes of its receding hills, with Mount Olympus crowning all. On the next day, about three o'clock, we sighted Ramleh and the low-lying forts of Alexandria. After dinner, we landed, and for four hours drove about the streets and suburbs. We were told by the captain on this Thursday night that the ship would not sail until Saturday morning at seven o'clock; so what were we to do next day? We had seen Ramleh, Pompey's Pillar, Ras-et-Teen Palace, and driven under the palm-trees along the banks of the Mahmoodeeyeh Canal; and this is all we were told to see in Alexandria. So I thought of Cairo. If I went up by the morn-

ing express train and returned by the afternoon one, I would have a three hours' glimpse at the wonderful city. With a certain amount of contempt for myself as a Yankee tourist, I resolved to do the journey of two hundred miles there and back, not so much for what I could see in Cairo in three hours, as that I might see the country between the two cities, which is the most fertile part of Egypt. And I consider that I was well repaid, for I saw Arab villages that were strange to me, beautiful crops of cotton and maize, a laborious process of irrigation which made to blossom as a rose what otherwise would have been a desert, strings of camels bearing great burdens, and large slate-coloured buffaloes at work along the banks of canal or river.

At the Cairo station I saw a man who looked like a guide, and I asked him to show me round. He began to enumerate all the things I ought to see. 'I know,' I said, having to interrupt his learned-off catalogue, 'that it would take three months, or even three years, to see Cairo properly; but as I have only three hours, I shall not attempt to do more than visit the three places I was advised to see—namely, the Citadel, the Gezeereh Palace, and the Arab quarters.' Getting into a carriage, we did this, and drove back through some fine boulevards to the station just five minutes before the hour for the train. What a view we had from the Citadel! Below was Cairo with its thousand mosques; at a distance, though looking nearer than they were, stood out in the clear air three large pyramids in one place, and nine smaller ones in another. Then there was the Desert, which I had always wished to see; and the Nile, most wonderful of rivers. At the Citadel, I visited the mosque of Mahomet Ali, which is almost made of or at least lined with alabaster; also the oldest mosque in Cairo, at both of which we had the experience of having large slippers put on over our boots. The drive to the Palace of Gezeereh was most pleasant. It is on the left bank of the river, under beautiful palms. The only other place we were able to see was a little bit of the Arab quarter.

VIGIL.

AN Love, if to-night, in the long dark hours—
The desert that leads from dusk to dawn—
You came through the tumult of winds and showers
To the lonely house and the shadowy lawn;
In the hour of release for your gentle ghost,
In the hour when we hope and believe the most;
Though your steps, as they always were, be light,
I should hear you come through the storm to-night.

A clear space breaks in the windy sky,
And cruelly bright the moon looks through;
The tempest ends in its deepest sigh,
The fields are silver with frosty dew;
Now, now, while the day is a sleeping child,
And the tortured world again takes breath;
Come back from your Eden undefiled,
With a gift in your hand, of life or death.

A SOLDIER AND A GENTLEMAN.*

By J. MACLAREN COBBAN,

AUTHOR OF 'THE CURE OF SOULS,' 'TINTED VAPOURS,' 'MASTER OF HIS FATE,' &c.

CHAPTER I.—AN EVENING OF ADVENTURE.

It was an unusually hot week of the uncertain month of July. The heavens were as brass, and the elements seemed melting with fervent heat. There was not stirring anywhere a breath of air to suggest coolness. The leaves of the trees in the parks looked scorched, the grass was parched and brown, and the ornamental waters appeared stagnant and unwholesome. Throughout all London the bricks were baking, and the people sweltering in the direct and reflected sunshine; but nowhere was the heat more fetid and stifling than about Soho. The atmosphere was charged not only with the exhalations of a poor and densely-packed population, but also with the odours of neglected refuse, vegetable and other, in the courts and the streets. In the early evening, women with babies and women without, neither very much tied nor very much buttoned, sat on door-steps, or leaned against door-posts with their arms lazily crossed; while half-clad children played and shouted and perspired in the gutters or ran in and out of the shady courts; and hulking or evil-looking men, with pipes in their mouths and their hands in their pockets, hung about corners and the swinging doors of public-houses. In Dean Street the only active persons to be seen were two or three costermongers with barrows of fish or fruit, who, with their arms and their throats bare, urged their laggard donkeys as feelingly and yelled as lustily as usual; and a melting postman in unofficial straw hat who urged his weary rat-tat round.

There was another, a tall, well-built young man, who emerged from one of the houses, a

miracle of coolness. He was dressed in a tweed suit and a round hat, and he carried a pair of gloves and a little cane which was much too short to walk with. He was turning down the street with a swinging stride when he observed the postman. He returned to the door from which he had come, and waited till the postman approached. 'Anything,' he asked, 'for George Ferrers?'

The postman carelessly glanced at the address of two or three of his letters, said 'No,' and passed on.

George Ferrers jerked out a nod of acknowledgment of his courtesy, tucked his little cane under his arm, set his hat a little more jauntily over his eye, strode away, his step ringing clear on the pavement. He was evidently not in the calmest of tempers. Once or twice he muttered angrily to himself, and beat his thigh with his cane. He swung right on his way, elbowing aside without compunction the hulking loafers, who turned with a furious 'Wot the——!' which became a cheerful 'All right, guv'nor,' when they saw the tall muscular figure. The children stopped their play to look up at him, and the women glanced at him with approval and seductiveness.

'Fine man, ain't he?'—'Looks like a officer'—'There's a gen'lman for yer!' were some of the least questionable of the comments made on his appearance—comments which his quick ear caught, and which somewhat soothed his temper; for to the average healthy man there is nothing more agreeable than the admiration of woman-kind. He twirled his fair curling moustache with an air, fastened, in spite of the heat, one

button of his coat, the better to show off the lines of his figure, squared his shoulders and swelled his chest, and marched with something of that bow of the leg which marks the matured Lifeguardsman. Through the squalid swarming streets of Soho and St Giles he thus made his way, and arrived in St Martin's Lane, crossing which, he found himself at the corner of Long Acre. There he paused, and debated with himself a moment, slowly twisting the ends of his moustache. He was hungry. Should he content himself with bread-and-cheese and a glass of ale in a tavern? Or, should he deny himself the ale, and have something more staying and nutritious in the *à-la-mode* beef-shop at his elbow? Though he had what he called 'a thirst' upon him, he decided for the diet without drink, and turning on his heel, he entered the shop *à-la-mode*.

It is scarcely fair to expose all the base shifts to which patient merit may be reduced, and how it has often parsimoniously to consider the purchasing power of a penny. Let it suffice to say that George Ferrers made a tolerable meal, to which a piquant relish was imparted by the kind looks of the plump, though somewhat untidy, serving-girl behind the counter. The box in which he sat to consume his viands was inadequate. The seat was narrow, and his knees touched the bench on the other side of the little table. A little man might have enjoyed in it complete privacy except from the overseeing eye of the counter-girl; but George Ferrers could conceal no more than his plate and a few buttons of his waistcoat. He sat so high that he could see into all the other boxes, and he felt that his dominant height had a depressing effect on the dirty carters—themselves bulky men—and the nondescript loafers who were feeding in them. He hurried, therefore, through his meal, paid for it—not forgetting to tip the plump serving-girl, who responded with a surprised, 'Thank you, sir'—and returned into the street.

He chinked his change in his hand, and dropped it into his pocket with as much of a pang of anxiety as his cheerful spirit would permit him to feel. The few pieces of silver and copper—making one-and-ninepence in all—were the amount of his pecuniary resources, and he had no immediate prospect of more. Yet he must have a smoke. He had had his appetite for food but half allayed; for it took a good deal to keep his continent of body in condition; but he knew he would feel satisfied if he had a pipeful of tobacco. Turning down St Martin's Lane, therefore, he entered a tobacconist's and purchased a half-ounce of his favourite mixture. Then filling and lighting his pipe, he strolled serenely and gallantly down to Trafalgar Square. He leaned over the parapet, knitted his brows, smoked hard, and asked himself what he should do.

He was where he had often been of an evening before. He leaned on the parapet and looked away down over the silent fountains into Whitehall, to that front of the Horse Guards where, in other days, he had often appeared in all the glittering panoply of war, on his black horse, in steel cuirass and gorgeous helmet. England had been to him a pretty hard step-mother. She

had taken twelve good years of his life; had marched and counter-marched him; had sent him to the Soudan—whence he had returned but a year ago, a gaunt and sun-burnt member of the famous Camel Corps—and had then turned him adrift and shown no further interest in him. He did not complain: he was too well drilled a soldier and of too cheerful a nature to do that; but as he let his eye rove round, still asking himself in the backward of his thought what he was going to do, he resented the fat and prosperous appearance of the crowd surging and perspiring east and west, and north and south, in loose coats and white waistcoats. He wondered how they would look if they were collected into a regiment and marched into the desert, where there was only a modicum of the tinned 'junk' of Australia or Chicago to eat, and not a drop of water to drink; and if, when choking and cracking with thirst, a horde of fuzzy-headed, gigantic black fiends came howling down upon them, thrusting at them with shovel-headed spears, and hacking mightily at them with huge crusader swords. Of what use would they be in a trial of pluck, strength, and endurance? And yet he reckoned there was not one but had gold and silver in his pocket, while he had only one-and-sevenpence, and did not know where to get another shilling. Of course he had a father, a farmer in a dale of Cumberland; but he was not going to beg money of the old man—no, not if he were starving. Trafalgar Square, he had heard, is the centre of London, and London is the centre of the world; therefore, he stood in the very heart, or bull's eye, of the life, wealth, and business of the world. He was well placed, then, and ought to get on. Yet why had he received no answer to any one of his own advertisements, or of his replies to the advertisements of others? He could not guess, unless it were that for a big fellow with curling moustaches and long legs, who had served twelve years in the Life Guards, there was no place in civilian life.

So he asked himself again what he was going to do. He was resolved he would not go to his lodging that night—the dingy, frowsy garret in Soho—without having settled something one way or another about his future. He had heard it said, 'Adventures are to the adventurous;' and since an adventure had not sought him out, he thought he had better seek out an adventure. Which way should he go?—North, south, east, or west? He stooped—regardless of the curious side-looks of the passers-by—set his little cane erect on the pavement and let it go. It fell at once to the west; and to the west—into Clubland—he at once set off. His pipe was empty and his mouth was dry: he let his tongue 'click' against his palate, to assure himself how much he was in need of a drink. He thought he might indulge himself to the extent of a half-pint, since he must presently—he laughed—run against a frail old gentleman who needed a prop for his declining years, or a lonely dowager who longed to adopt a son; and he knew himself as strong as a tree and as active and willing as a horse.

The sun had set with the cloudless glow of a furnace behind the further end of Pall Mall, and the stifling breathless shades of night seemed

to rise from the ground as much as they sank from the sky, as he left Trafalgar Square.

'Here goes!' said he; and he turned up the narrow street on his right to 'wet his whistle' before committing himself to the search for adventure in the west. He turned into the bar of the first public-house and asked for a half-pint of 'old and bitter'—the Guardsman's favourite drink.

'Old and bitter, sir?' said the smart barmaid, looking not unkindly on his stalwart figure and handsome good-natured face as she drew the liquor. She seemed not disinclined to conversation; but she was anticipated by a well-dressed, black-muzzled man, with his tall hat tilted back, who sat on a stool, smoked a cigar, and drank spirits-and-water. 'Have a cigar, mister?' asked the man, displaying an open cigar-case.

'Thanks—no,' said Ferrers. 'I prefer a pipe;' and he produced and filled it. He had that instinct of English reserve which repels the familiar advance of a stranger.

'Excuse me,' said the man; 'but you've been a soldier—haven't you? I've been a soldier myself.'

'In the Horse Marines, wasn't it?' said Ferrers with a laugh.

'No, sir; in the American army.'

'I thought,' said Ferrers, 'you didn't look like a soldier. May I ask you a question?'

'You may, sir.'

'Aren't you an Irishman?'

'I am; and proud of the fact, sir, of belonging to that down-trodden nation. Why do you ask?'

'Oh, just because I thought only a down-trodden Irishman would go and serve under a foreign flag and then brag about it to an English soldier.'

'I served in America, sir, not as a private, but as an officer. In your blessed English army, would I have had a chance of being an officer?'

'I hope not,' said Ferrers with a laugh.

'No,' continued the Irishman, pulling his hat on and getting warmer. 'I'd have had a lot of insolent bloated aristocrats over me.'

'Perhaps,' said Ferrers, 'you know more aristocrats than I do. But I've known some, and I'd prefer them to the only officer of the American army I ever met. My captain was a Viscount, and my major was a Duke, and they were the best fellows I ever knew. Of course they lost their temper sometimes, and sometimes swore a bit; but every man that is a man does that. But I've fought shoulder to shoulder with them in square in the Soudan; we've drunk the same dirty water from the same confounded water-bottle; and we've sung the same songs riding through the desert. And if I were on my last legs, I'd ask them to help me before I'd ask anybody else; and they'd do it too.—What do you think of that?'

'What do I think of that, sir?' said the Irishman, rising from his stool, swallowing the last drops of his liquor, and moving to the door. 'I think that very likely you blacked their boots.' Saying that, he was gone, and Ferrers' toe was too late to help him out.

'You had him there,' laughed the barmaid; 'and he's bolted.'

'He has,' said Ferrers. 'But I may meet him another day.'

He finished his drink and departed, thinking over what he had said. His defence of his officers was quite unpremeditated. They had not been in his thought, and it had not occurred to him to appeal to them to find a way for him out of his present dead-lock. But now that the suggestion had arisen quite of itself, as one might say, he asked himself, 'Why not?'

So he marched on westward, till he found clubs to right of him, clubs to left of him, each one volleying forth from open windows above and below the liquorish and appetising odours of good cookery. Lord Debrett, he knew, was to be heard of at the Junior Carlton; and he walked slowly past its ample and imposing doorway. But a glance at the hall porter, who was taking the air on the top step, and who looked as important as a Secretary of State, and far more alarming than his late captain, and a glimpse of the gorgeous marble interior, so daunted him that he lost heart.

He passed on and up St James's Street, and so into Piccadilly, and on again westward. He was offered sundry adventures of a doubtful kind, but he marched steadily on. The roadway was thronged with omnibuses, and red-eyed hansoms and carriages bearing people from home and dinner to theatre, opera, or party; and the pavements were peopled with well-dressed persons of both sexes; but nowhere did he perceive a hint of the frail old gentleman or the lonely dowager who, he had hoped, were longing to adopt him.

When he was near his old barracks of Knightsbridge, he thought he was about as far west as civilisation and opportunity could extend, and as Fate could expect him to go. However, he consulted chance again, as he had done before. He set his cane upright on the pavement and let it fall. It fell without an instant's hesitation to the east.

'Very well,' said he to himself. 'Back I go.' So he returned the way he had come, his hope of adventure sinking lower and lower the nearer he approached to Trafalgar Square. At last he was back in his former place, leaning over the parapet. It was now quite dark, as dark, that is, as it ever is on a hot, clear-skied summer night. The space below him around the fountains was inhabited by dark figures, moving, as it seemed, aimlessly about; while the benches were almost completely filled—with the unemployed,' he thought.

'I'm one of the unemployed,' he said to himself. 'I'll have a seat.' He descended the steps, made room for himself on a bench and lighted his pipe. He sat thus for a little while musing. He saw in imagination his old home in the Cumberland hills under the summer night—the rich fields sloping down from the dear, ivy-clad house, and the sheltering wood behind. In fancy he heard the bark of the watchdog—bark answering unto bark all down and round the dale—and the low of the kine returned to pasture from the evening milking; he smelt, too, the sweet cool odour of the new-mown hay, the rich evanescent scent of the roses in the farm-garden, and of the honeysuckle in the hedges round; and a lump rose in his throat, and he wondered whether, after all, he had not better return, like the prodigal, to his father and take what place could be found for him. Suddenly he became aware of

loud and angry voices not far off; and looking up, he saw near one of the fountain-basins a dark knot of people which was drawing to itself more and more dark units from all sides. He rose and went over. As he approached, a shrill female voice rose in the air—'Police!' and continued in a key but little below the shrillest: 'I'll see if you'll molest a woman going quietly about her business—you bad man! you black, nefarious creature—you!'

Elbowing his way into the centre of the crowd, he saw that the 'bad man' on whom the woman's rage was concentrated was the black-muzzled Irishman. He was declaring to the amused or indifferent bystanders that the woman had done this and that, and had said this and that to him.

'Why don't you let the woman alone?' demanded Ferrers. 'Is it Irish or American manners to make a row with a woman in a public place?'

'Mind your own business,' said the furious Irishman, 'you infernal English lamp-post!'

Ferrers said not a word; but stepping up to him, gripped him by the waist, raised him and shook him as a mastiff might shake a yapping cur, and dropped him into the water of the fountain-basin. The crowd, which had held its breath a moment, now roared with laughter: the ducking was a joke it could appreciate.

CHAPTER II.—COMRADES.

'By Jove!' Ferrers heard a voice exclaim behind him, 'I've known only one man that could lift another man like that!'

He thought he knew the voice. He turned, and saw a gentleman in evening dress about as tall as himself pushing towards him. It was Lord Debrett, who came and looked him in the face and grasped his hand.

'What? By Jove! it is you really, Ferrers. What are you doing here? Come along. The police are sure to turn up now when it's all over, and they may want to collar you.'

The Irish-American had scrambled out of his unexpected bath, and dripping with wet and fury he cried: 'I'll remember you for this! I'll spot you!'

'You'd better scuttle home,' said Lord Debrett, 'and change your clothes, or you'll catch cold.' And having thus said, he took Ferrers' arm and led him outside the crowd, where he was joined by another gentleman in evening dress. 'I was right,' said Lord Debrett.—'Let me introduce to you, Sir William, my old comrade, Ferrers of the Blues—Sergeant Ferrers that was.'

Sir William bowed somewhat stiffly; and Ferrers, being taken thus at unawares, returned the bow rather awkwardly. He felt he did not like Sir William, for no other reason, perhaps, than that he had made him to appear awkward. Sir William was middle-aged, thin-whiskered, lean, and of the middle height.

'Come and let us have a talk,' said Lord Debrett.

Ferrers said nothing; the presence of Sir William kept him from being quite easy and frank with his late captain.

'Were you going anywhere in particular?' asked Lord Debrett.

'No, my lord,' said Ferrers; 'I was just hanging about.'

'Well, Sir William and I were just walking down to the Gaiety for an hour; we have to go somewhere else afterwards.—Suppose, Dawlish, you go on to the theatre and come back and find me in the smoking-room of the Club?'

'That will suit me very well,' said Sir William.

'And me too,' thought Ferrers; and he bowed adieu to Sir William Dawlish with the greatest good-will, supposing he saw the last of him. But he had not done that by any means; and thereby hangs our tale.

The comrades-in-arms walked off together along Pall Mall.

'Who was the man you ducked, Ferrers?' asked Lord Debrett.

'I don't know, my lord,' answered Ferrers. 'I met him first an hour or more ago, when he was calling English officers names; and I came across him again now rowing with a woman, so I settled both counts by sousing him.'

Lord Debrett laughed. 'But look here, Ferrers. Don't call me "my lord" or "captain" when we meet like this, any more than I call you "sergeant." We've been comrades; and if it hadn't been for you, my bones would be bleaching with the rest at Abu Klea; so just call me Debrett, as I call you Ferrers.'

'Very well,' said Ferrers, feeling not unnaturally somewhat lifted up.

'Now, tell me what you've been doing since I saw you a year ago. I thought you had made up your mind to stay in the country with your father.'

'So I had.'

'And why didn't you go?' asked Debrett.

'I did go. And I stayed with him all through the winter and spring. But I got tired of the country; I wanted to be back in London; and so I came away about six weeks ago before all my money was spent.'

'And how have you been getting on since?'

'Well, times are not too lively.'

'But you've got something to do, I suppose?'

'No; nothing.'

'Nothing! That's bad. You've tried, I suppose?'

'Tried! I should think so!'

'But you're clever. You can write well and tot up accounts.'

'There are lots can do that better than me. I haven't tried for that.'

'What have you tried for?'

'I've tried for drawing'—

'I know you can draw and paint first class.'

'Well, I've offered myself as a War Artist, and shown some of my things. They liked them; but there ain't a war on, nor expected—worse luck!—So they just took my name in case anything should turn up; though they seemed to think I was too big, too noticeable, and would take too much to keep.'

'Little nippers of men, I suppose,' said Debrett, 'would do better for that.'

'I've offered myself,' continued Ferrers, warming to his narrative, 'to teach the use of the sabre in a fencing-gallery; but it appears nobody wants to learn cavalry practice, and rapier practice I don't know.'

'Humph!' grunted Debrett meditatively.

'I've offered myself as a riding-master; but they wondered if they had any horse strong enough to carry me. And I've answered advertisements for lots of other things, but without getting any reply. The fact is I seem to be too big for anything, except a door ornament with buttons for a swell shop or restaurant.'

'The doose you are!' exclaimed Lord Debrett, meditatively twisting his moustache. 'I daresay now if I broke loose and spent till I could get no more to spend, and if I had to take up some occupation, they'd think me too big, by Jove!'

'Oh,' said Ferrers, 'you're a lord. For that, the bigger the better.'

'Is that it? So being called a lord has its advantages.'

'I should think so—rather,' said Ferrers with a laugh.

'But go on,' said Debrett. 'Tell me about yourself. You mean to go on trying to get something, I suppose?'

'I mean to go on trying; though, to tell the truth, I don't know what to try for next.'

'Do you think I can do anything for you? If you find yourself short, you know, Ferrers'—

'Oh, I'm all right,' said Ferrers quickly.

Debrett was suspicious. 'Come now, Ferrers,' said he; 'on your oath—how much money have you got?'

'Well, Debrett, to tell you the truth, I've only got one-and-fivepence left.'

'Good heavens! One-and-fivepence! And,' he declared with a touch of contrition in his voice, 'I'm smoking, I believe, a one-and-sixpenny Partaga!—But you haven't been on starvation rations, surely! Now I look close at you, you're rather thin and pale.'

'Well, for a fortnight or so I've just managed to throw dust in the eyes of my appetite, so to speak. But it takes an enormous deal to choke off this appetite of mine.'

'Come along; come and have something,' said Lord Debrett, hurrying him into the Junior Carlton, through the great swinging doors, up the broad steps, and into the depths beyond.

Ferrers cast a glance in passing at the watchful Secretary of State in the porter's box, and wondered that an hour before he should have been so afraid of him. He was led into a private dining-room and set down at a table. He was asked what he would like, and with little hesitation he declared for cold beef, bread, and bitter ale. He asked Debrett if he was not going to eat also. Debrett said he could not, having little more than finished dinner.

'But,' said he, 'I'll keep you company with a drink.'

Then he refused to say another word till his friend had eaten his meal. He sat in an easy-chair, pulled his moustache, and ruminated. Presently, when Ferrers' efforts had slackened a little, he turned to him as if he had come to a weighty conclusion. 'Do you know, Ferrers,' said he, 'I think you've not come enough the old soldier, as you used to say; you've been too straightforward and frank with those civilians.'

'What do you mean, Debrett?' asked Ferrers.

'Well, you haven't bounced. You've just led them to think you were a poor devil of a simple

soldier, strong, deserving, and willing. That was a mistake.'

'How do you mean?'

'Don't you see? There was a want of generalship about it. You remember how Drury Lowe took Cairo? With a bit of bounce!'

'Yes, by Jingo!' said Ferrers with enthusiasm. 'Pluck first and bounce afterwards.'

'Well, there you are,' said Debrett. 'You've got pluck, but no bounce. Now look here. Though you're not a gentleman, Ferrers—you know what I mean, that you haven't birth, or estates, or that sort of thing—you'd very well pass for a gentleman with most people: you look like a gentleman, and you have the manners of a gentleman.'

'I've lived with your lordship so long,' said Ferrers.

'Don't say that again, Ferrers. It's only when you open your mouth and say something of that sort that you show, to anybody that knows, that you're not the proper thing. Don't say much to these civilians, and whatever you do don't be humble. Go about well dressed—you know how—call yourself captain or colonel; keep a stiff back, and, if you think it will work, be quietly insolent: those civilian beggars, I believe, will like you all the better for it.'

'I believe you're right,' said Ferrers, with his brows puckered in attention.

'Of course I'm right. I've seen it many a time. Now you take my tip and you'll get on.'

Lord Debrett uttered himself solemnly, as if what he said was the result of the garnered observation of a lifetime; and very likely it was.

'I believe you're right,' repeated Ferrers. 'Why, I've seen jokers myself, since I've been about now, come that game. They've stepped in and looked round as if all the place belonged to 'em, and they've ordered a cup of coffee and a slice as if they could buy up all the stores if they liked, and they've got served better and quicker than anybody else.'

'That's rough sort of practice, though,' said Debrett, sagely shaking his head. 'That's overdoing it. Don't overdo it, Ferrers.'

'I quite understand,' said Ferrers; 'oh yes. There's a way of doing it, of course.'

'Well, you take the right way and you'll get on.'

The simple comrades then adjourned to the smoking-room, where presently Sir William Dawlish entered and found them. Ferrers was not embarrassed, as he had been before, by Sir William's presence; for one thing, the baronet appeared less reserved and more friendly; and, for another, Ferrers was lustily primed with food and drink, and emboldened with the advice given him by Lord Debrett.

'Dawlish,' said Debrett, leaning well back in his lounge-chair and stretching his long legs—all three being provided with the accompaniments of a smoking-room lounge—'my friend Ferrers wants something to do: he's doosid hard-up. Can you recommend him anything?'

'Well,' said Sir William, with a smile that seemed to Ferrers more like a grin: it showed all his teeth—'well,' said he, 'if Mr Ferrers will excuse my saying it—he had the look when I first saw him of a hard-up man. I've had a large

experience,' continued he with another grin, 'of hard-up people: I'm commonly one of them myself.'

'But can you recommend him to anything?' asked Lord Debrett. 'He's a good fellow; he can always hold his tongue and keep his head.'

'An excellent character to have,' said Sir William, nodding and grinning; 'and I have no doubt he deserves it.'

'He is too confoundedly civil,' thought Ferrers. 'What does he mean by it?'

'Of course he does,' said Lord Debrett. 'I wasn't paying a compliment; I was merely recommending a good man.'

'But what,' asked Sir William, 'is Mr Ferrers' line?'

'I am a yeoman's son,' said Ferrers, speaking for himself, with a frank touch of pride, 'and I know something of farming; and I've served my twelve years in the Blues, from private to sergeant'—

'And he knows all that can be learned in the Guards,' broke in Debrett, 'and a good deal more besides.'

'And how's the education, may I ask?' said Sir William.

'Oh, that's all right,' said Debrett again before Ferrers could reply; 'besides drawing, calisthenics, and the use of the globes, and all that sort of thing.—But have you something in your eye, Dawlish, that might occupy any of Ferrers' talents?'

'I have a notion of something that would need a good many talents—one in particular.'

'Ah, now,' said Debrett, 'there's something at last; while Ferrers feared it might be something he had already tried.'

Sir William looked at him with a smile, and said: 'Mr Ferrers, I suppose, is an old enough soldier to carry out instructions without demanding an explanation?'

'I should think so,' answered Debrett.—'Eh, Ferrers?'

'Certainly I am,' said Ferrers.

'But what's on, Dawlish?' asked Debrett. 'Not a burglary or an abduction, eh?'

'You're not so good a soldier as Mr Ferrers,' said Sir William, grinning again: 'you want an explanation.'

'But I'm not going to take service,' answered the other.

'Well,' said Sir William, when he had considered a moment, 'it's neither a burglary nor an abduction; it's neither more nor less than a game I want to play with some wealthy and hard-fisted connections of mine in the City.—I had a brother,' he continued, leaning forward, to Lord Debrett, while his eye constantly turned to Ferrers, 'who made a pile of money as a banker. All his property was left in charge of his two partners—stupid, precise, old City men—and it's with them I have a little game on; and I have been thinking that Mr Ferrers might help me in it. I don't mind telling you in confidence that there is a lady concerned: a soldier is always ready to help a lady.'

'What do you say, Ferrers?' asked Debrett.

'Oh,' said Ferrers, 'I'm quite ready to have any game that's not against the law, with jokers of that sort.'

'I'll take care of the law,' said Sir William

with a grin. 'Now,' said he, considering his finger-nails a moment, 'for your help in this business I can afford to give you a hundred pounds and your expenses. You're not above taking money for a service rendered, I suppose, Mr Ferrers?'

'Unfortunately, I cannot afford to be,' said Ferrers.

'That's all right. Will my suggestion, then, suit you?'

'Perfectly,' said Ferrers. 'But I hope, Sir William, you won't think it too early if I ask you now what you want me to do.'

'It's quite necessary,' said Sir William politely, 'and by no means premature. I want you to call yourself "William Dawlish," and, to use what I believe is a vulgar phrase, to behave as such. That's all.'

'William Dawlish?' said Ferrers. 'I am supposed to be your son. Is that it?'

'We are not responsible for what people may suppose. But I perceive, Mr Ferrers, in your question a tendency to overdo it.'

'What I said,' remarked Debrett parenthetically. 'Don't overdo it, Ferrers.'

'No; don't,' said Sir William. 'It will be as well not to say you are my son, because you are not.'

'So far as you know, Dawlish,' suggested Lord Debrett.'

'So far,' assented Sir William, 'as I know.'

'I begin to understand,' said Ferrers. 'I must play the game of "William Dawlish" with plain cards.'

'With plain cards as much as possible,' assented Sir William. 'If any one, for instance, should ask you point-blank, "Are you Sir William Dawlish's son?" you'll play low and say, "What has that to do with you?" or something of that sort. There are always people asking for information: your business is *not* to give it 'em. And always remember that whatever you do or say I've got to back you up in it—if it come to that; so I must rely on you not to compromise me.'

'Let me ask you, Sir William,' said Ferrers, 'this one thing more: there is nothing illegal, nothing wrong, no real damage to any one, I mean, in this game?'

'Nothing whatever,' said Sir William. 'You will have to act a fib for my sake, and especially for the sake of a certain lady. I have no precise instructions at present; only prepare to be William Dawlish.'

'I think, Sir William, I begin to see the thing,' said Ferrers. He was still perplexed; but he was afraid to appear stupid by asking questions.

'Now,' said Sir William, producing a cheque-book and a Livermore pen, 'I'll give you a cheque for fifty pounds on account of expenses.—You must dress properly, you know' (with a glance at Ferrers' rough tweed suit, which made him blush), 'and you must get a proper address and visiting-cards with "Mr William Dawlish" on them.'

'By Jove,' exclaimed Lord Debrett, 'this is going to be sport!'

'But remember,' said Sir William with warning pen, 'it is strictly between us three.'

'Oh, mum's the word,' said Lord Debrett.

'There will be no difficulty, I suppose,' said Sir

William to Ferrers, 'about leaving your present lodgings?'

'None at all,' said Ferrers.

'Well,' said Sir William, 'drive up to my rooms, No. — Jermyn Street, in a hansom at twelve o'clock to-morrow morning.'

'Oh, I shall come to breakfast, Dawlish!' exclaimed Lord Debreitt.

'Do,' said Sir William.—'And,' continued he to Ferrers, 'have a good, big, stout portmanteau with you—not too new and not too light.—Now, Debreitt,' said he with another of his grins, glancing at the mantel-clock, 'I think it's quite time we went.'

They rose.—'Ah, by the way,' said he, 'that cheque is drawn on my late brother's bank. It is possible they may detain you to make inquiries;' and he grinned again. 'But don't be disturbed: I'll make it all right.'

'In that case,' said Ferrers, 'had I not better have a—little loose cash, to make sure of keeping my morning appointment with you, Sir William?'

'That's well bethought,' said Sir William; and he took from his pocket-book a five-pound note and handed it to Ferrers.

Then they went out.

'What's the game, I wonder?' said Lord Debreitt in Ferrers' ear as he bade him 'good-night.'

OUR HOLY WELLS.

We are still in possession of the numerous Holy Wells esteemed by our forefathers for their curative properties, though most of us have long ceased to look at them from precisely the same point of view as that from which they regarded them. Nevertheless, we do not slight them altogether. St Winifred's Well, at Holywell, in Flintshire, is still a shrine in the eyes of antiquaries; and learned antiquarian societies visit it, and thoroughly appreciate its legends, surroundings, and architectural and archaeological features, as much as sanitarians value and admire the enormous yield of its spring. The forty stones marking the old penitential stations in the beautiful glen are still to be counted, and are even now, if we may believe report, occasionally kissed, it may be surreptitiously, in the hope that some of the old healing properties or influences may be secured by that ceremony. Annually, hundreds of tourists scan the superb chapel built by the mother of Henry VII. over the well, and the clever arrangement of the crutches left in it by those who were healed in old times, by means of which a decorative effect, as of rich open timber-work, is given to the roof. There are perhaps a score of holy wells of almost equal renown, locally, in North Wales, many of which have or had small ornamental chapels built over them. Dr Johnson mentions a chapel over a well near St Asaph's that he was taken to see when on a visit to the Thrales, that is not now in existence, probably on account of the spring being used to turn a neighbouring mill; and similar removals may have been made of others that had fallen into decay; and we have word, moreover, of the intentional destruction of another for the purpose of disillusion; but not-

withstanding these disappearances, the examples left us are still numerous.

There is an atmosphere of peace and architectural propriety about St Winifred's Well. William the Conqueror, Henry II., Edward I., and James II. are said to have devoutly repaired to it; and both before and after their days countless devotees resorted to it. But not many miles away there is another well of a very different character. This is the Cursing Well of St Elian, in the parish of Llanellian, about two miles from Colwyn Bay. By placing upon a pebble the initials of any person to whom evil fortune is desired, and then dropping the stone into the well, a terrible curse, such as a great calamity or sudden death, is ensured to the individual thus indicated. It was stated at an Antiquarian Congress held last year that not very long ago vindictive people from all parts of Wales went to Llanellian to put those they wished to curse into the well in this fashion, and that the general dread of the proceeding was great beyond belief. Moreover, it formed the occupation of a custodian to search for the pebbles bearing the initials of any person who wished to be relieved from the curse, or taken out of the well, as it was called, who also advised the persons so unfortunate as to be thus condemned as to the best means to take to circumvent the curse. Pennant, the antiquary, relates that he was threatened by a man whom he had offended with the curse of St Elian, and with an intimation that he would journey to the well to put the curse into effect. The Goblin Well, near the Goblin Tower, Denbigh, if there is anything in a name, is not to be compared with the characteristics of St Winifred's Well, either. There is another well, too, of a somewhat different repute from the majority; this is the well of St George, at Cegidoc, near Abergelen, which was esteemed for the recovery it ensured to horses suffering from disease. They were sprinkled with the water and blessed in the name of the saint. Rich people offered a horse at this shrine to secure a blessing to all the rest that belonged to them. As a rule, however, a holy well was associated with the relief of human sickness of various kinds.

The water of St Tecla's Well was considered specially useful for the falling-sickness, which was known as St Tecla's disease. After washing in the well at sundown and making an offering, the patient walked round it three times, repeating a prayer each time. The offering was a hen if the patient was a woman, and a cock if of the masculine sex. In either case, the fowl was also carried round the well and then round the church. The invalids were required to remain in the church all night. A Bible served for a pillow; the space under the communion table for a bed; and a carpet or cloth for covering. At break of day, after offering sixpence and leaving the fowl in the church, they departed, content with the understanding that if the bird died they would be cured. In the case of the well of St Beuno, it was necessary, after ablution in its waters, for the invalid to pass the night upon the tomb of the saint in the church, which was covered with rushes to make it tolerably comfortable, and, for one poor paralytic person, with a feather-bed. Offerings were made to this

church on Trinity Sunday of such calves and lambs as happened to be born with a certain mark on the ear that was called St Beuno's mark. These were sold by the churchwardens; and the money they brought was put into a chest made of a solid piece of oak, with three strong locks to it, which proceeding gave rise to the saying: 'You may as well try to break up St Beuno's chest.'

The well of St Peris was described by Penant, at the close of the last century, as being enclosed with a wall in his day. He relates that the sibyl of the place told the fortunes of those who visited it by the appearance or non-appearance of a little fish which lurked in some of its holes. St Trillo's Well, on the verge of the seashore on the way towards the Little Ormes Head from Colwyn Bay, has a chapel built over it of interesting antiquity. Another chapel over a well, known as Ffynnon Fair, is now in ruins; but there are registers extant belonging to it in which record is kept of various clandestine marriages that were performed at night in it. To the south of the Norman castle at Dysarth is an ivy-covered ruin of another sacred well, known as Siamber Wen; and within a mile or so of the same stronghold is the well admired by Dr Johnson, which now turns the mill-wheel. Close to Llanbaidr Church there is a well called Ffynnon St Dyfnog, that was once in great repute as 'vertuous waters,' and attracted large numbers of sick persons, whose offerings are in evidence in the Jesse window in the church. There is a well, too, near the church of Llan-Aelhaearn, the saint with an iron eyebrow, that was also much frequented on account of its sanctity. A chapel once covered St Helen's Well, near Carnarvon, also. At Aberdaron there is a fountain of fresh water, at the foot of a promontory, below high-water mark, that was frequented by devotees, who believed if they carried a mouthful of the water safely to the summit of the rocks, their desire would be granted.

In Cornwall there are several wells with chapels built over them; they are dedicated to St Austell, St Piran, St Cleer, St Levan, and St Agnes. The little oratory over St Austell's fount has a stone-groined roof and two doorways, and is about nine or ten feet long by a width of six feet. The chapel over St Levan's Well is smaller, or about nine feet square. A larger example at Horsebridge is about double these dimensions, and fifteen feet in height. There are several others in ruins, as at Bellarmins Tor and Vale. There is also a place called Holywell in this county, as in many others. There are different virtues ascribed to the various wells, one of which confers mastership upon the one of a newly-wedded pair that is the first to taste of its waters after the marriage ceremony.

Well-chapels are not so numerous in other parts of the kingdom. The health-giving springs are more frequently left to find their way to the nearest stream without any attempt to enclose them. At Holystone, in Northumberland, near the Cheviots, there is a well or spring which is identified as the waters in which Paulinus baptised the Northumbrians in the days of the Heptarchy. It presents the aspect of an oblong pool about forty feet long and twenty-four feet wide. It

stands in a plantation of firs and larches; and in the centre of the quadrangular basin is a tall stone cross inscribed with a notification that Paulinus the Bishop baptised three thousand Northumbrians there at Easter DCXXVII. The spot is kept in neat order, and seats are placed for visitors to rest.

In the same county there is a well of much interest near Flodden Field, the same fountain-cell, built by Sybil Grey, to which Sir Walter Scott made Marmion indebted for his last draught after his mortal wound. It is on a hill-side, and now has some lines from the poem cut into its new and handsome granite front. Those who climb to drink of the waters of this well can see the battle-field and note the different directions occupied by the troops, the mound, or Piper's Hill, where the body of the king was found with so many of the dead 'flowers of the Forest,' and the churchyard, in which heaps of the slain were afterwards buried, for the ground falls away from it, and all is spread out before them uninterruptedly.

The Freeman's Well, on Alnwick Moor, in the same county, though not recognised as a sacred fount, is too remarkable to be passed over. King John, in riding over the moor six centuries ago, fell into a quagmire at this spot; and was so enraged with the burgesses in consequence, that he took their charter from them; and was only induced to return it on condition that every freeman should also wade through it on acquiring the privileges it conferred. Ever since that distant day, and on the anniversary of it, till quite recently, the young men of the town who wished to take up their freedom, as it was called, went through this well, with various formalities, before they were enrolled. As it is about four miles from the town, and riding the boundaries of the three thousand acres of moorland was part of the same ceremony, the candidates were required to ride, and were accompanied by the authorities of the town and of the castle, as well as by a numerous cavalcade of friends, anxious to see how they comported themselves under circumstances that were carefully made as trying as possible. After preliminary formalities with drawn swords in the market-place, the young men rode up the steep street leading to the moor, and began their journey over rocks, ditches, dykes, whins, heather, and other difficulties; and many of them were thrown by the way. They were required by the moor-grievances to stop at every cairn, marking the boundaries, and place a stone upon it. When they came to the well, which is a pool about a hundred yards long and a dozen yards wide, and from three to five feet deep, they dismounted, donned garments gaily decorated, but suitable for immersion, and flung themselves into the water, and each contended with the rest to get to the opposite side first. Ropes of straw hidden in the water, and holes dug here and there, made them stumble and flounder; but in the end they managed to get through. Their friends assisted them to resume their dry clothing; and, remounting, they continued the ride round the moor. On returning to the town, they were hospitably regaled with strong ale at the castle, which they passed on the way back to the market-place, whilst the waits played *Chevy Chase*. A crown bowl of punch in the market-place finished

the proceedings of the day, which were resumed on the following afternoon, that the town might be perambulated and further rejoicings take place.

As in Cornwall, there are places called Holy-well in this county. One is near North Shields, and derives its name from St Mary's Well, the waters of which have the property of turning colour when galls are added to it. Another holy well, at Jesmond, Newcastle-on-Tyne, once very esteemed, was provided with thirty-nine steps.

There were several holy wells in old times in London. One was St Chad's Well, near Battle-bridge, which maintained its reputation into this century. It was surrounded in 1824 by a garden with alleys of clipped hedges, on the gates of which was a board with a notification, 'Health restored and preserved.' There was another near the church of St Pancras. But the most famous was Bride Well, which gave its name to the neighbouring hospital and prison. On the coronation of George IV., Hone tells us, so many thousands of bottles were filled with the water from it that the inhabitants of the parish could not get their usual supply. The suburbs could also boast of many famous wells. Sadler's Wells was more a place of fashionable resort; but Kilburn Wells and Streatham Wells were esteemed for their 'virtuous waters,' like the simple fountains in the Welsh hills that have been mentioned.

Probably there were once ornamental crosses associated with most holy wells. There is an interesting survival of this combination at Geddington, where the Eleanor Cross stands close to a spring, which is indeed at the base of the steps upon which it is placed. The well is covered with a stone erection of two arches, and a few stone steps descend from the level of the road to give access to it. Three statues of the good brave queen look down from their high place, under their cusped canopies, upon the drawers of water who for so many centuries have availed themselves of this spring. It is situated in an open space among the mellow old houses in the village, at a short distance from the church. From an account preserved of the proceedings that took place at Dunstable and St Albans on the occasion of the removal of the dead queen, we may assume that her remains rested on the very spot marked by the cross. Says the chronicler: 'The body of the queen rested in the market-place until the king's Chancellor, and the great men then and there present, had marked a fitting place where they might afterwards erect, at the royal expense, a cross of wonderful size; our prior being then present, and sprinkling holy water.' In the case of Geddington, the existence of the spring may have led to the spot being marked as a fitting place.

From the days when Abraham's servants digged wells, and Isaac digged again the wells of water, it is clear those who have lived before us have set the highest value upon them. The numerous spas—or spaws, as they were written when Sir Walter Scott wrote *St Ronan's Well*—are on a more imposing scale than the little wells here mentioned, but scarcely more appreciated. The water-cure advocated in our own time seems but another phase of the same feeling that took

William the Conqueror to St Winifred's Well, or set Robert of Gloucester writing of 'welles swete and colde.' And though we look at them with new lights, and sanitary science bids us analyse water and examine its surroundings with close scrutiny, and otherwise treat it with suspicion, before we accept it unreservedly as fit for consumption, we must all feel Nature has bestowed few greater boons on mankind than springs of pure water, or, to use the old term which some of them so long enjoyed, our Holy Wells.

DUMARESQ'S DAUGHTER.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,'
'THIS MORTAL COIL,' ETC.

CHAPTER XLIII.—THE FAITH CURE.

FOR a minute or two, they crowded in silent awe and suspense round poor fainting Psyche, whom excess of joy, too sudden joy, had affected so profoundly as no shock of grief could ever have affected that resolute nature. Then Haviland Dumaresq, half seizing her in his arms, led her gently aside; and the *chef de gare*, perceiving her weak and shattered condition, brought out a chair and placed it for her by the wall with something more than mere conventional French politeness. 'Mademoiselle is moved?' he asked good-humouredly. 'Mademoiselle recovers a long-lost friend? A brother, perhaps? A parent? An acquaintance? May I venture to recommend for Mademoiselle some *eau de fleurs d'oranger* in a little water? That calms the nerves. That restores the circulation.'

He brought her that universal panacea of his race in a full tumbler; and Dumaresq, trembling, held it to Psyche's lips. But Psyche waved the sickly decoction away with her hand rapidly, and sat still, fanning herself in a whirl of joy. Her whole soul was divided within her by conflicting emotions. She hardly knew as yet whether she could survive the shock, the terrible shock of finding her painter alive again and restored to her so unexpectedly.

One thing only she did *not* feel—the faintest shame or maidenly shrinking at the way she had flung herself without one thought of reserve into Linnell's arms as he stepped out on the platform. She couldn't tell how, but no doubt or fear remained any longer: she *knew* now, knew to an absolute certainty, that she loved Linnell, and that Linnell loved her. After all they had both done and suffered, the idea of greeting him in any other fashion than that never even occurred to her. Nor, to say the truth, did it occur to Linnell either. For both, in the delight of that unexpected meeting, the past was blotted out at one single blow, and they stood face to face at last rejoicing, too full of joy to admit the intervention of any other smaller or less worthy feeling.

That practical Corona was the first to make a decisive move. 'Say, Cyrus,' she exclaimed, turning round abruptly, 'you've got the checks. I gave 'em to you at Constantine. Just you run and look after my baggage, will you?'

Thus admonished as to the common concerns of our everyday existence, poor crest-fallen Cyrus, feeling himself somewhat awkwardly at a dis-

count in this pretty little domestic drama of European life, went off as he was bid to recover the luggage. In a few minutes more, he returned in triumph to the spot where the little group still sat or stood immovable, and recommended a retreat to the cabs outside with all expedition. For, to say the truth, they were beginning to attract some whispering attention.

'Can you move, dear?' Sirena asked, bending gently over Psyche with sisterly interest: 'or would you like us to ask some of the *dépôt* folk to lift the chair and carry you out to the carriage?'

Psyche rose, abashed at last, from the chair where she sat. 'I can walk,' she answered, now blushing violently, and just conscious for the first time since Linnell's arrival of that alternative aspect of the unexpected episode. 'But where is HE going to stop this evening?'

'Sir Austen?' Corona asked. 'Oh, we've fixed up all that as we came along in the cars. He's going along up with the rest of us to the Orangers.'

'If I may, Psyche,' Linnell added wistfully.

Psyche made no answer, but looked at him through her tears. Then taking her father's hand tremulously in hers, she walked over with the rest to the door of the station. The Arabs and the porters were already engaged in the usual pitched battle outside for the possession of the boxes. Psyche stood by and looked on while the two conflicting powers mounted the luggage on the front with many loud cries and shouts of *Ar-r-ri*.

'We shall want two cabs,' Corona whispered in her brother's ear. 'Let Sir Austen and the Dumaresqs go up alone together.'

Cyrus turned round and gazed with a sudden start into Psyche's face. Psyche blushed: her eyes met his all unawares for a second, and then dropped timidly. Cyrus had not presence of mind to conceal his surprise. 'Why, she sees,' he exclaimed in a tone of the profoundest and most naïf astonishment. 'Have her eyes got all right again while we were away, then, Sirena? She sees to-night just as well as anybody! She walked like an arrow straight out of the *dépôt*!'

Psyche herself started in return, almost equally astonished at this new discovery. In the tumult of mingled emotion and internal feeling at that supreme crisis of her life she actually forgot for the first minute or two she had recovered her sight: or, to speak more correctly, she never so much as remembered at all she had lost it. The moment she heard Linnell's voice in the carriage, her senses were quickened to the utmost pitch of effort and efficiency. She knew it was Linnell: she was sure it was Linnell; and at that sudden revulsion, breaking forward in a wild rush of joy, she looked, without ever even thinking of it, in the direction whence that familiar voice proceeded. In a second, the disused nervous tracts resumed as if by magic their forgotten function. Science was right: it was mere obsolescence. She saw her lover, her dead lover, in that second of joy, as distinctly as she had ever beheld anything on earth in her whole life before.

Yes, Haviland Dumaresq was justified after all. Happiness is the best of all possible tonics. As

they rode up together through the crowded streets, Linnell sitting opposite her in the light *fiacre*, and all the world at once recovered, Psyche still forgot she had ever been blinded. Her father watched her with anxious care. Was it only a false flicker, he wondered to himself, or would her sight come back again as clear and strong and distinct as ever?

Day after day he watched her carefully. Would a relapse come? But he had no need now to watch any longer. The cause was gone, and the effect disappeared as if by magic along with it. For a while, indeed, Psyche's eyes were a little less serviceable and trustworthy than of old: occasional short fits of dimness supervened: the long disuse and waste required to be repaired by gradual rebuilding. But joy works wonders unknown to medicine. With each fresh day spent at the Orangers under these new conditions, Psyche's health recovered itself at once with the marvellous rapidity of early youth. Algiers was glorified for her into an earthly paradise. Those beautiful walks on the breezy hills, those valley strolls among the asphodels and the orchids and the Spanish broom, with Linnell by her side to take her little hand as she clambered among the rocks, and to whisper soft words into her tingling ear, brought unwonted roses back to that cheek, so pale and white in the beginning of the winter. The joy that might have killed her restored her to life. She revelled in the light, the warmth, the sunshine.

For her own part, Psyche had never the courage to hear from Linnell's own lips the true story of that terrible ride for life across the burning desert, and the catastrophe which had wrought them both so much untold misery. But Haviland Dumaresq and Cyrus Vanrenen heard it all the very next day, in the garden at the Orangers, while Psyche sat happy in the tennis-ground below, with Sirena's hand twined in hers gratefully. They heard how Linnell, in his last extremity, escaping from the camp with his cousin Sir Austen, had been intercepted on the open by a strong body of robber Touaregs, not far from Hassion, the very spot where a few years earlier Colonel Platters and his French expedition had all been massacred in cold blood. Sir Austen, whose camel was less fleet than Linnell's, seeing the outlaws approach, had urged his cousin to fly at all speed and leave him to his fate; but the painter, incapable of deserting his tried companion after so many dangers faced and escaped together, had turned to his aid, and in his fluent Arabic endeavoured to parley with their savage assailants. The Touaregs, however, cared but little for either Christian or Moslem. They fired upon Sir Austen, who fell from his seat; and they left him dead in the night on the open sand. Then hacking down Linnell himself with their short swords, they went off with the camels, so that the artist found himself alone in the desert, without food or money, to die of hunger and loss of blood, or be devoured, half dead, by the clanging vultures.

Haviland Dumaresq shuddered as he heard the tale. 'Never tell Psyche,' he cried with his hands clasped tight. 'She's suffered enough and more than enough already. To know how you,

too, suffered would wring her poor heart.—But what did you do then? How did you finally get across to Ouargla?

'I was left on the sands alone,' Linnell answered briefly, 'with my cousin's body lying dead before me. A horrible terror seized me lest the caravan we had just left should come up and overtake us, in which case our sheikh would of course have finished killing what little was left of me. I was faint from my wounds and loss of blood. But there was only myself to do all that need be done. With my own hands, there in the open plain, I scooped a hole in the hot, hot sand, and covered his body over with it decently. After that, I set out all alone to walk northward. The loss of blood had left me very faint: so, crawling and straggling, I hardly know how, failing at times, and dying of thirst, but enduring still—because I wanted to get back at last, for Psyche's sake—I made my way towards Algeria. After two days' floundering alone through the bare sand, dazed and stunned, and half dead with fever, I lay down to die. Just then, a caravan belonging to the Khalifa of Ouargla, who is a French dependent, came by within sight. I signalled with my handkerchief. They picked me up. I promised them money if they took me with them; and they brought me on to their own oasis, where the White Fathers, as you know, generously took charge of me and tended me carefully.—But don't ask me any more at present. I can't bear to talk of it: I can't bear to think of it. The picture of that poor fellow, lying bleeding and dead in the midst of the desert, with the lonely silent sand spreading wide all around, and the blazing sun hanging all day long in the hot gray sky overhead, haunts me still, and will haunt me for ever, till the day I die, with its horrible presence.'

When he finished his story, Cyrus drew a deep sigh of regret. He was glad Miss Dumaresq should have her lover back again; but he did wish events at Cincinnati had permitted him to stop and see her made into a real live baroness. For Cyrus's views on the intricacies of British nomenclature in the matter of titles were as vague as those generally current in the newspaper press of his benighted fatherland.

COLOSSAL SAILING-SHIPS.

THE Victorian era will be especially remarkable for the sturdy strides that have been made in the principles of ship-construction consequent on an immeasurable increase of scientific knowledge enabling mankind to bring into subjection forces of Nature hitherto refractory. Sir Walter Raleigh well said that 'whoever was the first inventor of ships, every age has added somewhat to them.' Many and various are the fables connected with ships of antiquity, whose architects were ranked with the gods, and the ships themselves pictured among the constellations. Bluff-bowed East Indiamen of the good old days have utterly disappeared from active service. They were liberally manned, and barely distinguishable from wooden war-ships of the period. Such superior merchant-craft got under way in the most approved man-of-war fashion, setting and shortening sail in the twinkling of an eye to the shrill notes of a boatswain's call. Occasionally,

they usurped the white ensign appropriate to ships of the royal navy; and passing cargo-craft would lazily lower light sails in courteous recognition of the rights of that flag so celebrated in song and story. Officers of East Indiamen were wont to regard with disdain less fortunate navigators belonging to lowly cargo carriers. Passengers produced better returns to ship-owners than cargo, for as much as three hundred pounds has been paid for an unfurnished stern cabin for the passage from Calcutta to London.

Iron, steel, and steam have done much to drive wooden walls and snow-white sails from off the high seas. During the past quarter of a century important changes have taken place both in the form and in the size of British sailing-ships. These improvements are particularly noticeable when we remember that throughout the previous hundred years shipbuilders remained constant to their old traditions. China alone of all the maritime nations has been content to sit stolidly with folded hands and Oriental fatalism watching the flowing tide of commercial progress move majestically onward. Her carrying-craft of to-day differ but slightly from the ungainly model of ten centuries ago. Even the almond-eyed inhabitants of the Flowery Land, however, have hastened to become possessors of several war-ships of most modern type built by Europeans. It was positively predicted that the days of sailing-ships were numbered when by the masterful mind of De Lesseps the Suez Canal became an accomplished fact. Swift steamships of colossal proportions have availed themselves to the utmost of this short cut to India, China, and the antipodes; nevertheless, the white woven wings of sailing-ships are still to be seen on every sea.

Propulsion by steam and shortening of route have not led to so radical a revolution in our ocean carrying-trade as was fairly anticipated. Truly the hearts of those who go down to the sea in ships shall never again be gladdened by the impressive sight of so goodly a gathering of sailing-vessels as was witnessed at the entrance to the English Channel on the 10th of May 1870. No fewer than three hundred sail of homeward-bounders from every clime were in sight from the deck! This large number included some of the largest and the fleetest ships of that age of clippers, laden with the costliest of cargoes, and straining every rope-yarn to reach their destinations despite an annoying head-wind which sorely taxed the temper of officers and crews. Prevalence of easterly wind not infrequently prevented sailing-ships from making a rapid passage, even though all had gone well until the chalky cliffs of Dover were almost in sight, and supplies of food were sometimes sent to the belated ones. Upon representation made by Lloyd's to the Admiralty, ships of the State were sent on this errand of mercy. On the 15th of September 1890, no fewer than four hundred outward-bound sailing-ships got under way from Elsinore, where they had been detained at anchor by persistent contrary winds. About half-a-dozen of this large fleet of peaceful merchantmen were splendid specimens of our more modern iron clipper-craft on their way to Australia with timber. An overwhelming majority, however, were wooden vessels of small tonnage and inferior build.

Sailing-ships are comparatively fewer in number than formerly, but, on the other hand, they are much larger individually. The unqualified success of steam as a motive-power has almost determined the necessity for the employment of gigantic sailing-ships in order to compete with steamers. Sixty years ago there were only one hundred and fifty British sailing-merchantmen, each of more than five hundred tons register; but size has increased with the flight of time, and there are now in existence more than that number of sailers, each having a register capacity exceeding two thousand tons! In 1860 sailers of one thousand tons register were in demand; and each decade has brought an increase of five hundred tons. Thirty years since, not more than ten sailing-ships of above two thousand tons net register were afloat. They belonged principally to Liverpool, were wooden built, and the largest were the *Donald McKay*, of 2636 tons, and the *British Empire*, of 2679 tons. The former bore the name of her renowned builder; and the latter, originally designed for a steamship, had stranded soon after launching, and been converted into a sailing-ship, so that she never had her engines. There were also the *White Star*, the *Morning Light*, and the *James Baines*, of two thousand three hundred tons. About two dozen ships registered between fifteen hundred to two thousand tons, inclusive of some whose names are as familiar as household words in the families of pioneer settlers in our antipodean colonies. The *Marco Polo*, the *Champion of the Seas*, the *Ocean Monarch*, the *Red Jacket*, the *Tudor*, and the *Lightning*, are far-famed examples that have helped to make history. Both the *Lightning* and the *James Baines* belonged to the Black Ball Line of celebrated Australian packet-ships, which did for passenger traffic what the large steamship lines do now on a more extensive and satisfactory scale. On the 20th of November 1856 the former vessel arrived home from Melbourne with a part freight of gold, wrested from the hard bowels of the southern earth, which was worth five hundred and sixty thousand pounds. Two days later, the *James Baines* came in from the same place with seven hundred thousand pounds! Never again will a sailing-ship be entrusted with so valuable a cargo. British shipbuilders once found it necessary to seek models from yards of the United States; but the introduction of iron in shipbuilding and the abolition of disastrous tonnage laws over here have changed all that for the better.

Builders of merchant-ships are heavily handicapped, for they have to ensure to their customers such ships as shall afford a maximum freight-carrying capacity consistent with speed and safety. Old-time legal measurements were decidedly defective, inasmuch as they merely took into consideration the length and the breadth of a ship, so that a reprehensible tendency was fostered to make ships of insignificant width but of great depth of hold. Such box-built craft could carry much more cargo than far safer models; and since port charges were based upon register tonnage, it seems scarcely necessary to state that ugly ships were at a premium. Being very narrow, they were unable to stand up in a breeze of wind, but were slow and unsafe; whereas American clippers with plenty of beam could

derive advantage from every inch of their lofty spars and startling spread of canvas, which covered them aloft like a vast fleecy cloud. Freight rates between New York and California were then so high, that a shipowner has been known to clear the cost of a vessel by her first passage. From the Golden Gate these swift sailing-ships stretched across to China, and practically monopolised the tea-trade, until supplanted by British ships of half their size, which owed their origin to the repeal of the navigation laws in 1850, and the alteration in laws relating to tonnage four years later. From 1850 to 1860 as much as six or eight guineas per ton was paid for the carriage of tea from China to London; and even ten guineas was once reached. A prize of one pound sterling per ton was awarded to the first ship home with the new season's tea. Life was worth living to a master of a tea-clipper; but the work was not altogether wanting in danger to all concerned.

Now, not only does this country far surpass every other in its total number of carrying-craft and their aggregate tonnage, but also in the quality and capabilities of the ships themselves. America's mercantile marine is alone comparable with that of Great Britain, yet seventy per cent. of their ocean carrying-trade is done by ships of other nations, of which by far the greater part is under the British flag. Of one thousand and six ships which left New York for Europe carrying American grain during the twelve months of 1890, only five flew the stars and stripes. Not less than two-thirds of the total quantity of grain was carried by British ships. Again, three thousand three hundred and eighty-nine steamships passed through the Suez Canal in 1890, of which two thousand five hundred and twenty-two were British, but only three American. Nevertheless, America is awakening from her Rip van Winkle slumber, and patriotic politicians are briskly bestirring themselves to remove this reproach. She has now thirty sailing-ships between two thousand and two thousand five hundred tons register, and two of over three thousand tons. They are all wooden vessels, with one exception, the *Kenilworth*, an iron ship built on the Clyde. Protective restrictions do not admit of foreign-built vessels being placed under the American flag unless and until a sum of money be spent upon them which shall exceed the price paid for them on transfer to American owners. The *Kenilworth* was burnt in port, bought for a small fraction of her first cost, and almost rebuilt. America, however, has a few smaller ships built of iron in home yards. Quite recently President Harrison expressed a wish not only for more American war-ships to cheer his countrymen resident in far-off lands, but also 'that in those ports, so long unfamiliar with the American flag, there should again be found our steamships and sailing-vessels flying the flag we all love.'

The first iron ship has more reputed birth-places than Homer. Both the Clyde and the Mersey claim pre-eminence in this respect. Sir E. J. Robison of Edinburgh designed an iron vessel in 1816 which was not launched till three years later; and it is said that an iron boat was worked on the Severn even as far back as 1787. Steel was not used in the construction of merchant-ships' hulls until 1859. Old salts were not alone in their belief that wood was meant by

Providence to float, but iron to go to the bottom. A naval constructor of some repute said: 'Don't talk to me of iron ships; they are contrary to nature.' Now none but small craft are built of wood in this country.

The Mercantile Marine List for 1891 shows that one hundred and thirty-three British sailing-ships each register between two thousand and two thousand five hundred tons, twenty between two thousand five hundred and three thousand tons, and one leviathan of three thousand three hundred and thirty tons!

Shipbuilders' yards were well distributed around our coasts when wooden ships were in vogue; but now that iron and steel ships have come to the front, there is a tendency to congestion. A trip down the Clyde affords an excellent object lesson on the concentration of iron shipbuilding yards. We have somewhere seen it stated that a greater number of new ships are launched from the shipyards along the banks of that river than from the whole of the yards on the Continent of Europe. And this, although the Clyde yards are not so favourably situated as those of the Tees, the Tyne, and the Wear, because those rivers flow through districts abounding in iron and coal. Scotch shipbuilders early evinced far-seeing enterprise, by readily undertaking the building of iron ships when their future was an unknown quantity. Nevertheless, it may be urged that other industries compensate the dwellers along the banks of those rivers. Of the one hundred and fifty-four huge sailing-ships referred to above, we find that sixty-two were built on the Clyde; twenty-six at Southampton; twenty at Liverpool; fourteen at Belfast; six at Whitehaven; five at Stockton; five at Nova Scotian ports; four at Workington; two each at Aberdeen, Dundee, Southwick, and Sunderland; one each at Leith, London, Nantes, and one at Boston, United States. There is, however, a somewhat different geographical disposition of the owners of these large ships. Eighty-one belong to Liverpool, forty-one to Clyde ports, thirteen to London, six to Belfast, five to Nova Scotian ports, four to Dundee, two to Aberdeen, one to Dublin, and one to Southampton.

The French five-master, *France*, is the largest sailing-ship afloat. She was launched in September 1890 from the yard of Messrs D. W. Henderson at Partick, for Messrs Bordes et Fils, and her dimensions are as follows: length 361 feet, breadth 49 feet, depth 26 feet. Her net register tonnage is 3624, with a sail-area of 49,000 square feet; and not long since she carried an enormous cargo of 5900 tons of coal on her maiden passage from Barry to Rio de Janeiro. Cunning old seadogs shook their heads, and looked as though they could a tale unfold; but the sinister forebodings were not justified by the result. It is always awkward to prophesy unless we know, for she reached her port without mishap after thirty-two days' sail, or within one day of the fastest passage on record. She is square-rigged on four masts, but carries fore-and-aft canvas on the fifth mast, which is far aft. Her masts are only one hundred and sixty feet high; nevertheless, she looks heavily sparred. This leviathan is fitted with a cellular double bottom, and can carry two thousand tons of water-ballast, thus reducing the expense of ballasting to a minimum.

Another large iron ship, the *Nord*, belonging to the same important Bordeaux firm, has safely carried 5000 tons of coal from the Tyne to Valparaiso. Her length is 318 feet, breadth 46 feet, and depth 29 feet. A sister-ship, the *Dunkerque*, was also built on the Clyde; and should the French Bounty Law be further prolonged, the firm proposes to have another five-masted sailing-ship built which shall be capable of carrying seven or eight thousand tons of cargo! An auxiliary engine fitted in the after-part of this colossal sailing-ship will provide against calms, and enable her to dispense with tugs when making port. In passing, we may mention that auxiliary engines have hitherto been more costly than useful.

The largest British ship is the *Liverpool*, of 3330 tons, built of iron by Messrs Russell & Co. on the Clyde. She is 333 feet long, 48 feet broad, and 28 feet deep. Her four masts are each square-rigged; but she is far from clumsy aloft, is easily handled, and has run fourteen knots an hour for a whole day. We were much impressed by her exceptional size; but for beauty she compares unfavourably with such a ship as the *Thermopylae*, or a large wooden-built ship of America having bright lofty spars, and decks as white as a hound's tooth. Iron decks do not lend themselves readily to adornment. Next in size is the *Palgrave*, of 3078 tons. The United States' ship, *Shenandoah*, of Bath, Maine, built by Messrs Sewall & Co. of that port, is the largest wooden vessel in existence. She is 3258 tons register, and will carry about 5000 tons of heavy cargo. She has just left San Francisco, California, with 112,000 centals of wheat, worth 175,000 dollars. This is the largest grain cargo on record. Another wooden vessel, the *Rappahannock*, also built at Bath, Maine, is 3053 tons register, cost 125,000 dollars; and 706 tons of Virginia oak, together with 1,200,000 feet of pine-timber, were used in her construction. The largest British wooden ship is the *Three Brothers*, of 2936 tons register, built at Boston, United States, in 1855. She is 323 feet long, 48 feet broad, and 31 feet deep. A further conception may be formed of the carrying capacity of such ships when we mention that the *Liverpool* brought 20,000 bales of jute from Calcutta to Dundee, and the *Rappahannock* took 125,000 cases of petroleum from Philadelphia to Japan.

Large ships were not unknown to the ancients, and some of the most roomy attained dimensions equal to ships of modern times. Nevertheless, they were unmanageable monstrosities, almost at the mercy of wind and wave, and utterly unfit to cope with the fury of a hurricane. Doubtless, we are indebted to travellers' tales for the detailed descriptions that survive the lapse of ages. Constantius conveyed from Heliopolis to Rome an obelisk weighing fifteen hundred tons; and in addition to this long-coveted monolith, the ship carried about twelve hundred tons of pulse, stowed about the smaller end of the obelisk, in order to bring the ship on an even keel. In 268 B.C. Archimedes devised a marvellous ship for Hiero of Syracuse. Her three lofty masts had been brought from Britain; whereas our ships' masts are of iron, or obtained from New Zealand or from Vancouver Island. Luxuriously fitted sleeping apartments abounded, and one of her

banqueting halls was paved with agate and costly Sicilian stone. Other floors were cunningly inlaid with scenes from the *Iliad*. Stables for many horses, ponds stocked with live fish, gardens watered by artificial rivulets, and hot baths, were provided for use or amusement. Ptolemy Philopater, possessed a nuptial yacht, the *Thalamogon*, 312 feet long, and 45 feet deep. A graceful gallery, supported by curiously-carved columns, ran round the vessel, and within were temples of Venus and of Bacchus. Her masts were 100 feet high; her sails and cordage of royal purple hue.

Probably the largest vessel of remote ages was one belonging to the same ruler. She was 420 feet long, 56 feet broad, 72 feet from the top of her prow to her keel, and 80 feet from the highest part of her poop. Her largest oars were 56 feet in length; she had two prows, two sterns, and seven beaks or rostra. On both poop and prows were figures of men and of animals fully eighteen feet high. Her crew consisted of 4000 oarsmen, 3000 soldiers, and several hundred of other ranks. Sesostris is said to have had a ship 400 feet long, which was covered inside with silver and outside with gold. This story causes the adventures of Baron Munchausen to pale into insignificance.

THE CHINCH BUG.

OUR American friends use the term 'bug,' as we know, in colloquial speech to denote any insect; but the subject of this paper is quite entitled to the name, inasmuch as it belongs to the same family as the highly disreputable insect which in this country is pre-eminently distinguished by it.

The Chinch Bug is a modern celebrity; it is only during the last ten or fifteen years that it has become generally known even in America; while in this country its name is still unfamiliar, and—for itself—we do not wish that it should become a common acquaintance. In the United States it is now well known. It has been the subject of numerous newspaper articles and Reports; and the Government has done it the honour of allowing the State Entomologist to devote special bulletins entirely to it. It was even the subject of a 'convention'—The Chinch Bug Convention—held in the city of Windsor (Kansas) in 1881. It is, in fact, what the authorities call a 'first-class insect;' but the high rank assigned to it, and the eagerness with which its movements are watched and reported upon, are due neither to beauty of form, colour, nor any personal attractiveness, but to the fact that it has proved itself specially destructive to the grain-crops. It is a first-class ill-doer; so at least thinks the American farmer, and, as we must allow, not without good reason, when we learn that its ravages in the course of a single season involve a loss measured by millions of dollars. No doubt the chinch bug has its uses, though these are not at present very apparent. Possibly one of them may be to stimulate the energies of the farmer, by taxing all his resources of intelligence in the effort to circumvent the enemy—as was suggested by Professor Riley for

the encouragement of the agriculturists of California, in relation to certain other insects which had proved very troublesome to the fruit-growers of that State.

The chinch bug is a very small, innocent-looking creature. When full grown it is little more than one-eighth of an inch in length. It has not even jaws wherewith to bite. How, then, can it do so much harm? The mouth is furnished with a tiny apparatus for piercing the stalks of grain in order to suck their juices. Now, the damage which one, or a hundred, or even a thousand, of these minute creatures could do would be quite insignificant; but when we get the combined destructiveness of myriads, the results may amount to a national calamity; and a country, rich, even as America, and endowed with the wonderful recuperative energy of youth, cannot afford to ignore an enemy which in a single year may cause the loss of produce which has been officially valued at one hundred million dollars.

The earliest record of the chinch bug dates back little more than a hundred years, to 1783, at the close of the War of Independence, when it was mistaken for another insect pest, the Hessian Fly, which about the same time began to attract attention. It was not, however, till the year 1831 that the first scientific description of the insect was given by Mr Say, the naturalist, 'from a single specimen collected on the shore of Virginia.' At various times since the first mention of it in 1783, it has appeared in great numbers in different localities in the States, though in earlier times the area of its operations was generally more limited. Its rapid increase in recent times is in part accounted for by the greatly extended cultivation of its favourite foods, wheat and Indian corn or maize. These it prefers; and on these it flourishes and multiplies. Next in its favour come barley and oats; and, failing these, it will have recourse to the grasses, which must have supplied food to the family before the cultivation of cereals yielded a more luxurious dietary.

The chinch bug has at times done considerable damage over a limited area in the south-eastern States, so much so that in 1809 the cultivation of wheat was abandoned in North Carolina for two years. Some thirty years later the chinch again mustered in force in the same region, threatening the almost total destruction of the crops; but the disaster was providentially averted by a very wet season.

The chinch bug has also been found in the State of New York; but, happily, there is little prospect of its becoming a source of danger in any of the New England States. Within the last three or four years, its appearance in California has occasioned alarm; but so far it has not caused serious injury there. The region in which it exerts its most destructive sway comprises, according to the Report for 1887 of Mr Dodge, the statistician of the Agricultural Department, the whole or portions of certain States bordering the Mississippi and the Lower Missouri—Kansas, Missouri, Iowa, Illinois, and parts of Nebraska, Wisconsin, and Minnesota. Mr Dodge further states that 'in the area of their depredations the crops have an annual value of more than a fourth of the entire agricultural produce of the United

States.' According to the same authority, the estimated loss of corn, wheat, and oats in nine States in the year 1887 was in round numbers 79 million bushels of corn, 29 million bushels of wheat, and 19 million bushels of oats—a grand total of 127 million bushels destroyed by these insignificant insects. Well may they be reckoned first-class depredators!

When harvest is over and the cold weather comes and no more food can be obtained, the chinch prepare to pass the winter in sleep. They seek out suitable crevices and crannies under heaps of rubbish, corn-stacks, fences, and like places, which seem to promise safe and comfortable retreats. The amount of cold which they sometimes endure is surprising. Dr Shimer mentions having thawed chinch bugs out of grass-stalks, and corn-husks, in which they were solidly frozen; and yet, when set free from their icy bands, they quickly revived, apparently none the worse for the cold. Very cutting winds, with the temperature fifteen or twenty degrees below freezing-point, have, however, proved trying to even their much-enduring vitality, and under such conditions many, whose winter-quarters were not sufficiently sheltered, were found to succumb. With the warm spring days they wake up and turn out of their hiding-places in search of food.

The eggs for the first brood are laid early in spring, usually underground, on the roots of their food-plants; but sometimes on the stalks, the latter being apparently chosen when the ground is very wet. The eggs are deposited in little clusters, and as we are told that one bug will lay five hundred eggs, and that there are usually two broods in a season—possibly in some cases even three broods—we need not be surprised at their rapid increase. The eggs are hatched in about a fortnight, and the young larvæ immediately set about feeding on the delicate spring wheat. Without food, they could not live or grow; and they do not fail to use the means for promoting growth, for they eat voraciously. So fast do they grow, that, as with other larvæ, the body outgrows the skin, and the old one has to be cast to give place to a larger coat. This is moult number one; then other moults follow at intervals; and at last, the larva has attained its full size. The colour changes with its successive new dresses, from pale yellow with orange markings, through various shades of red with yellow markings, to the duller shades which predominate in the mature larva. It then passes into the second or pupa stage; and finally is transformed into the full-grown winged insect, with blackish body and white wing cases, marked with a dark spot. The length of the insect is less than three-twentieths of an inch. By July or the beginning of August, the first brood has attained maturity, and in its turn it produces the same year a second brood.

Although the chinch bugs are provided with wings, they rarely use them. Only once or twice in the course of the year do they take flight, and never to escape threatened attack. Dr Shimer reports having tried several experiments to induce them to use their wings, but quite unsuccessfully—shaking the corn-stalks, beating them with branches, treading them under foot—nothing of the kind would make them rise into the air, though they have been known to do so when driven by starvation to search for fresh pastures.

Even then they prefer to travel on foot. In these migrations, vast hordes move from field to field.

Professor Cyrus Thomas, in *Bulletin* No. 5 of the United States Entomological Commission, devoted to these interesting pests, has pointed out that wet is very injurious to their health and constitution, and that two successive dry seasons are necessary for their development in really formidable numbers. Dr Thomas is able to hold out further encouragement to the farmer. He has studied the rainfall for a number of years, and finds a tendency to recurring climatic conditions in seven-year cycles. He believes that there is no danger of more than two chinch-bug years in every seven, and further, that no two are at all likely to be in succession. Then he goes on to point out that the farmer, by using these facts as a basis, guided by further observation, may take measures to defeat the enemy by cutting off his supplies. When a season has been dry, and there is evidence that the bugs are numerous, let the farmer sow some other crop than wheat or corn. In any case, let him avoid spring wheat. Winter wheat fares better, for it has acquired strength before the enemy attacks it in great numbers.

For the destruction of the chinch bugs when they are already in force, various means have been proposed in official and other publications by Professor C. V. Riley, Dr Thomas, Mr Howard, and other entomologists. A few of these may be briefly indicated. Make a trench in the line of advance, into which they will fall, cover up, and burn them. Set a fence of tarred boards in their way. Plant a strip of land with an agreeable food around a field so as to protect it. Plant a disagreeable crop in the same way and for the same purpose. Intermix with the crop to be protected small quantities of a distasteful plant (for example, flax amongst wheat). Treat an affected section of a field—(a) with hot soapsuds, or (b) with kerosene. Lay traps for the bugs by placing around infected fields a number of flat boards, under which they may congregate for winter shelter; then collect and burn them. Such are some of the methods by which the farmer may seek to protect his crops from the ravages of the chinch.

The chinch themselves have other enemies besides man. Birds, as a rule, will not eat them, as their unpleasant odour serves to protect them; but quails are not so fastidious; and so quails, as the allies of the farmer, are protected more or less in all States where the chinch bugs are, or possibly may be, troublesome. Then there are some insect enemies, though these are not numerous, as even many predaceous insects refuse the unsavoury chinch; but the ladybird, the insidious flower-bug—itsself so like the chinch as to be often mistaken for it—the many-banded robber, the ground beetle, and even ants, do good service in this respect. Nor must mention be omitted of the larva of the lacewing fly, which has a marvellous appetite for chinch. It will attack bug after bug without pausing until it has had a feast of a dozen or so, when it will seek repose in preparation for a fresh onslaught. The chinch are also subject to disease, and sometimes an epidemic rages amongst them, felling its thousands or millions of victims.

So the American corn-grower need not despair.

Various plans of campaign are open to him in his war with the chinchies. He may harass the enemy and weaken its forces before it attacks him; he may carefully guard his outposts, and there make stand against the invader; or, when it has already reached his land, he—as other good generals have had to do—may sacrifice a part to save the rest, and having cleared the surrounding space, he may set fire to the enemy's camp. He may encourage the aid of plunder-loving mercenaries, vertebrate and invertebrate. And lastly, he may use his superior knowledge and skill in devising means to introduce the dire scourge of disease amongst the enemy, though this method of warfare savours of the cowardly, even when directed against chinch bugs.

HOW LIGHTNING IS PHOTOGRAPHED.

ONE of the most remarkable results of the modern advance of scientific photography is the application of the process to objects in rapid motion. Rigid stillness and prolonged exposure are almost unknown in these days of sensitive plates and instantaneous shutters, while half the agony of a visit to the photographer's may be abolished with the head-rest, which formerly reminded one of the tortures of the dentist's chair.

Birds in full flight, horses at a gallop, the finish of the boatrace, the rush of the express train, have all been pictured with unimpeachable accuracy by the greatest of all artists—the sun. The lightning-flash, however, offers a peculiar fascination to the photographer. A certain sense of sacrilege attaches to any attempt to 'take' so awful a manifestation of the mighty forces of Nature, and opportunities are so rarely presented in this country, that the feeling never wears away by familiarity. Three hot days and one thunder-storm are proverbially said to make up an English summer; and should that solitary thunder-storm occur in the daytime, the artist's opportunity is lost.

The problem is to obtain a representation of a vividly bright object some miles in length, which presents itself at uncertain intervals, and remains for an inappreciable instant. The difficulties appear great, but by patience they may be surmounted. Authorities differ as to the time of duration of the lightning-flash; but all agree that it is less than the ten-thousandth part of a second. The experiment which establishes this fact is due to the late Sir Charles Wheatstone. A disc, divided into alternate sectors of black and white, is caused to rotate very rapidly on its axis, and by daylight it appears of a uniform gray. If lightning, occurring in the dark, render the separate sectors visible, it is plain that the duration of the light must be less than the time of revolution through the breadth of one sector. The experiment was tried with a disc of sixty sectors and making one hundred and eighty revolutions in a second, so that the time of turning through the space of one sector is the 10,800th part of a second. When the disc, rotating with this velocity, is rendered visible by lightning, black and white sectors are seen with gray ones intervening. This shows that the flash is not absolutely instantaneous, for in this case the sectors would be seen sharply defined without any alternation of gray.

It is therefore very clear that any attempt to photograph the lightning in the ordinary way by exposing a plate upon a given flash would utterly fail; for we must remember that a most complex muscular and nervous process is gone through before the operator can attain his end. Let us for a moment consider this process, and imagine the artist waiting for a flash with the very best intentions of taking it. A thunder-cloud suddenly darts out a bright streak of light; its image impresses itself upon the retina of the observer's eye, and the optic nerve conveys the impression to the brain. A nervous stimulus is sent to the muscles of the hand, and the mechanical process of removing the cap from the camera ensues. But bodily action occupies time, and long, comparatively, before the sensitive plate is uncovered the flash is only a memory, and has actually vanished before the observer is conscious of its advent. It is therefore abundantly evident that a flash cannot be photographed by the ordinary process except by the merest accident.

But lightning-photography is a very simple operation after all. The whole secret is to wait for the lightning and to let it 'take' itself. The operator knows by previous experiments the exact focal length of his instrument, and so adjusts the camera that all distant objects are in distinct focus. He inserts his rapid plate and turns the lens in the direction whence the flashes come. He then counts the number of seconds between several flashes, in order to arrive at a fairly accurate estimate of the interval after which a flash may be expected. Allowing this time almost to expire, he removes the cap from the lens and awaits his flash. Upon its appearance he replaces the cap, and the operation is complete. The necessity for the darkness of night is readily seen, for if the exposure were made during the hours of daylight, the plate would be hopelessly fogged, should the flash not present itself at the exact moment, and the great advantage of the background of dark sky would be absent.

The most favourable conditions for lightning-photography occur when a thunder-storm happens at night and is accompanied by vivid flashes at frequent and fairly regular intervals.

YOUTH AND AGE.

WHEN Time was young, and the faint golden spears
Of dawn-light stirred the curtains of the deep,
So true our hearts—our wills—the mighty sweep
Of unseen wings had borne us o'er our fears.

But shadows lie upon the folded years—
Dim shadows of a twilight that must creep
And creep, until forgetfulness and sleep
Round in our world, kissing its doubts and tears
Into a dream; and gathering the old,
Old memories as a reaper, who among
The fair rough hillocks of his harvest gold,
Would leave the withered blossoms that are sprung
From the rich soil of youth, and must unfold
The fragrance of their hope while Time is young.

THE ETHICS OF PRIDE.

OF the seven deadly sins, perhaps the most universal is Pride. It has been called the child of Ignorance; and as ignorance walks always in darkness, and therefore in danger, the probability of pride getting a fall is proverbial. It is wonderful on how small an amount of sustenance pride often subsists, how infinitesimal is its tap-root. Like the old lady who mended stockings with such perennial assiduity that at last she darned upon nothing as a substratum; so those who have little or nothing to be proud of in their lives lay a substratum of pride, and proceed to be proud—of being proud.

But although every one allows pride to be a sin, and a deadly one, very few will be found to resent the imputation of indulging in it. Why is this? Perhaps few allow it as the offspring of ignorance, yielding it a more powerful parentage. And as the Prince of Darkness is a gentleman, they perhaps regard his especial vice as, at least, a gentlemanly one. Certain it is that pride has a profound fascination for two classes of minds: for those, namely, who are deficient in courage and in judgment. Those who are deficient in courage admire the audacity that dares to be proud and show its pride; while those who are deficient in judgment imagine a proud man conscious of his intrinsic worth, and therefore proud of it. This of course is an error of judgment; for oftentimes the really mean man, the man conscious of his own meanness, assumes the port and armour of pride just to conceal the feebleness of his deservings. Moreover, proud men, men of whom it might well be asked, why, in the name of Glory, they were proud, have been known to plan and execute the most treacherous, mean, and cowardly murders, in order to prevent a member of their family forming an alliance distasteful to their family pride. Thus, the two brothers 'with their murdered man' rode past fair Florence, their pale faces intent on taking their destined victim at a double disadvantage; and

so, to preserve their pride of race and ancestry, they 'damned themselves to everlasting infamy.' Thus pride and meanness but too often go hand in hand; and the man who for long years has had a subordinate place, has been compelled to yield precedence, and if he has been mean as well as proud, has been a sycophant as well as a subordinate, will, when opportunity offers, take a prideful revenge on those whom most he has formerly flattered. We may be sure that Goneril and Regan would not have treated the 'old kind king' with such disdainful cruelty, had they not first fawned on him with such servile adulation.

But pride is of many species, and bewrays itself, or exposes itself, or fantastically disports itself, in a thousand protean shapes. Now it pours transparent contempt on that which secretly it covets, as in the case of the would-be Lord Mayor, who, not being elected, discovered his chagrin by declaring, with unnecessary candour, that 'for his part he would rather wear the white robe of righteousness than the red rag of office.' Or it exposes itself to a pitying derision, when, as in the apologue of the cobbler's dog, it prefers to be crushed rather than move out of the way. Or it fantastically disports itself, adorned with infinite pains and trouble, in the latest fashion, to 'astonish the Browns,' or win a stare from a casual passer in the Park; and flatters itself that, like Mr Bob Cratchit, junior, it 'is not pride, although his collars nearly choke him.'

Some are proud of their diamonds; yet, if the deeds that have darkened the struggle for their possession could be written legibly on their facets, their owners would shrink from them with horror. Have not the finest and largest been the incentives to the vilest crimes? Eyes that have gloated on them in Eastern lands have been torn from their sockets by rapacious wretches eager to obtain a transitory possession of the enthralling baubles; while in the West, a Countess, subdued by the fascination of their glitter, has stolen them, hoarded them for years, to wear

them for one evening, have her guilt detected, and die, a broken-hearted exile from her native land, leaving a legacy of shame to her children's children. In the hands of a crazy Cardinal they were powerful enough to half ruin the reputation of a hapless Queen. In short, if they were but as ugly as they are intrinsically useless, or if their power to awaken evil passions were only as patent in its effects as are those of other stimulants to vanity and self-love, instead of being sources of pride, they would be no more regarded than the carbon of which they are composed.

Possibly it is true that no man is a hero to his valet; and this not because the hero is not heroic on a near view, or because the valet is valetish; but, at anyrate, if we cannot or can hardly be heroes to those about us, we wish to be heroes to ourselves; for all the ways of a man are clean in his own eyes, says the proverb; and so pride is about the last hindrance to common-sense which a man is willing to surrender. For instance, it is with difficulty that he will own that he is not so well off as he was: his pride is reluctant to confess itself in any way beaten in the race of life; so, instead of quietly acknowledging and acting upon the fact of narrower means, there pass years of a wretched compromise with conscience, ending very likely in a poverty which a timely retrenchment might have parried; or in disgrace, and sometimes in suicide.

There are many too proud to wait on themselves, who nourish a Spanish pride in laziness, to whom 'anything menial'—that is, done with the hands—is anathema maranatha; and again there are others too proud willingly to let others do for them what they can do for themselves. To these last, the weakness of disease or of old age is a very bitter draught; so bitter, that here and there one will throw aside the cup of life altogether rather than submit—not to weariness and pain so much as to the sense of personal humiliation and degradation. How many a man, alone, aged, and infirm, has had the thought to which Carlyle in his lonely old age gave utterance: 'What I want is a mother!' To no one else but to the one whose arms cradled him in infancy could the once strong, proud man, the now weak but still proud man, confide the bitterness of his old age and infirmities.

Pride of birth and of blood, when a race is renowned for virtue as well as antiquity, is a pride few will quarrel with; nevertheless, it behoves one endowed with such advantages to beware that he is not remarked for his degeneracy. Pride of intellect, too, is one freely admitted, perhaps because all know the brittleness of the foundation: a fever, an accident, a knock on the head even, and the towering intellect is on a level with the lowest. It is, moreover, the use that has been made of the power in its strength that entitles a man of genius to the consideration of his fellow-men.

But there is a pride that can dispense with the help of ancestry. Napoleon I. was too proud to care whence he came; his exaggerated egotism swallowed a kingdom, and, like Louis XIV., gave it out again as himself: '*L'état, c'est moi.*' A genealogical tree, however far-reaching, scarcely sufficed to bring its owner up to his level. Again, the swelling personal haughtiness of a Wolsey needed no pride of race to place the butcher's son before his master; even though that master was a king, he must come after His Eminence; and the superscription of the medal must run, '*Ego et rex meus.*'

As for a man whose pride is in his money-bags, who worships a golden idol—why, as,

Golden lads and girls all must,
As chimney-sweepers, come to dust,

as he cannot take his treasure with him, we hardly grudge him his miser's joy, knowing it to be miserable. Personal adornment—to go fine—is, after all, but a peacock sort of pride. Stars and Garters, Orders and Crosses, are but horses' bells, which the animal pines for because they have been given him by his master, man; and some men there are to whose happiness they would not add, for they do not own a master—on earth.

But if pride of laziness be ignoble, and pride of wealth be, as Dr Johnson called it, 'a wretched thing,' and pride in trifles—such as Cardinal Chigi's pride in making a pen last three years—be trivial, there is another kind of pride that is neither ignoble, nor wretched, nor trivial, and this is the pride of usefulness. It is not so much a question whether the thing to be done is a great thing: it does not fall to the lot of many of us to do great things, perhaps; it may be only a rick to be thatched; it may be a great business to be successfully carried on. But whatever it is, if good true work be put in it, a man has a right to be proud, modestly proud of it; and if it be successful, he has a right to the self-reliance, the self-confidence, which are the legitimate fruits of his exertions. This noble pride is the twin-brother of Self-respect; it will never permit him to be arrogant to a subordinate, still less will it allow him to think unfairly or ungenerously of one above him; for by so doing he would spoil his nobler soul. This is the pride that will not allow a man to tell or act a lie; to slander, nor listen to a backbiter. It is as far removed from the cold patrician pride of a Coriolanus as it is from the spiritual pride of a Thomas à Becket. Of all the prides, this last, spiritual pride, is the most dangerous; and for this reason—no man, even the proudest, can quite forget that a cold '*Hic jacet*' is the destined epitaph on all his pride and power, his pomp and circumstance. But the spiritually proud, the self-elected saint alone ventures on a '*resurgam*' for his pride—it does not find a resting-place even in the grave.

We have said that people with little else to be proud of will grow proud of their own pride. We will conclude with an anecdote illustrative of this curious tendency in the human mind to exalt pride for its own sake. 'People say,' said

a lad at Eton to his haughty and rebellious fag—'people say, "As proud as Lucifer;" but if Lucifer was half as proud as you, he'd have something to be proud of.'

A SOLDIER AND A GENTLEMAN.*

CHAPTER III.—DREW, DAWLISH, AND DRUMLY.

FERRERS walked away in a whirl of pleasant feeling. He put his hand into his pocket: it was long since—and it had not been often—he had felt the crisp touch of a bank-note. As he strode along, scarce knowing where he went, he thought he would like to smoke. He was tired of the old clay he carried in his pocket. He had money: he would buy a new pipe. He threw his clay away and ventured into a tobacconist's. It was only when he was in that he remembered it would be next to impossible for him to change a five-pound note that night in the region he frequented. He bought a pipe, however, nominally a briar, which was within the range of his remaining cash, and continued on his way. He wandered on; in his exaltation, not quite perceiving where he was. It was still tolerably early, and many shops were still open. In passing a cheesemonger and buttermilkman's he remembered that he had no butter for breakfast. He had his foot within the shop before he discovered that he had only twopence in his pocket. He thought, 'I can get two ounces'—a quantity he had often heard asked for in his Soho region.

'Two ounces of your best fresh,' said he, walking up to the counter.

'We don't make two ounces,' said the young man, looking at him suspiciously.

'Don't you?' said Ferrers, and with a blush he was ready to turn away when he remembered Lord Debre's advice: 'You must come the old soldier; you must bounce.'

'Then,' said he, recovering himself, 'weigh me a quarter of a pound.'

The shopman weighed that quantity, placed it on paper, and was about to wrap it up, when Ferrers proffered a request. 'Will you be so good as lend me a knife?' quoth he.

'Certainly,' said the shopman, handing him a formidable carver.

'Allow me,' said Ferrers, and drew the butter towards him. In a second he had cut the quarter in two with the knife, put the one part back on the scale and wrapped the other in the paper.

'Just to show you how to make two ounces,' he added, putting down his money and striding leisurely out under the astonished stare of the shopman.

The complete success of his device surprised and amused him. 'That,' he thought, 'is evidently the way to do it. Don't make a fuss, but don't be put down. I see.'

So he marched away to Soho in a meditative mood. He had not yet had time to take in completely that which had happened to him. He was to call himself 'William Dawlish' and to appear as a gentleman. What could that mean? That he was going to be adopted by Sir William? Scarcely. The grinning baronet was not the man to have generous impulses of that sort. He was

—unconsciously, he supposed—to perform some service—of an important kind, or else the baronet would not have offered him so much money and would not have been so secret. There was a lady concerned. He wondered what *that* might mean. Was she young or old or middle-aged? Was she maid, wife, or widow? He perceived, however, that if he indulged in such speculations on every hand he would probably spoil his business. He resolved that he would keep his mind—for the present at least—off these things, and set himself to execute to the best of his ability the purpose for which he had been engaged.

'Call yourself William Dawlish, and behave as "sech." That's all.' Yes; that was all. He had got but a line or two by way of a sketch, and he had to fill in a complete picture. Well, the best and the most he could arrange now was to keep his head cool and his wits awake and to tackle difficulties as they arose. So he went to bed and to sleep.

When he woke in the morning he reflected: 'Yes; I'm William Dawlish, and I must behave as "sech."'

William Dawlish, it was clear, must be quickly cut off from the associations of George Ferrers. So, when he had eaten his breakfast, he called his landlady and told her that he must go away at once. She was sorry: he had been such a 'nice quiet gentleman.' He owed the old woman nothing—his room being paid for—but he felt something was due to her for her expressions of politeness. He asked her to get him his five-pound note changed, the more readily that in his experience such a document could not be cashed either at shop or public-house without the portentous formality of putting your name and address on the back. She brought him the change, and he begged her to accept a shilling.

'Oh, thank you, sir,' said she, with a little duck of her person, which was rather like the memory of a curtsy than a curtsy itself.

With such deference paid him, Ferrers felt as if he were already William Dawlish, though still in the dingy garret in Soho. He said, 'Not at all,' and began packing away his belongings in his carpet-bag. That occupation accomplished, he said 'Good-bye' to his landlady and descended the stairs. As he was departing from the doorstep, he gave a quick glance back at the house, asking himself of a sudden whether that was the end of his poverty, or whether he might have to return to the frowsy garret he had left, or at least to another like it. Of course, he would prefer not to return; but if it were decreed that he should—well, he was not going to worry. Fortune's buffets and caresses he could bear with the same equal mind.

He had resolved what he would do first. He must array himself like a gentleman, and he had in his mind's eye how his friend Lord Debre dressed. Sir William expected him to appear at twelve o'clock with a goodly portmanteau, in which he meant, no doubt, that there should be a goodly store of proper clothing. He could not get an outfit and a portmanteau with five pounds; but he knew of a well-filled shop in a quiet street where misfits from fashionable tailors were sold at a reasonable price, and where, he believed, he might buy at once a proper suit to stand up in and also a sufficient portmanteau. Now, what

[* Copyright reserved in the United States of America.]

kind of suit should be his first? Sir William had abstained from explanations and directions; but was it not plain he desired him to appear as if fresh from a journey? On entering, therefore, the shop of misfits, he demanded a travelling suit of serge or tweed. He tried several, for, being a tall fellow, he was not easy to fit. At length he decided on a fine serge, which he asked to be allowed to put on. Before, however, withdrawing to the back-room pointed out to him as the place where he might effect a change, he turned to the shopman. 'I want a portmanteau,' said he; 'large and good, but not too new. You have such things, haven't you?'

'Oh, yessir,' said the man.—'Now, here's a fine solid-leather article; we bought it of a gentleman going to India. That ought to suit you to a "T."'

'Yes,' said Ferrers. 'But here's another that will do for me, I think.' He had determined on it because it bore two large initials, 'W. B.'—the latter of which he saw at once could be readily changed into a 'D.'

'Yessir,' said the man, 'that's a very serviceable article; but it's not so good as this.'

'It will suit me very well,' replied Ferrers, 'if you will get that "B" changed into "D." Rub that middle bit out and round off the back. Can you do that at once?'

'Oh, yessir.'

Ferrers withdrew to the little back-room to change his clothes. That done, he put his head out and demanded a new hat—a brown one, round and of hard felt.

'Is that portmanteau ready?' he asked.

It was—almost. When it was, he requested it to be set down in the little room.

'I want to put in these things I've taken off,' said he.

He not only folded in the things he had taken off, but also crammed in his carpet-bag and all its contents, thinking that simplified matters a little. Then it occurred to him that, since he was supposed to have made a journey, he ought to be provided with some sort of overcoat. He had not, however, sufficient money left for that; so he had reluctantly to forego so complete a presentation of his part as he thought he ought to make.

'I ought really,' he also thought to himself, 'to take a cab from some station, and there should be labels on my portmanteau; but I suppose these things can't matter.'

A hansom was called for him, his portmanteau was hoisted up, and he got in, saying to the driver: 'Drew, Dawlish, and Drumly's Bank in Lombard Street.'

When the bank was reached, he told cabby to wait, and descended to undergo his first ordeal. He remembered that Sir William had said with a grin that he might be 'detained' at the bank; and with it, it must be confessed, a curious heave of feeling that passed from his ample chest down to somewhere about the second button of his waistcoat, he wondered what was going to happen. He was not afraid; but he thought, 'What if the whole thing should end here? What if somebody should say, "You're an impostor!" and send for the police?' And with a glance back at the cab, he wished he had taken it from some station; for would it not betray him if cabby

were questioned and answered truly where he had driven from?

He entered the bank as carelessly as he could, and walked up to a part of the counter whence he saw the word 'Cashier' staring roundly. He took out his purse to produce the cheque, and was at once smitten with chagrin to think that his little purse looked shabby, and that the cheque should have been taken from a well-filled pocket-book with gilt initials or monogram on the back. He was relieved to note that nobody seemed to remark from what he took the cheque, that no one took any notice of him till he leaned on the counter and drummed with his fingers. Then a bald-headed man—a disconcerting man, who looked at him as if he had known his father and grandfather and remembered all the peccadillos of his youth—looked round from a desk where he sat over an enormous book, and held out his hand without a word. Ferrers gave him the cheque. He looked at it on the front, glanced at its blank back, and then got down from his stool and looked straight at Ferrers. 'Mr Dawlish?' said he in a sepulchral voice of inquiry.

Ferrers inclined his head a little, scarce knowing what to do.

'Will you wait a moment, please, Mr Dawlish?' said the man, and disappeared.

What next? thought Ferrers, with another flutter beneath his waistcoat. He looked about him, curled his fine moustaches, and tried to look unconscious of evil. Presently he became aware that some one was looking at him very hard through a glass partition a little way off. What now? He was surprised by the appearance, through a door in the glass partition, of a good-humoured, dapper, little old gentleman, who came straight up to him with a winning smile and the inquiry he had already heard from the bald-headed man—'Mr Dawlish?'

Again Ferrers bowed in reply—this time a little more resolutely.

'Dear me!' said the little gentleman, looking his stalwart person up and down. 'And how are you?' he asked heartily, extending his hand, which Ferrers took and gripped. 'Dear me!' he exclaimed again, glancing at his soft white hand, when released from Ferrers' vice. 'Will you step into this room?'

'Will you walk into my parlour?' thought Ferrers with a new sinking of heart.

'I wish I knew,' he said to himself, 'whether there's a real William Dawlish—and what he is and what he's like!'

He entered the back parlour with the dapper little gentleman, and found himself face to face with another person, who looked so ugly and surly, so silent, so watchful, and so overgrown with hair, that it was difficult to decide at a glance whether he was an old man or a gray gorilla.

'He must be the spider!' thought Ferrers. 'Now for it! But he'll find me a big fly to tackle!'

'My partner, Mr Drumly,' said the dapper little gentleman with a flourish of his white hand. 'And I'm Mr Drew, at your service. Be seated.'

Mr Drumly said nothing, but looked a great deal from under his shaggy brows. Ferrers sat

in an attitude of expectation, determined not to commit himself.

'I hope, Mr Dawlish,' said Mr Drew, a little uneasily, 'that we're not detaining you?'

'My cab's waiting,' said Ferrers; 'but that's of no consequence.'

'The fact is,' said Mr Drew, in a little burst of confidence, 'that Sir William has overdrawn a leetle bit, and the cashier brought your cheque to us.'

'I'm sorry,' said Ferrers, 'that it's not all right.'

'Not at all,' said Mr Drew; 'we'll make it all right. Glad on the whole that it has happened, since it has introduced us to you.'

'Is Sir William very well?' asked Mr Drumly, speaking for the first time, and in a voice that sounded to Ferrers like the buzz of a blue-bottle in the toils of a spider.

'As far as I know,' answered Ferrers.

'You are looking well,' came from Mr Drumly, and there was a lifting of the heavy gorilla brows that seemed to suggest that a smile was hid somewhere under the abundant hair.

'Thank you,' said Ferrers; 'I am well.'

'Mr Drumly, you know,' said Mr Drew, with an indulgent smile towards his partner, 'goes in for Health; he believes in it; it's a creed, a hobby, with him.'

'Health,' said Mr Drumly, and the buzzing of his voice was then very loud indeed, 'is everything. It is better than Wealth; it is better than Rank. With Health a man may do anything; and with *fine* Health'—

'And Honesty,' suggested Drew (while Ferrers wondered if there was any suspicion of his honesty).

'And Honesty,' continued Drumly, accepting the suggestion with a little gruffness, 'a man is the most god-like creature under the sun.'

'He is; he is,' said Mr Drew, looking at Ferrers with approval, and running his eye up and down his stalwart person.

Ferrers stretched out his long legs, leaned back in his chair, and expanded his chest, to give the full effect of himself.

'Yes; a healthy man that has a fine, well-grown figure and an honest heart,' repeated Mr Drumly, 'is the Royalty of Manhood.'

'Like Saul, you know,' said Mr Drew.

Ferrers forgot who Saul was, but he wondered if he had an honest heart; he scarcely felt as if he had, in the presence of these flattering old gentlemen.

'I suppose so,' said he, by way of saying something.

'You appear,' said Mr Drew, smiling, 'to take your fine health now as a matter of course.'

Ferrers took alarm; had he been playing his part improperly?

'Well,' said he, 'you see I've had good health so long that I—I forget'—

'That's only as it should be,' said Mr Drew. 'But you were very queer before you went away, were you not?'

'Yes,' said Ferrers, 'I suppose I was; I dare say I was.'

'But don't you remember?' insisted Mr Drew.

'It is likely he doesn't,' said Mr Drumly. 'Why should he? You forget, Mr Drew.'

'Ah, yes; to be sure,' said Mr Drew.

What could it be Mr Drew forgot?

'And then,' said Mr Drumly again, 'he's been travelling a long while.'

'Yes, of course,' assented Mr Drew. 'Let's see, Mr Dawlish; how long have you been away altogether?'

'How long?' repeated Ferrers. Yes; how long had he been away? That was a poser! 'Let me see,' he murmured, curling his moustaches in a whirl of perplexity.

'A matter of two years, I should think?' suggested Mr Drew.

'Yes,' said Ferrers, eagerly seizing the suggestion; 'that's about it.'

'And you went straight off to the East, didn't you?'

'Yes,' said Ferrers, pulling his self-possession together; 'to the Mediterranean and the East.'

'Did you happen,' asked Mr Drew, 'to see anything of the Egyptian trouble?'

Now Ferrers felt he must make a direct statement: he must risk it, and let Sir William know what he had said. 'Oh yes,' said he. 'I was in most of it—up the Nile and across the desert with the Desert Column.'

'Were you, indeed?' exclaimed Mr Drew. 'But I thought you had left the army long ago?'

'Ah, yes,' said Ferrers; 'but they let me serve as—a volunteer, you know.' There seemed to him nothing for it but a plain falsehood; and being in for it, he continued: 'I was by the side of Lord Debrett all the time.'

They were interested: and they put to him several questions which he was, of course, able from his actual experience to answer sufficiently and categorically. They were clearly pleased with him, and his self-confidence was completely restored.

'I fear,' said Mr Drew at length, 'that we have trespassed terribly on your time. But you will excuse us. We have been very glad to make your acquaintance, and we hope we shall meet again soon.'

'I hope we shall,' said Ferrers heartily: he liked the old men, for he was leaving their presence pleased with himself.

The cash of his cheque had already been placed ready for him, and he took it and departed. He was about to step into the waiting cab, when Mr Drew appeared at his side and hastily laid his hand on his arm. He was invaded by the sudden thought that he was found out.

'Excuse me,' said Mr Drew; 'but will you give me your address? We may want to communicate with you.'

'To be sure,' said Ferrers. He put his hand to this pocket and that. 'I have not a card about me; but Number —, Jermyn Street, will find me for some time.'

'Ah,' said Mr Drew; 'the same address as Sir William's, of course?'

'Yes; the same.'

They repeated their adieus, and Ferrers entered the cab. Seeing that it was already more than half-past eleven, he ordered cabby to drive to Jermyn Street.

He was surprised—almost amazed—with his success. He had not imagined he could have so easily got himself taken for granted as William

Dawlish, and by business men, too, who saw all kinds of people and who must be prone to suspicion. He was inclined to be vain. He admired above all things a gentleman like Lord Debre'tt, and it very naturally puffed him up to be taken by strangers for that kind of person.

When he arrived at the house in Jermyn Street, he was shown at once into Sir William's sitting-room on the first floor; for it appeared that the baronet had only lodgings there.

'Well,' cried Lord Debre'tt, who was smoking at the window, 'how have you got on, Ferrers? Have you nobbled the old boys?'

'I think I have,' said Ferrers; and he proceeded to relate, with a subdued glee, how he had been received and entertained with conversation in the bank parlour.

'And didn't they offer you never a drop of their fine City drinks?' asked Lord Debre'tt.

'Never a drop,' said Ferrers.

'Give him a drink now, Debre'tt,' said Sir William with a grin. 'He seems to me to deserve it.'

'And remember, if you please, Debre'tt,' said Ferrers, 'that I was a volunteer in the Soudan.'

There was a knock at the door, and a manservant entered with a note on a tray; it had just come, he said, by hand. Sir William passed it on to Ferrers with a snigger.

'For you, I believe,' said he.

It was addressed to 'Wm. Dawlish, Esquire;' and it proved to be a card of invitation to a dance that very night at the house of Mr Drew, in Park Lane. Ferrers handed it back to Sir William.

'That's quick work,' said the baronet. 'I suppose Drew telegraphed home at once to send the invitation.—You must have fetched him,' he remarked, with a certain look of admiration at the Lifeguardsman's good-humoured face. 'You must go. Can you dance?'

'Tolerably,' said Ferrers.

'Ah, well, then,' said Sir William, 'we'll manage.'

OLD SOUTH-COUNTRY INDUSTRIES.

THE recent discovery of coal in Kent, and the visions it calls up in the minds of the sanguine of a possible transformation of our pleasant, eminently bucolic South Country into the likeness of the pit districts of Durham and Northumberland, reminds us of one of the most remarkable waves of change which have swept over our land during its history—that which transferred its industrial centre from south to north.

To very many people it is news that for many centuries industrial England was almost confined within the limits of Southern England, the western counties of course being included in that designation. There are thousands of people who visit Brighton and Eastbourne and Hastings who have never heard of Sussex iron; just as there are other thousands who would be at a loss to explain the phrase 'Kentish gray-coat.' Yet the Sussex iron industry lasted twenty years after the present century commenced; Kentish woollens were famous at the beginning of the last, and the scale in many a parliamentary election was turned by the votes of the Kentish 'gray-coats.' Nor are these the only south-country industries

of ancient origin which are either dead, or which are reviving after a runaway knock at Death's door. But only two old south-country industries of old date fairly hold their own in spite of northern competition—the Kentish paper industry, and the west-country mining industries.

For some occult reason, and in spite of the general craving for fresh woods and pastures new, the beautiful and interesting county of Sussex is comparatively unexplored by the tourist. Visitors to the coast watering-places or to Tunbridge Wells take drives in the neighbourhoods of these towns; but beyond the radius of the average visitor's drive, the country is absolutely unknown, except to a few who, having unlocked its secrets, keep them sagely, but perhaps selfishly, to themselves. But no man can wander about this *terra incognita* with his eyes open without becoming convinced by sundry signs and tokens that there have been mighty and tolerably recent changes in the world around him. He meets amidst smiling cornfields and tranquil vales place-names which seem utterly out of keeping with the surroundings—names such as Ashburnham, Cinderford, Hammer Pond, and Forgehill. He notes the frequent almost lavish use of iron articles—iron grave-slabs, iron door-steps, and iron fireplace backs. Lastly, he observes amidst quiet agricultural districts, thinly populated and far from large towns, splendid old manor-houses, or remains of manor-houses, such as he can hardly conceive to have been the product even in the best of 'good old days' of mere sales of stock and produce.

He makes inquiries, and he learns for the first time about the once famous Sussex iron industry. He may know his Camden pretty well; but with the interest of entire novelty, he reads the old Elizabethan traveller's remarks about Sussex: 'Full of iron mines it is in sundry places, where, for the making and founding thereof, there be furnaces on every side; and a huge deal of wood is yearly burnt, to which purpose divers brooks in many places are brought to run in one channel, and sundry meadows turned into pools and waters, that they might be of power sufficient to drive the hammer mills which, beating upon the ground, resound all over the places adjoining.'

The Romans founded the Sussex iron industry, remains of their cinder-heaps having been discovered at Westfield and Sedlescomb, not far from Hastings; but, in common with so many other of their institutions in Britain, it seems to have utterly disappeared, not to be revived to any extent until the sixteenth century, although there was iron trade at Lynch, in West Sussex, in 1342; and the oldest specimen of Sussex iron-work dates from the same period. The trade was at its height in the seventeenth century, at which period complaints were frequent about the waste of timber, a circumstance which contributed in no small degree to the final extinction of the industry, although of course the death-blow was dealt by the development of the north-country coal-fields. The last furnace was said to have been blown out at Ashburnham in 1809; but it is discovered that one was in full operation near Rye until 1821.

The metal produced in Sussex at a most extravagant cost of timber for charcoal, and also of

human lives—for the dram-drinking habits of the miners, owing to the facility with which spirits were smuggled from the neighbouring coast, are described to have been terrible—was of very excellent quality. The railings around St Paul's Cathedral were cast at Lamberhurst, which may be considered a Sussex iron centre, although, strictly speaking, it is just over the Kentish border. Here also was a cannon-foundry; but it being discovered that, in spite of frequent warnings, the Lamberhurst people supplied French privateers with guns, the Government withdrew their contracts, and henceforth the famous 'Gloucester Furnace' decayed. There were also cannon-foundries at Heathfield and Buxted, at both of which places the old proof-butts may still be seen, and a large Government charcoal manufactory at Fernhurst, in West Sussex.

Sussex fireplace backs, with their quaint decorations, fetch fancy prices in the curio market; but they are not easily to be obtained; for their owners cling to them with strong affection, and long may they continue to do so. A great many may be seen, particularly in old farmhouses about Mithurst and Warbleton; whilst in the churchyard of Wadhurst alone there are a score of iron grave-slabs.

A few of the old iron-masters' houses may be seen intact; but for the most part they have been incorporated with farm-buildings; and the presence of their stately chimney-stacks, their gables, their mullioned windows, amidst the mean surroundings of depressed agriculture, preaches us a forcible sermon in stones on the mutability of human grandeur.

Of the old Kentish woollen industry, very much fewer relics have come down to us. It originated, like so many other of our national industries, with foreigners, Flemish emigrants commencing it in the reign of Edward III. in that picturesque corner of the county of which Cranbrook is the centre. Here, as at Goudhurst and the 'dens,' were large manufactories of peculiar woollen cloths of a gray colour, which were not only popular in England, but were exported in great quantities to the Continent and the East, particularly to Persia, by way of Aleppo, Bagdad, and the Tigris. Queen Elizabeth is said to have walked for a mile upon Kentish gray cloth upon the occasion of one of her southern 'progresses.' Descendants of those Flemings, refugees from the tyranny of Alva and his bloodhounds, imparted a new life during the sixteenth century to poor old Sandwich, which was tottering to its decay from the silting-up of the river Stour, by settling there and making the town a mart for woollens and serges. The revival was not of very long duration; but it was marked enough to leave very palpable traces not only on the buildings and the nomenclature of the town itself, but in the shape of many words, such as 'deek' and 'polder,' which have become incorporated with the local dialect.

Yet again, at Canterbury, foreigners in the shape of French Huguenot refugees settled after the Revocation of the Edict of Nantes; and in the crypt of the cathedral carried on a considerable cloth industry. There are many French names still amongst the inhabitants of Canterbury; and the descendants of the original settlers still worship in what was the workshop of the

latter. But improvements in machinery and local disadvantages drove the Kentish woollen trade to the north, and Cranbrook to-day is as empty of stuffs as is Worstead in Norfolk, or Axminster in Devonshire of carpets. Another very prominent Kentish industry, but ancient only in indirect descent, is brick-making. Its pedigree is interesting.

North of old Watling Street, between the towns of Chatham and Faversham, stretches a tract of clay country as far as the rivers Medway and Swale, intersected by innumerable creeks and inlets, almost uninhabited, weird, ugly, and unattractive, which is known partly as 'No-man's Land,' partly as 'the Ma'shes.' Over this tract of country extended a vast series of Roman pottery-works—so considerable, indeed, that to this day the banks of many of the creeks about Upchurch and High Halstow are composed almost entirely of potsherds. The ware made at these towns was of a bluish-brown colour; and as it did not lend itself readily to decoration, was principally used for ordinary domestic utensils. This Upchurch ware, as antiquaries call it, seems to have had a great reputation; for not only have specimens of it been dug up so far off as Wroxeter by the Wrekin, near Shrewsbury, and at Cilurnum or Chollerford, on the line of Hadrian's Wall, but have been found across the Channel. This clay has of quite recent years been found admirable for the making of bricks: within a short time vast brick-fields have been opened, the population almost quadrupled, the aspect of the country, the character of the towns and villagers, completely changed, and bustle and noise replaced solitude and stillness. Something like a parallel suggests itself between the fates which have overtaken the old Roman pottery-masters of the Kentish marshes and the old iron-masters of the Sussex Weald. Evidences of a similar character tell us that each industry brought its promoters wealth; for, just as nowadays we moralise in Sussex over the decayed Elizabethan mansion or the tomb of the long-dead Englishman, so, along the banks of the Medway do we trace the villas of the Roman merchant-princes, and unearth their graves on the hills above or along the course of the great Street. Kentish brick-making has succeeded to Kentish pottery. Perhaps Sussex iron may yet be smelted, but with coke instead of charcoal.

Of paper-making, the most flourishing of all Kentish industries, little need be said. Kentish paper, like the proverbial Scotsman and the Newcastle grindstone, is found all over the world, the reason for its excellence being the abundance of spring-water needing no filtration. Paper-mills have studded the banks of the Cray, the Darent, and the Medway since the reign of Elizabeth, although, strange to say, the manufacture of fine paper in Kent is not much more than a century old, the old Kentish paper being of the coarse brown character.

The essentially Kentish industry, however, that of oyster-breeding, must not be forgotten; for, although it is but a shadow of its former self, owing to the competition of cheap molluscs from abroad, the epicure is still true to his old love, and considers that never does Blue Point or Dutchman approach the original Milton or Whitstable native. The Romans exported these

so-called Rutupian oysters—from the great port of Rutupæ or Richborough, whence they were sent—in vast numbers, even to Rome itself; and ever since their day the Kentish native has held its premier position. The Milton and Whitstable dredgers still obey the ancient laws of their corporation, and, like all such communities, are extremely tenacious of their rights and privileges.

The county of Surrey possesses as little of industrial character as any in England; but particular spots in Surrey were once the seats of particular industries which did not spread beyond the limits of these places, and one or two ancient industries still flourish as relics of the bygone days. For instance, Chiddingfold, now the quietest and dreamiest of old-world villages, once possessed not only iron-foundries but glass manufactories, traces of both of which still exist. Haslemere crape was once very famous. All along the banks of the Wey and the Wandle were, in fact still are, paper and powder mills. At Esher there was a brass-foundry; and Croydon was once the centre of the charcoal-making industry. The two essentially Surrey industries of old origin which still flourish are those of market-gardening and of the cultivation of simples, both said to be legacies from Flemish settlers. Upon the Surrey market-gardens the southern districts of the metropolis depend chiefly for their supply of vegetables and fruit; and the science of raising these in the most economical way has been brought to a high state of perfection. Mitcham is the centre of the simple-growing industry, and the flat country surrounding this old-fashioned town is entirely given up to the cultivation of lavender, poppies, mint, rosemary, chamomile, and recently of tobacco. A Mitcham lavender field in full bloom is a pretty sight; and local enthusiasts prognosticate that the day is not far off when Mitcham tobacco will be as current a trade phrase as Mitcham lavender.

Another old south-country industry which still flourishes on the soil of its birth, or rather of its adoption, is that of straw-plaiting and hat-making. In the counties of Hertfordshire, Bedfordshire, and Buckinghamshire, about the towns of St Albans, Hitchin, Luton, Dunstable, Amersham, and Buckingham, women and children may be seen at every cottage door plaiting and weaving in the same homely, domestic way that their ancestors plaited and wove in the days when King James I. planted the industry hereabouts through the Lorrainers he brought from Scotland. Localisation of industries seems to have been characteristic of the south, for we find that at High Wycombe, in Buckinghamshire, and not beyond a small radius round the town, the manufacture of chairs has been carried on for many years; and one may frequently meet, crossing London Bridge, a string of High Wycombe carts laden with nothing but chairs of the peculiar local type.

Passing through Hampshire and Dorsetshire, we come to Devonshire. Except for mining, Devonshire has no particular claim to be considered an industrial county, yet two old Devonshire industries, those of lace-making and the woollen manufacture, have been more than locally famous. Both of these have been recently

on the verge of extinction; but the woollen manufacture may be considered to owe its salvation to a revived appreciation amongst fashionable circles of west-country tweeds and serges; whilst the preservation of the dainty Honiton lace industry is owing entirely to Devonshire patriotism. Time was when Exeter was the national centre of the woollen trade, and when Totnes serges were famous long before Bradford or Manchester were known. But although the industry has revived and is flourishing, it is only carried on by a few houses in the three towns of Ashburton, North Tawton, and Buckfastleigh.

The utter disappearance of genuine Honiton lace was imminent some ten years ago. The long and minute labour of the human fingers could not compete with the cheap, rapid operations of the marvellous machinery in the Nottingham factories: the number of women who were versed in the old secret of Honiton lace-making began to diminish year by year; and Honiton town itself was already almost as little associated practically with lace-making as is Worstead with the woollen manufacture, or Axminster with that of carpets, or Stilton with that of cheeses. Then the Devonshire ladies came forward: lace-making became fashionable in elegant drawing-rooms; classes were formed for the teaching of the young idea; and a great impetus was given by the annual offer of prizes by the industrial section of the Bath and West of England Agricultural Society. These combined efforts have resulted in an active resuscitation of a beautiful industry; and although the town of Honiton itself is no longer the centre, the lace now made and still bearing the famous old name is pronounced to be quite equal to the product of the palmy days of the past.

A paper professing to treat of old south-country industries would assuredly be incomplete without allusion to the mining of Devonshire and Cornwall; but as our object has been rather to bring forward old industries which are comparatively unfamiliar with the majority of readers, than to include in one comprehensive survey industries about which much is already known, we may dismiss Devon and Cornwall mining as we dismissed the familiar Kentish paper industry, in a very few words. Oldest of all our old industries these are. History takes us back at least two thousand three hundred years, inference adds another two thousand, and geological evidence carries it farther back still. Devonshire tin-mining has given way to copper; lead was worked in Devon by the Romans; iron was largely mined at a very remote period, but has since been hardly touched. To these, in order to show how naturally well adapted the balmy western county is for industrial development, may be added zinc, bismuth, antimony, cobalt, arsenic, manganese, gold in small and silver in considerable quantities. These remarks apply to Cornwall as to Devonshire; but it should be added that the mining industry of Cornwall is far more active and more widely spread than that of Devonshire. Two Cornish industries remain to be noted, the one very ancient, the other of quite recent origin. The former, that of fishing in general and of pilchard-fishing in particular, has come to be regarded as so essentially a county mainstay, that it heads the Cornish toast, taking precedence of even tin and copper.

The second and quite modern industry is that of supplying London and other large cities with flowers and vegetables out of the season. This Cornwall is enabled to do in annually increasing quantities owing to the mildness and moistness of her climate; but as yet, mining and fishing have so entirely absorbed the energies of the natives, that the new department can hardly be said to have yet made a fair start, although it has long been an important source of revenue to the neighbouring Scilly Isles.

DUMARESQ'S DAUGHTER.

CHAPTER XLIV.—ALL'S WELL THAT ENDS WELL.

NEXT day, at the Orangers, Cyrus Vanrenen, with a little stifled sigh of regret, announced his intention of proceeding to Marseilles within forty-eight hours, *en route* for Amurrica, taking Sirena and Corona, in his own words, 'along with him' on his journey.

Psyche looked up as he spoke, with an astonished air. She liked Cyrus, and was grieved to think her happiness, as she imagined, should have brought about so sudden a determination on the young American's part. 'Why so soon, Mr Vanrenen?' she asked in surprise. 'You surely meant to stop here the rest of the season, didn't you?'

Cyrus hesitated for a few seconds. 'Well, when a man's ruined, you see,' he said, after a short pause, 'I guess it's about pretty nearly time for him to be moving off home to look about his business. In Amurrica, Miss Dumaresq, when an operator loses one fortune on a throw—why, he begins to think seriously in his own mind about piling up another.'

'Ruined!' Psyche exclaimed in the utmost dismay. 'Lost a fortune! Oh, Mr Vanrenen, you never told us!'

'Well, there,' Sirena put in, with a little deprecating waive of forgetfulness. 'I do declare! what a giddy girl I am! Why, Psyche, we've had such a lot to think about, last few days, if it hasn't completely slipped my memory to speak about Cyrus having dropped his fortune! He's had losses in business, home, you know—very serious losses. He'll have to go back to start things fresh; and Corona and I must go, too, to help poor mamma.'

Corona heaved a gentle sigh, regretfully. 'It's come at a most awkward moment, too,' she said. 'It would have been real nice, now, if Sirena and I could only have been bridesmaids—wouldn't it, Reeney?'

Psyche blushed crimson. As a matter of fact, so far as she had yet been officially informed, there was nobody's wedding just then in contemplation. But Sirena, paying no attention to her obvious embarrassment, continued placidly to debate that subject of perennial interest to women. 'So it would,' she echoed; 'and Corona and I'd have been real glad to be able to give you a proper sort of present. But that's all past now, unfortunately, till Cyrus can scrape up another little pile again. Corona and I had all our own money staked, of course, on Cyrus's operations. It's just downright annoying, that's what I call it, at such a moment. I should have liked folks

in Cincinnati to see in the *Observer* I'd been acting bridesmaid at a regular aristocratic British wedding.'

'Couldn't you arrange it pretty soon, Sir Austen, so as Sirena and I might stop for the ceremony?' Corona continued, looking across the table candidly at Linnell, whose awkwardness almost equalled Psyche's own. 'You'll be married here before the Consul, of course; and Sirena and I would just love to assist at it. It'd be something to talk about when we got back to Amurrica.'

'Oh, don't, dear, *please!*' Psyche whispered in an agony of shame, squeezing Corona's arm hard with an expressive pressure.—'But it isn't really so serious as all that, Mr Vanrenen, is it? You've not had any *very* bad reverses, have you?'

'Well, not more serious than being left in the world with the cash I have in hand and the clothes I stand up in,' Cyrus answered good-humouredly. 'The trouble is, I don't see now how we're to get back at all, if we don't get back right off, as we are, before we've spent the last dollar in our pockets.—Much as I should like to risk my end cent in seeing Miss Dumaresq comfortably married, Sir Austen, I kind of feel there ain't the same chance for a man like me of making another here in Algiers that there is home in Cincinnati. Africa don't offer the same scope for an operator's enterprise as Amurrica, anyhow.'

That same afternoon, Geraldine Maitland came over to see them. It was not without regret that Cyrus led that very high-toned young lady to a secluded seat at the far end of the garden, for a last interview. Now that the moment had actually come for parting for ever, Cyrus was conscious in his own mind how great a strain that wrench would cost him. 'Miss Maitland,' he said, blurting it out like a schoolboy, 'I wanted to see you alone a bit before I went. I'm off by to-morrow's boat to Marseilles on my way to America.' He said America, and not Amurrica. Before Geraldine's face, he had schooled himself now with great difficulty to the slenderer and thinner Britanic pronunciation.

Geraldine started, and her eyes fell. 'To America!' she echoed, with obvious regret. 'Is it so serious as that, then? And we won't see you this side any more, Mr Vanrenen?'

'Well,' Cyrus answered candidly, 'not till I've made another pile, anyway. Things look bad, I don't deny. We're dead broke, my partner and I—that's where it is, Miss Maitland.' He drew a long breath. 'But I confess, though I don't so much mind the worry, I'm sorry to go just now,' he continued more earnestly. 'You see, the girls 'ud have dearly liked to stop a bit over here for Miss Dumaresq's wedding.'

Geraldine's eyes were fixed on the path, and her parasol described aimless arcs among the small gravel. 'I'm sorry too, Mr Vanrenen,' she said at last frankly.

'You are?' Cyrus cried, brightening up at her sympathy.

'Very,' Geraldine replied, drawing a larger and completer circle than any yet, and then dividing it into four quarters with a painful display of minute accuracy.

Cyrus gazed at her with undisguised admira-

tion. 'Why, that's real kind of you,' he said gratefully. 'You've been good to me most always, I'm sure, Miss Maitland, and you're good to me now, to the last, much more than I expected.'

'When *wasn't* I good to you?' Geraldine asked, turning round upon him half fiercely with flashing eyes. Cyrus was too afraid to look her straight in the face, or he might have seen that small beads of dew glistened with a tremulous moisture upon the lashes.

'Well, as I said before, it ain't any use crying for the moon,' he replied evasively, twirling his stick: 'but I did think once'— He broke off suddenly. 'Say, Miss Maitland,' he went on again, after a catch in his breath, on a new tack this time; 'do you know what I'll be sorriest to leave behind, when I go to-morrow, of all the people and things I've seen in Europe—or rather in Africa?'

'Yes,' Geraldine answered, with unexpected boldness; 'I know exactly.'

'Well, it'll cost me a wrench,' Cyrus said with manful resolution.

'Why make the wrench at all?' Geraldine murmured low; and then blushed bright red at her own audacity.

Cyrus glanced back at her, half puzzled, half overjoyed. She was making the running for him now and no mistake. 'Well, it can't be helped,' he mused on slowly. 'There's no way out of it. I've got to go. I've got to leave it, cost me what it will. I can't earn my living, don't you see, anywheres but in America.'

'I meant,' Geraldine said, uprooting a pebble with the parasol end, and egging it hard out of its nest sideways, 'why not take *it*, whatever *it* may be—along with you—to America?'

Cyrus glanced sharply round at her in almost speechless surprise. 'Well, I do admire at you, Miss Maitland!' he ejaculated, with a sudden burst of joy. 'But there must be some mistake somewhere. I haven't a cent now to keep a wife upon.'

Geraldine took his hand in hers spontaneously. Her genuine emotion excused the action. 'Mr Vanrenen,' she said softly, 'I don't care a pin for that. I like you dearly. I always liked you. I was always fond of you. I was always proud of the way you thought of me. But I wouldn't accept you—because of your money. I didn't want anybody to have it to say, as all the world would have said, that I'd set my cap at a rich American. So, in spite of mamma, I wouldn't take you. But that day, you remember, when the telegram came from your partner in America, and you behaved so beautifully and so heroically and all that—never thinking of yourself, but only of Psyche, and forgetting your own trouble so bravely in hers, and doing your best for Sirena and Corona—why, that day, I'm not ashamed to say it, I loved you, Cyrus. And I said to myself, if Cyrus asks me—for I always call you "Cyrus" in my own heart'—

The young man looked back into her face with shy delight. 'Miss Maitland,' he began—

But she checked him with a little imperious gesture.

'Geraldine, you mean,' she corrected pettishly.

'Well, then, Geraldine—if I dare,' the young

man repeated, all aglow with joy. 'I don't know how to take this honour upon me; and I don't know how to say I can't marry you. You make my heart go too hard to think. But it wants thinking out. A week or two ago, I'd have given thousands to hear it. But now, I haven't got thousands to give: I know I can't keep you as you're used: I can't keep you anyhow if it comes to that. Whatever I've got is all my creditors'. But never mind. I'm the proudest and happiest man alive in all Africa this minute, if you really mean to tell me you'd let me marry you. And if you'll stick to it, Geraldine—there, I don't feel I've got any right to call you so, you're always so high-toned—I'll go back home to America right away, and I'll work like a slave, day and night, till I've heaped another pile as big as the first to come again to Europe and offer you.'

Geraldine was holding his hand convulsively now. 'No, Cyrus,' she said shortly. 'That won't do, either. I don't want that. I want to go with you.'

'You can't,' Cyrus cried in a burst of despair. 'I'd cut off my right hand to make it possible, if I could: but there's no way out.—Why, Geraldine, I'm most ashamed to say it even to you, but I wouldn't have the funds in hand to pay your passage across the water.'

Geraldine clung to him with a half-timid boldness. 'But I can't let you go,' she said, holding his hand tight. 'Cyrus, I love you. I'd never have married you then when you were rich. I'll work my fingers to the bone for you now you're poor. I'll live on anything we two can make. I'll starve, if you like. But I can't let you go alone. I *must* go with you.'

Cyrus soothed her hand between his own caressingly, and raised it with true Western chivalry to his lips. 'You shall,' he answered, making a bold wild shot. 'Geraldine, we'll manage it, if we have to go steerage. I never felt so proud in all my life before. I don't know where I'm standing when you tell me you love me.'

What further might have happened at that precise and critical moment, history trembles to say: had it not been that just as Cyrus dropped Geraldine's hand, and leant forward with some apparent intention of sealing his compact by more vigorous measures (which the present chronicler declines to mention), Sirena rushed up, all hot and breathless, and threw an envelope into his lap with a penitent air of sudden recollection. 'Say, Cy,' she cried, in a somewhat panting voice, 'I'm so sorry I forgot it. It's all my fault. I meant to have mailed it to meet you at Constantine; and I put it into an envelope for you just like you see it; but it came that day, you know, when Psyche was so ill; so I stuck it right there into my pocket without thinking; and from that moment to this I utterly forgot all about it. Just now on the tennis court I pulled out my handkerchief; and there the envelope dropped out, sure enough, after lying all that time in my pocket still, for I haven't worn this dress before since the morning it came: and I'm real sorry, but I hope the telegram ain't a very important one.'

Cyrus unfolded it and glanced at its contents in profound astonishment. As he read, he

whistled. 'It's from the old man, Sirena,' he murmured, amazed. 'Just look what he says. One can hardly believe it.'

Sirena took the paper and read it aloud: 'First wire premature. Jay Gould taken over affairs. The squeeze has burst. Ring operations liquidated at par. Fifth National Bank set up square on its legs again. Panic allayed. Business easy. The old house as solid and firm as ever. Hooray!—ESELSTEIN.'

'Why, what does it all mean?' Geraldine asked feebly, failing to take in the strange accidentalisms of the telegram all at once.

'It means, my dear, Cy's as rich a man as ever he was a month back,' Sirena answered, delighted, grasping at the full sense with Western quickness.—'And say, Corona,' as her sister and Psyche came up unexpectedly, 'ain't it just fine? We can stay after all to see Psyche married.'

Geraldine's face grew suddenly flushed. 'And so you're really rich again—Mr Vanrenen?' she murmured.

'Well, that don't tell against me, anyhow, does it?' Cyrus asked crest-fallen, with a somewhat anxious and half-regretful look.

'Not now,' Geraldine answered, a little faintly, though not without a tinge of disappointment in her voice. 'Only—I'd rather, you know, if it *could* have been managed, it had been the other way.'

Psyche looked across at her friend with a puzzled look. But Corona took in the true state of affairs at once with prompter womanly instinct. 'I guess, Sirena,' she observed philosophically, glancing quick from one blushing girl to the other, 'we two'll be bridesmaids at both these weddings.'

THE END.

ON CARE OF THE HANDS.

No one need ever be ashamed of having pretty soft white Hands. Some people have an idea that they are a disgrace, being a sign that the individual who owns them is a useless member of society, shirking all the hard work of the world, and selfishly leaving the disagreeables of life to be taken up by others. It is not so, however. Some of the most useful and capable hands in England at the present moment are soft and white. It is quite possible for hands to do a good deal of hard work and yet be well kept and far from displeasing. The fact is that the condition of the hands depends quite as much upon their being properly cared for as upon the sort of work they do. 'Who sweeps a floor,' and goes about it in the right way, may make it properly clean, even though her hands are agreeable to touch and pleasant to kiss; and the said hands will not be permanently injured by the task, if only the sweeper will be at least as careful of them as she is of the carpet.

It is a proof that the bestowal upon them of a little pains does much to preserve hands in good condition, that there is a difference in the hands of men who tend furnaces in iron foundries. Perhaps there is no work of which we have any knowledge that is more likely to leave its mark than is this. The coal-dust filling the

pores of the skin produces griminess and discoloration, not easily eradicated. Yet those who know say that the workmen who, when washing their hands after working, rub a little oil or glycerine into them while doing so, and dry them thoroughly and carefully, have hands much softer and less 'horny' than have those who take no precautions of the sort. If individuals who are thus unfavourably situated can improve their hands, surely ordinary folks might be encouraged to try what they can accomplish in the same direction.

Nor need reasonable and effectual care of the hands occupy an undue amount of time. There are people of course who think too much of this business. The 'manicure' in these days is quite a professional, and fashionable ladies will devote much money and many hours each week to the care of the hands, hours which ought to be more profitably employed. These experts have ivory instruments to push back the skin which adheres to the nails and hides the white crescent. They have leather and a powder wherewith to polish the nails, and files for sharpening and rounding them. They produce excellent results, without doubt. A hand scientifically cared for is often very beautiful; yet busy people would say that this particular whistle cost rather too much. Much simpler methods would satisfy busy persons, and for these only a few suggestions may here be given.

The first point requiring attention for the care of the hands is that they should not be allowed to remain dirty. Many avoid washing their hands frequently because they think washing makes the skin rough. Unnecessary washing certainly is not desirable; but if the hands are washed in tepid not hot water, dried perfectly with a soft cloth after washing, then dusted lightly with violet powder, they will be injured less than would be the case if they were left dirty. It is an excellent plan to wear gloves when possible during work. They save friction very much; and if the tips of the fingers are cut off, they do not impede progress. Vigorous workers often have a great scorn for workers in gloves, and quote against them the proverb that 'a cat in gloves catches no mice.' The scorn is misplaced; a hand is not rendered less capable by being guarded from injury.

An efficacious way of making hands soft is to rub them with glycerine while they are wet, after washing with warm water and soap. Glycerine, it should be remembered, is a valuable toilet accessory. There are very few hands so hard that they will not be rendered soft by rubbing glycerine in regularly every night for ten or twelve nights. When this is done, gloves must be worn, to prevent the bed-linen being made greasy. Some people find glycerine too heating; they say it makes the skin smart, and find it very irritating. Under these circumstances, oatmeal may be employed instead. Oatmeal will not answer quite so well as glycerine, but it will be very helpful. A writer in one of the medical journals, speaking on this subject not long ago, said: 'The best preparation for the hands at night is white-of-egg with a grain of alum dissolved in it. Quacks have a fancy name for this; but all can make it, and spread it over their hands, and the work is done.' The Roman

Toilet Paste made by quacks is merely white-egg, barley-flour, and honey. They say this was used by the Romans in the olden time. Anyhow, it is a first-rate thing; yet it is sticky, and does not do the work any better than oatmeal. The roughest and hardest hands can be made soft and white in a month's time, and all the tools needed are a nail-brush, a bottle of ammonia, a box of powdered borax, and sand or lemon for the stains. A little ammonia or borax in the water you wash your hands in, and that water just lukewarm, will keep the hands clean and soft.

Next in importance to the softness of the hand is its whiteness. Glycerine, it should be understood, is valuable for softening the skin; it does not affect the colour; and it is much easier to make a hand soft than it is to make it white. Red hands are generally caused by imperfect circulation, and young girls frequently have red hands on this account. In order to make the hands white, therefore, the aim should be to improve the general health, to keep the extremities warm, and to avoid exposure. To let the hands get sun-burnt is a very certain way of spoiling their colour. For some days after the actual burn has died away, the hands which have been affected thereby retain a sort of dirty brown, which is not beautiful. To keep the hands white, therefore, gloves should invariably be worn in the open air; and according to Dr Buck, silk and woollen gloves are less valuable as a protection than kid. Yet even kid gloves do more harm than good if worn too tight.

An authority recently declared that to whiten and soften the hands, the following treatment is the best that can be recommended. Wash in tepid water always, and with a powder puff apply fine oatmeal. After washing, dry and rub the hands briskly. Use rather warmer water at night, and use a nail-brush all over the hands. When dry, apply almond paste, and sleep in easy-fitting gloves. To make the almond paste, take two ounces each of sweet and bitter almonds; pound in a mortar to a paste; mix with half an ounce of Windsor soap cut into fine shreds; add two drachms of spermaceti, half an ounce of oil of almonds, and twelve drops of oil of bergamot. Heat gently; add the essential oils last, and stir till cool.

The state of the nails has a great deal to do with the beauty of the hands. To cut nails with scissors thickens them. They should be filed, rounding them off at either side to follow the line of the finger and making them level with the edge of the fingers. If shorter than this, they would be ugly. It goes without saying that they should be kept scrupulously clean. Every morning after washing, and while the skin is still soft, the cuticle at the base and side of the nail should be pressed back gently with the hem of a soft towel. Rough treatment of this part of the skin will produce the disagreeable 'hang-nails,' which are a great annoyance when they occur. There are people who bite their nails. Those who have not patience to conquer the habit will not care to adopt the means necessary for making their hands pretty.

Chilblains on the hands, like redness of the hands and 'chaps,' are the sign of imperfect circulation. If the whole body, and especially

the hands, could be kept uniformly warm, chilblains would disappear; and the best way to cure them is to prevent them. The difficulty is that in cold weather the hands and feet, the parts chiefly affected by chilblains, are the parts most likely to be cold. The *Family Physician* says: 'Sufferers from chilblains should have plenty of good warm underclothing, and should not be afraid of wearing good big gloves lined with wool. Tight kid gloves are an abomination. They may be pretty to look at, and no one can help admiring a nice little hand; but they prevent the free circulation of the blood and make the fingers horribly cold. There is another thing: do not wear elastic bracelets or tight garters. If you want to get rid of your chilblains you must take plenty of outdoor exercise.'

There are many so-called cures for chilblains. One of the best is sulphur ointment, rubbed in two or three times a day, a glove being worn over the hand meanwhile. Another excellent remedy is made by thoroughly mixing equal quantities of capsicum lotion—made by soaking capsicum pods in spirits of wine—and dissolved gum, then painting the lotion upon tissue-paper two or three times. The paper may be used as court plaster.

Warts on the hands are very ugly excrescences, and there are as many remedies for them as there are for chilblains. One of the easiest of applications is strong acetic acid, to be dropped on gently with a little tube until the wart is almost saturated with it. The treatment is to be repeated for two or three days. Care must be taken to preserve the skin surrounding the wart from being touched with the acid, or it might be burnt. Many try to burn away warts with lunar caustic. After being thus treated the warts generally reappear.

THE TROUBLE AT GREAT BUCEPHALUS.

BY HENRY TINSON.

IN FOUR CHAPTERS.—CHAP. I.

It can hardly be said that Great Bucephalus, an American frontier 'city' well known a generation back, was founded with greater pretensions and boasting than any other speculation of the kind, as nearly all such places are promised to do impossible things, and to realise unheard-of profits for all those who joined in the undertaking; but it went ahead pretty considerably smart in that connection, as some of the more astute critics had said, in reference to the scheme. Mining was to make its fortune, and so would trading with the farmers who sent in their produce to supply the miners; so the store-keepers, the hotel-keepers, and the cattle-dealers could not avoid making money—so it seemed—even if they wished to do so. And it was strange, or would have been strange but that the incident was common, to see how those who had already been deceived, or at least disappointed in similar ventures, were ready to believe in this new speculation, and eager to try their fortunes in it.

Among others, Mr George Eltran, an Englishman, had been early in the field, and had opened a store, managed principally by himself and his

wife; and so great was the rush—or 'boom,' as it is now the fashion to call it—while Great Bucephalus was developing, and the miners were prospecting, that the speculation appeared likely to realise a great deal even of the enormous success predicted. This was cheering to Eltran, who had had his share of heart-breaking struggles; but he was also delighted to think that here was now an opening for his best and oldest friend, Mr John Boytell, of London—'Jack Boytell,' to all who knew him. This friend was somewhat Eltran's junior; but they had been school-fellows, and Jack had married Eltran's sister, and was liked all round for his good-humour, his straightforward style of speech, and his unflagging cheerfulness of manner—all capital qualities; and, as just intimated, Boytell was much liked on account of them; but, unfortunately, even a cheerful and pleasant manner does not always of itself secure success in business, and Boytell had made more than one experiment which had ended in undoubted failure; his capital would not allow of many such trials, and as he had a wife and a couple of children, the outlook grew serious.

Eltran was delighted at being able to send his friend a letter containing a glowing account of the new city and its prospects, with a strong recommendation for him to try his fortune in the West, where, he somewhat rashly declared, such a man as Boytell was sure to make his fortune. This information and this invitation were specially welcome to his friend, who was really, as he owned, almost at the end of his tether; and Eltran soon received a letter in reply, heartily thanking him, and announcing the writer's intention of embarking almost immediately. Polly (Mr Boytell's wife) was, he averred, quite as much pleased as himself; and so was Agatha, Eltran's unmarried sister, who would accompany them.

But events move very quickly in such communities as Great Bucephalus, and of all speculations, mines are perhaps the least to be depended upon. Boytell's letter had only been received a day or two, and the glow of pleasure with which Eltran and his wife had learned his resolve had not died away, when suddenly and from all quarters the most ominous rumours sprung up; a general stampede from the mines was commonly spoken of, and it was certain that in some quarters the diggers—or, as was more often the case there, the gold-washers—were leaving their claims. Gold assuredly was to be found in the district, but so irregularly and in such limited quantities, that it was soon seen that for such a 'boom' as had taken place the enterprise was wholly hopeless. When once such a belief becomes current, the speculation which has gone up like the rocket, does indeed come down like its stick.

This disappointment would as a matter of course be sufficient to stamp the gold-fields and their dependent town as a failure; but even worse than mining losses was the rumour, only too well founded, that the Indians had broken from their reservation—had already committed, after their wont, some awful outrages, and had declared their intention of burning Great Bucephalus. That the savages had been goaded to these deeds and threats by a long period of

injustice, fraud, and ill usage, was undeniable; but this made it no better for the unfortunate residents who were likely to suffer; and, moreover, 'out West' nearly all the whites held that such treatment, even if carried to extermination, did not matter so long as it was only practised on Injuns. Retaliation was of course a very different, and a most brutal and barbarous affair.

Yet even in this community, some—a very few—were suspected of being in sympathy and even in confederacy with the tribes; and if this were proved, short work was likely to be made with the renegades. One notorious character, a 'desperado,' and what would elsewhere be called an outlaw, was Adobe—more commonly 'Doby Rube, so called from his having worked some time at making the adobes or large unburnt bricks of the West and of Mexico; and this man was strongly suspected of treachery; but he lived a mile or two out, and rarely came into the town, where, in its early history, he had been engaged in two or three sanguinary broils—'shooting scrapes' would better render the vernacular of Great Bucephalus—thus, being seldom seen, and the district growing depleted, he had hitherto escaped the lynching of which he ran daily risk.

Eltran knew but little of the man, did not even know where he lived; but one afternoon, when he was driving home with his wife from a visit they had paid to a ranch a few miles out, a man came to the door of a miserable hut and hailed them. Eltran at once recognised Adobe Rube, and, reining up, asked him what he required. 'Seeing madam with you,' returned the outlaw, 'I thought mebbe she would look at my Minnie, who is sick.—It is no fever or small-pox, madam,' he continued, lifting his slouch-hat as he spoke, 'or I would not ask you to see her. She is a kind of weak and pining; perhaps she wants some wine; perhaps some doctor's stuff. You will be able to tell when you have seen her; and then I hope that even for the daughter of 'Doby Rube, a poor child who lives alone and solitary with her hunted father, you will send out what she needs.'

Eltran looked doubtfully at his wife, as though he expected to hear her express the strongest disapproval of this idea; but the lady met his glance with a very different one. 'Poor child!' she exclaimed. 'How dreadful for her to be suffering here alone, with only'—

She paused, and Adobe Rube, who had caught the words, smiled gravely, and said: 'With only such a father to nurse and look after her. It is true, madam, we are shunned by all; and so she suffers for my faults; but I have done my best.'

'I feel sure you have, Rube, and I will help the poor girl if I can,' returned Mrs Eltran, somewhat remorseful at having allowed the man to divine her thoughts; 'and if I can send her anything likely to do her good, she shall have it.' Saying this, she descended from the vehicle, and followed Rube into the hut. Eltran shook his head, but ventured upon no open protest against the proceeding.

After a short interval, during which he could distinctly hear the feeble voice of the sick child mingling with the others, his wife came to the door, and said: 'George! The poor little girl is sadly ill. She seems only weak and very low-spirited; but she is certainly pining away; and

if left here, she will die. I have told Rube we will drive her into the city, where she can have one of our rooms for a while; and with cheerfulness and society, she will get strong directly.—Spread out the buffalo robe so that she can lie upon it, for she is too weak to sit up.'

'What! Take her to Bucephalus with us? Take her in *now*!' exclaimed the amazed husband. 'Don't you think it would be better to send her out some wine, and to ask Dr Prance to call; and then'—

'No, no!' cried his wife impatiently. 'The poor child will be dead while we are thinking of helping her; and she looks so pretty and speaks so mildly.—That will do nicely,' she added, as her husband, seeing there was no escape, adjusted the buffalo robe. 'Rube will bring her out.'

The father, concealed from Eltran by the shade of the low doorway, had been listening to this conversation, and watching the speakers with a painful interest. He drew back into the house, where Mrs Eltran followed him; and in a few minutes they returned, Rube carrying—much too light a burden—a girl of some ten years old, pretty in features, and with soft curling hair; but pretty as was her face, it was far too pinched and drawn for youth, and her blue eyes were too large and too eager.

The burly miner easily lifted the slight figure into the vehicle, bent over and kissed her face with some words of farewell and hope; then brushing something away from his eyes and clearing his throat, he drew a small leather bag from his pocket, and handing it to Eltran, said: 'There is not much there, squire—not more than an ounce and a half of dust. In better times it should have been doubled and trebled; but it will help to pay for my little Minnie's board and for the trouble to your helps.'

'No, 'Doby—not a cent!' cried Eltran. 'If we give your child a home for a while, we do not wish for any money return.—Do we, Kate?'

'No,' replied his wife, emphatically. 'We will not take money for anything we can do for the sickly girl; for any help we can render to'—

'To the innocent child who has no friends,' said Rube, with the same uncheery smile as before. 'Well, I will not press you. Your good deed shall stand by itself; and if ever the day should come when even such a man as 'Doby Rube can show that he is grateful— Yet I must not keep you here, listening to my promises. Good-bye. I wish you the greatest prosperity; but I tell you straight I don't reckon that you will find it at Great Bucephalus.'

The strangers drove off with their charge, after this not too exhilarating farewell; and thus the only child of Adobe Rube, the hardened homicide, and—far worse in Western eyes—white Indian, came to be for a few weeks an inmate of the Eltran store; and a wonderful improvement in the girl was the immediate result. She improved in her looks so rapidly, and was such a gentle affectionate child, that those who had at first been disposed to censure the Eltrons for taking an interest in the daughter of such a scallywag as 'Doby Rube, not only surmounted their objections, but came to see the girl occasionally, nearly always bringing her little presents.

This short visit was probably the very happiest time which Minnie's life had yet seen; but she was removed too early, as the Eltrons judged, Rube expressing his regret for the change, which was, he said, from some reason unavoidable. He did not say what this reason was; but he was profuse, and apparently sincere, in his thanks to the kindly couple, and reiterated his assurances of repaying the good turn should it ever be in his power.

It seemed as though Eltran would need a good turn pretty soon from some quarter, as, while Minnie had been staying at his house, the state of affairs in and about Great Bucephalus had reached something like a crisis. The gold-fields were almost deserted; trade, as a matter of consequence, was almost extinct; while the reports from the Indians grew more terrible—were indeed growing worse day by day—and the calamities threatened appeared on the eve of accomplishment.

One of the first precautions taken by Eltran was to write, warning his friend Boytell not to come on at present, not, indeed, until he heard from Eltran again; for it was clear enough that the latter would have to seek another home, and that, for some time at least, Great Bucephalus would be no eligible abiding-place for such immigrants as John Boytell; and still less would it form a resting-place for the helpless women and children dependent upon him.

Eltran feared it was too late to write to England, as his friend had probably already sailed; but he wrote to the agents in New York upon whom Boytell would call, advising him to wait in that city a while. This was all he could do at the time; but he assured Boytell that he would not lose a moment in sending advice for his guidance as soon as he had decided for himself. It had now become too evident that a change would be necessary, as, apart from the ruin threatened by Indian hostility, the failure at the gold-fields had grown so complete that the trade of Great Bucephalus was hopelessly gone.

But even this latter disaster did not utterly dismay the residents, who were in many cases of roving habits, and looked upon the 'playing out' of the town as only adding one to their many removals. It was the dreaded storm of the savages' onslaught which appalled them; and it was out of all question for Eltran to allow his friend Boytell and family to run into such danger; so, awkward and expensive as a stay in New York would be, Eltran was heartily thankful that the alarm had been given early enough to enable him to send warning.

It was now reported that Ophirville, a new town some forty miles south, was the real centre of the gold-bearing districts, and would be the centre also of trade and enterprise. What was of equal importance just now, it was below the range of Indian fighting parties, who never sought to cross the boundary supplied by a long range of low hills. The savages did not claim the country beyond that division, and consequently allowed the dwellers therein to abide in peace. So, after obtaining the best accounts he could, Eltran made up his mind—'concluded,' as he had already learned to say—to start afresh there, and was soon busied in the necessary arrangements.

Yet even in the few days which were all that these preparations required, reports of the Indian outbreak increased in frequency and in terror. Some of them seemed almost too horrible to be true; but those who were old residents on the frontier had often had only too good reason for believing this class of report beyond all others.

One unpleasant incident, which fortunately, however, led to no special result, occurred in the city itself. A party of the leading citizens waited upon Eltran, and requested that he would give up to them Minnie Trant, the daughter of Reuben Trant, otherwise Adobe Rube. Eltran informed them that the child had been taken away by her father a few days before. The deputation were loth to believe this; and Eltran was obliged to swear that it was so and to call his wife in evidence ere they would credit him. They knew—and he knew as well—how the Vigilantes treated a broken or false oath. There was but one penalty—death.

‘We are going to lynch that outlaw and desperado,’ said the leader; ‘we will so. We shall string him up whenever he is caught; but we don’t bear no malice against this child, who shall be sent five hundred miles away, where she will never hear her father’s name, and will soon forget all about him. Our visit here is out of no ill-will to you, Squire Eltran. This deputation admires the kindness shown by your wife and yourself to this poor little girl; and we regard you as real white citizens for sheltering and nursing her.’

This last phrase may have an odd sound to unaccustomed ears, especially as there had never been any question as to the ‘white’ blood of Mr and Mrs Eltran; but it was an often-used form of Western speech, and was intended to convey a compliment. The search for Adobe Rube was unavailing, and the store-keeper heard no more at that time of him or his child.

THE GOVERNMENT LIGHT RAILWAYS IN IRELAND.

WORK is now vigorously proceeding in the south of Ireland on the Light Railways, designed and financed by the Imperial Government with a view of affording employment during their construction to the inhabitants of the districts traversed, no less than to benefit permanently the localities served by opening up cheap and rapid means of transit to and free communication with the outer world and its markets. In the present article we propose to place before our readers some brief account of two important lines in the extreme south-west of Ireland: the West Kerry, and the Kenmare and Headford Railways, both typical Irish lines, and though distinct undertakings, yet presenting many features of similarity. After succinctly following the route traversed by each line, and pointing out the more interesting facts in connection with them, we shall conclude our notice by some general remarks applicable to this class of engineering and the development of Southern Ireland.

The West Kerry line forms a branch of the Great Southern and Western Railway of Ireland, and is being constructed by that company under

subvention from the Imperial Government. The new line is twenty-seven miles in length, and traverses throughout its entire course a country singularly rich in natural beauty. Starting at Killorglin, the present terminus of the Great Southern and Western Railway, a quiet market-town near the mouth of the river Larne, famous for salmon, the new line passes in a southwesterly direction until the Caragh River is skirted and crossed, in full view of the well-known Macgillicuddy Reeks, whose topmost summit, Carn-tual, attains to a height of over three thousand four hundred feet. The line now crosses the bogs, the special difficulties of which and the mode of overcoming the same are dealt with later on; and passing the river Behy, a rocky mountain torrent, winds around the forest-clad mountain which overhangs the river. Still continuing in a similar direction, the route passes along the face of Trunk Hill, a little above the public road, from which it is separated by a stout retaining wall. The scenery at this point is well worthy of some passing comment. The public road is cut in the side of the mountain, and far above tower its summits; while deep down below in sheer descent are the rocks and glistening waves of Dingle Bay, across which, on the opposite shore of the estuary, rise Mount Brandon and the undulating green-clad heights surrounding it, all soft in purple haze and fleecy banks of cloud. Before leaving Trunk Hill, two short tunnels occur, which are of special note only as being the sole ones throughout the route.

The next point of interest is the beautiful ravine of Gleeske, whose precipitous sides, thick with Scotch and silver firs, run sheer down into the blue waters of Dingle Bay. The railway crosses the head of the ravine, and thence winding along the valley, minor cuttings and banks alternating with each other, passes Kells, and running across Valentia River at a considerable angle, enters Caherciveen just below the imposing police barracks of that town, and about a mile from Charran House, a spot dear to every patriot in Ireland as the birthplace of Daniel O’Connell. The route now traversed skirts the left bank of the Valentia River, which gradually widens itself out into an estuary of the Atlantic until Reenard Point, the extremity of the mainland, and terminus of the West Kerry line, is reached, opposite Valentia Island, on the west coast of Kerry, and famous as the starting-point of the Atlantic Cable.

Valentia Island and its land-locked harbour form a fitting terminus to a line singularly rich in the beauty of its surroundings. The island, which is about six miles in length by two miles in breadth, containing over six thousand acres, is remarkable for the mildness of its climate, no less than for its natural beauty, and can hardly fail, when the new route is opened, to become a favourite resort of tourists, who at present are debarred by the inaccessibility of this remote spot from finding their way to it.

The whole district, indeed, traversed by the West Kerry Railway will without doubt become popular with travellers in search of new scenery so soon as the inherent beauties of the route become known; whilst to sportsmen, a country whose rivers teem with salmon and trout, and whose mountains and bogs afford

excellent rough shooting, the increased facilities to be given by the line now under consideration will be justly appreciated, no less than by the farmers and traders in the rural districts and towns, who will find a demand springing up for their produce, coupled with cheap means of transit for the same.
